JOHN J. THOMAS AND M. B. BATEHAM;

ASSISTED BY DAVID THOMAS AND OTHERS.

VOLUME 1.

PUBLISHED BY BATEHAM & CROSMAN,

ROCHESTER, N. Y.

1840.

INDEX TO VOLUME I.

A.

Advertising, importance of, 37.
Agricultural museum at Rochester, proposed, 2.
..... papers, benefits of, 1, 6, 1-2.
..... importance of in the Gen. country, 21.
..... and warehouses, 99.
..... pursuits, to make pleasant and profitable, 7.
..... improvements in Europe, 13.
..... remarks on, 35.
..... expense of, 70.
..... Chemistry, Davy's new edition of, 36.
..... societies recommended, 42.
..... notices of meetings, 152, 153.
..... Society in Monroe county recommended, 41, 60.
..... in Yates county, 60.
..... Highland, account of, 102, 111.
..... Genesee county, 120, 1-7.
..... of Ontario county, officers of, 111.
..... account of, 172.
..... of Durham, U. C., 172.
..... English, great exhibition of, 152.
..... meeting at Rochester, call for, 65.
..... remarks on, 73.
..... account of, 82.
..... fair at Rochester, premiums offered, 120, 152.
..... notices, 129, 111.
..... account of, 161, 162, 171, 176.
..... in Chauauque county, 1-2.
..... fairs in Germany, 111.
..... experiments, importance of, 101.
..... intelligence office recommended, 106.
Agriculture, progress of, 32.
..... in Ontario county, offer of G. Hentz, 67.
..... in Upper Canada, 19, 108, 116, 117, 131.
..... in United States, census of, 70.
..... European, notes on, 102, 111, 114.
..... legislative aid to, recommended, 113, 154.
..... needs science, 123.
..... in Scotland, 151.
..... see "Farms" and "Farming" in this Index.
Agents in Canada, 157.
Animals, sick, treatment of, 142.
"Annette," reply to, by "Fanny," 123.
Aphides, or plant lice, account of, 83.
..... destroyed by the lady-lug, 140.
Apple, Hannah, description of, 116.
Apples, pruning in winter, 18.
..... sweet, value and cheapness of, 18.
..... notices of fine varieties, 2, 1-0.
..... native varieties described, 103.
..... winter, to preserve, 157, 1-0.
Apricots, varieties of, 140.
Ardent spirits good for rats, 53.
Asparagus, early, 61.
Auger holes, making with a gimlet, 159.

B.

Barley, Chevalier, 71.
..... Annat, 71.
Barn cellars for roots, 29.
Barns for horses and cattle, improved mode of making, with figure, 40.
Bee moth, simple remedy for, 35.
..... house & bee-hive, improved, figure, description of, 136.
..... keeping, profits of, 155.
Beets, descriptions of varieties, 57, 52, 113.
..... bread from, 66.
..... Bassano, excellent, 140.
Birds, new species of, 3-7.
..... of America, by Audubon, 57.
..... and toads, usefulness of, 63.
Book farming, 1-3.
..... fine specimens of, 174.
Boots and shoes, water-proof compound for, 9.
..... wrong end foremost, 13.
..... grafting—was excellent for, 52.
Borrowing worse than buying, 31.
..... and lending, neighbors should accommodate, 37.
Buck, Thos. Wadhams, Leicestershire, with a figure, 155.
Buel, last speech of, 10.
Burnt earth as manure, experiments, 121.
Butter, restoring sweetness to tainted, 37.
..... to prevent taste of turnips in, 62.
..... salting and preserving, 57, 97.
..... making, by Adam Fergusson, 134.

C.

Cabbages for pigs, 122.
..... to protect from grubs, 123.
Calves, rearing, 151.
..... large, 112, 125, 1-0.
..... successfully reared on milk and meal, 70.
Canada thistles, to extirpate, 89, 111, 117.
Carrot, large white green top, noticed, 55.
..... long Altringham, 5-7.
..... new large white, 150.
..... culture recommended, 11, 21.
Caterpillars, disappearance of, 106.
Cattle; disease and post mortem examination of, 62.
..... remedy for, 85.
..... remarks on, 113.
..... to cure foot rot in, 99, 109.
..... management of, 141.
..... hoven, new remedy for, 179.
..... show at Rochester, account of, 161.
..... Durham; engraving of "Sir Walter," 44.
..... notices of, 67.
..... various and great calves of, 114.
..... Devon bull for sale, 61.
Cauliflower, successful culture of, 9.
Celery, culture of, 30.
Cheese, directions for making, 163.
Cherries, varieties of, 111.
Cherry trees, excessiveness on, 109.
..... slug, see "Fruit Trees" in this Index.
Choice of an occupation, 7.
Cider press, 9-8.
Cistern, water-lime, description of, 116.
Clover, different varieties of, 30.
..... White A'sike named, 11, 110.
..... time of cutting, 66

..... as manure, 170.
..... best grown with orchard grass, 175.
..... seed, process of cleaning, 131, 150.
..... and machines, 133, 150.
..... quantity raised, 163.

COOKERY.

To make Johnny cakes and Indian pancakes, 23.
..... rice apple dumplings, 37.
..... Johnny cakes without milk, 53.
..... dough-nuts, 5-7.
..... oyster corn cakes, 92.
To spice beef Irish fashion, 63.
Corn, Tuscarora, value of, 7.
..... China tree, queer properties of, 12.
..... down east, 3-8.
..... successful culture, mode described, 9.
..... puzzle, 16.
..... importance of selecting seed, 31.
..... good crop of, 31.
..... grinding in the cob, 62.
..... directions for the culture of, 62.
..... best varieties of, 70.
..... hints on planting, 72.
..... machine for husking, 57.
..... to repel crows from, 123.
..... laws, British, 1-8.
..... great crop of, 1-7.
Correspondents wanted, 2.
..... notices to, 96.
Couch grass easily destroyed, 50.
Cows, to cure eaking of udder, 77, 59.
..... first and last portions of milk, difference in, 79, 150.
..... great winter product of, 79.
..... good and bad, profits illustrated, 157.
..... should be milked clean, 1-0.
..... to prevent kicking, 1-7.
..... Durham; great product of "Blossom," 113
..... engraving & account of "Dairy Maid," 169.
..... Dairy Maid against Blossom, 170.
..... productiveness of "Young Lily," 149.
Cranberry, bush, cultivation of, recommended, 51.
Cream, why does it rise? 155.
Crops and season, 112, 113.
..... in South Venice, 156.
"Cu Rivator," notice of, 29.
Curculio, successful extirpation of, 34, 71, 92.
..... to prevent, 122.

D.

Death of John Lowell 61.
..... E. P. Marshall, 111.
..... Dr. Perrine, 141.
Dialogues between a father and son, 64, 110, 120, 159.
Diet, regulation of, 11.
Digging and hanking machine, 62.
Domestic Economy:—
..... to clean papering of rooms, 19.
..... marking bags, &c., 19.
..... restoring tainted butter, 37.
..... to apply black lead to stoves, 52.
..... to remove ink spots, 5-7.
Door-yard scenery, engraving and remarks, 51.
Drag roller, 130.
Draining lands by steam-power, 95.
..... remarks on, 121.
Drowned, restoring life to, 112.

E.

Eaton's Botany, new edition of, 44.
Eggs, hatching by steam, description of, 12.
..... to preserve, 63.
Electricity, remark, 103, 101.
Elsworth, Henry L. 175.
Encouraging letter from W. Garbutt, 154.

F.

Fanning-Mill, p. Patterson & Co's, 158.
Farewell readers! 1-8.
Farm crops, varieties of, 111.
..... labor, value of, 170.
..... origin of the word, 7.
..... accounts and profits, 7-2.
Farmer, the life of, 29, 122.
..... good specimen of, 151.
Farmer's Companion, review of, 30.
..... Cabinet, 93.
..... sons, 112, 11-7.
..... daughters, 1-7, 6, 109, 119, 129, 175.
..... and wives, 151.
..... and mothers, 1-7.
..... and homes, 155.
..... reading, remarks on, 179.
Farmers, tribute respecting, by John Todd, 43.
..... education of, 62.
..... should study some, 122.
..... distinctive character of, 179.

Farming, hints on, for January, 3; Feb., 1-2; March, 40; Apr., 49; May, 72; June, 59; July, 104; Aug., 121; Sept., 149; Oct., 116; Dec., 178; for next year, 1-3.
..... successful, 79, 1-5.
..... on a small scale, 119.
..... its advantages, 133.
..... of Coke, great increase, 161.
Farms in England, 1-3.
..... new, improving.
Fence posts, to preserve, 69, 77.
Flower Seeds, to sow, 59.
Flowers of Spring, 56, 72, 92, 117.
..... of Summer, 101, 121, 132, 142.
..... of Autumn, 116, 162.
..... and shrubs recommended, 147.
..... notice of new and rare species, 178.
Forests, importance of, and mode of sowing seed, 22.
Frosted feet cured by pepper-milk, 58.
Fruit trees, treeling snow round, excludes mice, 3.
..... from entrees, all humbug, 21.
..... great number of varieties, 34.
..... management of, 31.
..... retarding the bloom of, 59.
..... slugs on, 71, 92, 105, 107, 125.
..... to destroy the curculio, 71.
..... plugging, 53.

..... dwarf, 123.
..... encouragement to planting, 142, 402, 173.
..... splitting down, 116.
..... to transplant successfully, 148.
..... and directions for a small fruit garden, 178.
Fruits as food, 175.
Fuel, comparative advantages of green and dry, 17.
Furnaces, hot-air, figure and description of, 143.

G.

Gardening; sowing flower seeds, marking sticks, &c. 56.
..... for March, 10.
..... for April, 56.
..... for May, 65.
..... for June, 93.
..... edging for borders, 69.
..... different soils, 72.
..... transplanting annuals, 112.
..... best soil for, 162.
Garget, cure for, 10-7.
Gate latches, 179.
Golden rule applied to farming, 122.
Good sentiments, 39.
Grafting on wild cherry, failure of, 21.
..... useful directions, 40.
Grafts, cutting in Autumn, 117.
Grain, measuring in the granary, 151.
..... weight of, 1-0.
Grape, easy culture of, 31, 93.
..... vine, productive, 119.
..... jelly, 147.
Grass, different varieties of, 36.
..... correction, 61.
..... orchard, inquiries and remarks, 133.
..... growing, with red clover, 175;
..... culture of, 119.
Grasses, dried specimens from Prof. Dewey, 73.
..... figures and descriptions of different species, 73, 59, 106.
Green house, enormous, 51.
Grub worm, to destroy, 123.
Gypsum, effects of, 163.

H.

Hail stones, velocity of, 127.
Hans, smoking, to prevent the fly, 3.
..... dampness, 3.
..... in a pork barrel, 1-0.
..... to preserve from the fly, 19.
..... for summer use, 76, 154.
Hard times, remedy for, 2, 9.
Hay, making in England, 13.
..... instructions to young mowers, 89.
..... great profits of chopping, 77.
..... directions, remarks, and inquiries, 55.
..... timely, proper time for cutting, 92.
Head-holder to the king, 31.
Hen-house, description of, 1-3.
Henry, not Henry, description of, 171.
Hens, how to manage successfully, 13.
..... to prevent scratching, 5-7.
..... management of, by T. P. Hunt, 56.
Hen's eggs, male and female to distinguish, 100.
Hessian fly, observations on, 1-3.
Hints for the months, 3, 15, 33, 40, 49, 72, 89, 104, 121, 140, 146, 17-8.
Hogs, large sale of Berkshires, 133.
..... disease in, inquiry, 161.
Hog, a large one, 155.
Hoof-ail prevented, 24.
..... inquiry, 1-5.
Horse, rearing, to manage, 16.
..... only two faults in, 23.
..... bulky, cured, 39.
..... improved, 67.
..... broken by kindness, a fine fellow, 66.
..... power, Arnold's, figure and description, 67.
..... rake, revolving, engraving of, 37.
..... thistle, to kill, 12-8.
Horses, watering, 47.
..... beware of short collars, 63.
..... cure for yellow water in, 81.
..... improved, wanted, 83.
..... care of, 91.
..... cure for heaves in, 99, 108, 141.
..... fistula, 119.
..... ring bone, 157.
..... blinders for, objected to, 127.
..... dead, used as manure in France, 180.
..... docking, 1-0.
Horticulture, claims of, 9.
Hot-air furnace, figure and description of, 145.
Hot-beds, preparation of manure for, 18, 29.
..... to make, 49.
Hydrangea, culture of, 117.

I.

Indian buckwheat, cultivation of, 27.
Ingenious shell work, 1-0.
Inquiries, 21, 25, 41, 117, 126.
Insects, Kollar's treatise on, 130.
Irrigation, utility of, 119.

K.

Keep moving, 1-3.
Labor, nobility of, 159.
..... and labor-saving machines, 7, 142.
Lard, trying, 1-5.
Legislative aid to, agriculture, 113, 154.
Letter from H. M. Ward, 2.
..... Niagara, 53
..... A. Fergusson, 1-6, 134.
..... W. Parsons, 1-1.
..... W. Garbutt, 1-4.
Lettuce, culture of, 82.
Lightning-rods, to construct, 164.
Lime as manure, 152.
..... for wheat, 5, 180.
..... burning, perpetual kilns, 112.

INDEX TO VOLUME I.

Jeast, rose-flowering, 131.
 Joulon's Sulburhan Gardener, notice of, 26.
 Lucerne, experiments with, 51, 120.

M.

Magazine of Horticulture noticed, 9.
 Mahogany tree, 127.
 Mangel wurtzel and sugar beet, culture of, by W. Garbutt, 30, 31.
 successful experiment, 24.
 hints on sowing, &c., 120.
 Manures, remarks on, 150.
 great waste of, 179.
 best time to apply, 36.
 long, operation and effects of, 27, 117.
 must be applied right to be best, 130.
 and short, experiments on, 67.
 Man, who is the greatest, 125.
 Maple sugar, successfully made, 45.
 Markets in England, 93.
 Meteorological table for 1839, 26.
 Moon, influence of, 106, 159.
 Mulberry for silk, culture of, 74.

N.

New Genesee Farmer, prospectus of vol. 1, 1.
 address to patrons of, 1.
 testimony in favor of, 2, 24, 33, 121.
 recommended, 25.
 editorial assistance, 33.
 success of, 49.
 was honorably commenced, 52.
 editorial arrangements for, 56.
 Canada agency for, 21, 113, 177.
 cause of inaccuracies, 113.
 appeal to readers of, 130.
 prospectus of vol. 2, 161.
 Newspapers, 136.
 Notices to correspondents, 1.
 filing, 127.
 Niagara, a voice from, 151.
 Agents and Postmasters, 177.
 and readers, 17.

O.

Oats, Scotch, value of, 70.
 Oil from sunflower seeds, 97, 100.
 Ovens, brick, improvements in, 177.
 Oxen's eyes, cure for, 147.

P.

Peach trees, management of, 162.
 yellows in, of great consequence and little understood, 140.
 Peaches, large, 129.
 Pear, some varieties good only on quince stock, 34.
 varieties of described, 95, 156.
 trees, fire blight prevented in, 106.
 Peas, grass, recommended, 56.
 gold vine, noticed, 77.
 harvested by horse-rake, 125.
 preserving green, 127.
 Pie Plant, giant, 41.
 Plough, Locklin, figure and description of, 37.
 evice, improved, fig. and description, 105.
 Ploughing, frequent, injurious, 44.
 subsoil, experiment in, 99.
 Ploughing, fall, 161.
 match at Rochester, report on, 167.
 remarks on, 171.
 and ploughs, very important trial of, at Worcester, 156.
 Plum, Prince's Imperial Gage, great profits, 19.
 new varieties of, 69.
 varieties of, 140.
 trees, excrecences on, 33.
 Poetry: Nature, 76.
 The morning of Spring, 76.
 The flower boy, 91.
 The moss rose and the harp, 111.
 Rural melodies, 127.
 The last rose of summer, 132.
 Mount Hope Cemetery, 160.
 The farmer's Saturday night, 187.]
 Popular errors pointed out, 91.
 Pork, bad to eat too much, 93.
 preserved best in old unscalded pickle, 179.
 Porker, a thrifty one, 185.
 Potatoes, to cook, 9.
 experiments on, 27.
 recommended, 50.
 directions for planting early, 56.
 cultivation and harvesting, 66.
 harvesting, 189.
 in heaps need ventilation, 146.
 Rohan, successful culture of, 8, 29.
 profits of a peck of, 20.
 culture of in Wheatland, 37.
 remarks on price of, 66.
 Profession, choice of, 42.

Q.

Quince borer, to detect and remove, 71.

R.

Rainy days, to employ, 135, 163.
 Rats and mice, to destroy, 180.
 Razor straps easily put in order, 19.
 Razors, shaving, and improving cutting instruments, 78.
 Recipe, queer, 15.
 Red root, caution against, 21.

..... to extirpate, 92.
 Rennet liquor, to prepare, 163.
 Roller, value of, 180.
 Root crops, cheap way of raising, 72.
 culture of, by James Gowen, 174.
 slier, Gilson's, figure and description, 25.
 Roots, culture recommended, 11.
 barn cellars for, 29.
 culture of, advantages of, 59.
 preservation and use of, by John Barney, 79.
 Rotation of crops, principles of, 14.
 account of in Europe, 103.
 remarks on, 126.
 and fine farming, 185.
 Rules for housewives, interesting, 23.
 good neighborhood, 61.
 Rural taste, fine specimen of, 83.
 Ruta bagna, ridging for, 82.
 improved mode of harvesting, 83.
 hoeing, 97.
 to raise cheap, 121.
 enormous crop, 166, 169, 171.
 Rye, spring, recommended, 56.
 tall, 93.

S.

Schools, common, "the people's colleges," 184.
 Seeds, causes of not germinating, 11.
 sowing and causes of failure in, 62.
 bad; properly bad culture, experiments, 97, 121, 149.
 propagation by, important hints, 136.
 experiments in sowing, 89, 108.
 Seed store catalogue, notice of, 37.
 agencies and correspondence, 56.
 Shade trees in pastures, 135.
 Sheep, profits of, shown by experiment, 50.
 live long under snow, 77.
 good way to wash, 89.
 breeds and management, by A. Fergusson, 134.
 Signatures should not be fictitious, 53.
 Signs of the times, 90.
 Silk, publications on, 44.
 duty on, 45.
 importation of, 184.
 able address of M'Lean on, 46.
 goods, American, account of, 55.
 business, revival of, 105.
 in Rochester, 125.
 reeling, anecdotes and directions, 107.
 reel, Piedmontese, 188.
 worm eggs, to keep, 155.
 culture, remarks on profits and prospect, 18, 23
 now the time to begin, 43.
 importance of, 74.
 successful experiments in, 75.
 the A B C of, 86.
 interesting facts in, 142.
 Sleigh ride and upset, 25.
 Small comforts for women should not be neglected, 63.
 Smut in wheat, to prevent, 13.
 Snow, observations on, 26.
 weight of, 77.
 Soap, labor saving, 87.
 suds as manure, experiment, 146.
 Soiling, economical on small farms, 72.
 Speculation, 39.
 Steers, breaking, 102, 123, 163.
 Straw cutter, Gilson's, 25.
 Strawberries, varieties of, 140, 162.
 to plant, 162.
 Striped bug, easily scattered, 106.
 Sugar beets, cost of raising, 15.
 great crop of, 15.
 good for cows, 31.
 in Michigan, 73.
 injured by fresh manure, 83.
 value of, 83.
 Sugar from beet, premium on, 55.
 D. L. Childs' work on, 53.
 improvement in the manufacture of, 57.
 experiment, 77.
 manufactured in New England, process described, 84.
 extent of manufacture, 87.
 D. L. Childs' experiments detailed, 100.
 Sugars, foreign, 151.
 Sulphur showers caused by pollen, 109.
 Sunflower, uses of, 69.

T.

Tares or vetches, experiment on, 71.
 Tariff, remarks on, 94, 98.

Thrashing machine, Pitt's, engraving and description of, 165.
 Timber, best time for cutting, 59.
 Tomato, qualities of, 151.
 Tools should be painted, 151.
 Transplanting should be done well, 19, 143.
 Travelling agent, a dream, 61.
 Turnip fly, to prevent, 104.
 Turnips, description of varieties, with figures, 41.

V.

Vegetable diet, 147.
 Vegetables, decomposition of, 31.
 most nutritive compounds in, 36.
 great change in by a change of soil, 42.
 early, 93, 112.
 Victoria regalis, notice of, 77.

W.

Wages, high, and taxation, 182.
 Warming houses, 157.
 with hot air, 145.
 Wayne county, appeal to the farmers of, 131.
 agricultural society, 181
 Wax, mode of extracting from honey-comb, 21.
 Weeds, 118, 121.
 Weevils in graneries, to destroy, 23.
 Wells, best way to draw from, 19.
 bad water in prevented, 34.
 pumps for, recommended, 69.
 Wheat, description of improved varieties, 4.
 to prevent smut in, 67, 159.
 fields should be weeded, 89.
 early, 93.
 Tuscan, successful experiment, 98.
 rust in, 100.
 new varieties, 125.
 ploughing in, 131.
 market, prospects of, 135.
 new and productive variety, 141, 146.
 many headed, 167.
 crop, improvement of, remarks on, 3.
 in Ohio, extent of, 31.
 Spring, experiments on, 36.
 Italian and Siberian described, 68.
 culture, improvements in, 88.
 in Europe, 114.
 Whimeical calculation, 16.
 Who is independent, 39.
 Wild rice, 45.
 wanted, 132.
 obtained, 157.
 Winter evenings, to spend, 16.
 observations on, 45.
 of 1839-40, in England, 53.
 Wintering domestic animals, 3, 18, 19, 35, 38, 178, 183, 185.
 Wisconsin, and emigrants, 149.
 Wives--to make them love their homes--read it, husbands!--143.
 Wood, to split for stoves, 177.
 Woman, 159.
 Women milking, 77.
 Working man's bone, 187.

READER! just examine these two pages of Contents, and observe the number, variety, and importance of the subjects treated of in the volume, and consider the value of the practical information it contains: then remember that the whole is afforded for FIFTY CENTS!

ARCADE BUILDING, ROCHESTER.
CONTAINING THE

NEW GENESEE FARMER OFFICE, SEED STORE, POST OFFICE, &

The above engraving represents a front view of the Arcade Building, on Buffalo st., in the most central part of the city of Rochester. In the centre of building is a large open Hall leading to the SEED STORE, POST OFFICE, and ARCADE HOUSE; and stairways on each side lead to numerous Law and other offices and to the Printing Office of the "NEW GENESEE FARMER."

ACKNOWLEDGMENTS.

In completing the first volume of the New Genesee Farmer, the proprietors desire to offer their grateful acknowledgments to the numerous friends of Agriculture who have kindly assisted them in the enterprise. The extensive correspondence, and the talented editorial aid which we have received, has been the main cause of our flattering success, and of the satisfaction which the paper has given its readers. Our sincere thanks are also due to the many Post Masters and Agents who have volunteered their aid in obtaining subscribers, and rendered us essential service. The experience of the past year, has convinced us that the friends of improvement in the GENESEE COUNTRY and the GREAT WEST, are determined to sustain the *Genesee Farmer* in its native soil and at its economical price: and while we congratulate them on their successful re-establishment, we earnestly solicit them to continue and increase their praiseworthy efforts in order that it may be successfully sustained. Let the friends of Agriculture lend us prompt assistance and extend the circulation of the paper, so that its influence may be felt throughout the whole community; and let them unite with us to awaken such a spirit of improvement as will cause a new tide of prosperity to flow over this fair country—and all strive to elevate the profession of Agriculture to that rank which Heaven intended it should occupy, when He, who created man, selected the cultivation of the soil as the employment best adapted to his physical, intellectual, and moral nature.

THE NEW GENESEE FARMER AND GARDENER'S JOURNAL.

M. B. BATHAM,
E. F. MARSHALL, Proprietors. } VOL. 1. ROCHESTER, JANUARY, 1840. NO. 1. JOHN J. THOMAS,
M. B. BATHAM, Editors.

PROSPECTUS OF
THE NEW GENESEE FARMER,
AND GARDENER'S JOURNAL.
PUBLISHED IN CONNECTION WITH THE ROCHESTER SEED STORE
AND AGRICULTURAL REPOSITORY.

JOHN J. THOMAS & M. B. BATHAM, Editors,
M. B. BATHAM & E. F. MARSHALL, Proprietors.

The Genesee Farmer, which for nine years past, has been published in Rochester, to the great benefit of the whole Western Country, is now discontinued, and the labors of its publisher are transferred to the "Celebration" at Albany. Regretting the loss of their favorite Journal, many of the warmest friends of Agriculture in this section, have advised the establishment of a "New Genesee Farmer" in this place, and have pledged their influence and talents to its support. The city of Rochester is the Capital of the justly so-called "Genesee Country"; it is surrounded by an inexhaustible agricultural community, and a vast territory of invaluable richness and fertility, and in every respect, a most appropriate location for an Agricultural Periodical. The very extensive circulation of the late "Genesee Farmer," affords good evidence that such a paper is demanded in this section, and that it will be sustained by the general and enlightened community for whose benefit it is intended. Influenced by these considerations, we have concluded to issue a "New Genesee Farmer," which we shall aim to make not only the best, but the most useful, and the most extensive, circulation of an agricultural paper in the country. With the advantages we possess, and the talent at our service, we are confident this can be done; provide our friends, and the friends of improvement, some food for our work, and that, rouseworthy and successful zeal which many have heretofore manifested.

The grand aim and object of the New Genesee Farmer will be to promote the great and important arts of Agriculture and Horticulture, and the interests of all those engaged in them. To reasonable pains or expense will be spared in making the paper useful and interesting. It will readily be seen, that in order to afford so large a paper at so small a price, it is necessary that the subscription list be very large. The small sum which it costs, certainly places it within the reach of every farmer, and it is confidently believed, that, with a little effort on the part of public spirited individuals, nearly every farmer in the land may be induced to subscribe for it, and a new impulse be thus given to the march of agricultural improvement. One of the publishers and co-operators, is well known as proprietor of the Rochester Seed Store. His extensive correspondence and business connections in this country and Europe, together with his intimate knowledge of the objects, will qualify him for the present undertaking. The other publisher is an experienced Master Printer and Publisher, and the appearance of our sheet will soon prove to be well qualified to superintend the mechanical department of the business. The other gentleman, whose name we are at the present moment, is so well known to the public as writer on Agriculture and Horticulture, that naming him here is needless. He is a laborious and communicative man in the old Genesee Farmer, together with those of his other, David Thomas, whose aid we also expect, will contribute largely to the high reputation which the paper is destined to attain. In addition to the above, we have assurances of aid from many, if not most of those, who have friends distinguished themselves as writers on these subjects, and from several other gentlemen of science and talent, who have not heretofore contributed to this cause.

TERMS.—The "New Genesee Farmer" will be issued monthly, commencing 1st January, 1840, in double quarto form, 16 large pages, (same as the old Genesee Farmer) at the price of 30 cents per year, payable always in advance. Post Masters and Agents, sending money free of postage, will be allowed a commission as follows:

Eleven copies for	\$ 5 00
Twenty-four copies for	10 00
Fifty copies for	24 00

As an additional inducement, donations of rare and valuable seeds, lately obtained in Europe and elsewhere, will be given from the Rochester Seed Store, as opportunities may occur, to such persons as exert themselves in obtaining subscriptions, or writing communications. The Post Master General has decided that Post Masters have a right to remit money, free of postage, from subscribers to publishers of papers. All who wish to benefit that class of community on whose success all others must depend, are respectfully solicited to use their efforts to obtain subscribers.

All Letters and Communications must be addressed to BATHAM & MARSHALL, Rochester, N. Y.

To Patrons and Correspondents.

We are truly grateful for the interest which many of our friends have manifested in our undertaking, and for the prompt assistance they have rendered. Owing to the hindrance of the mails by the snow, several valuable communications, intended for this number, were not received in time. They shall appear in our next, and, in the mean time, we hope to hear from a number of other persons, whose pens have often benefited many of our readers.

Persons to whom this number is sent, who are not subscribers, and do not wish to become such, are requested to hand to some other person, who, upon examination, may wish to subscribe. Those who receive more than one copy, will please circulate the others to the best advantage. Agents, and others, sending in the names of subscribers, will please mention such as have got the first number, that we need not send it again.

An Explanation.
We intended to have made this paper exactly of the same size as the late Genesee Farmer, but not being able to obtain a press sufficiently large, we are compelled to make our sheet a mere tools only. To make up for this deficiency, we shall use a better quality of paper, and our type is entirely new and of fine sort; so that we think the New Genesee Farmer will have a more agreeable appearance than the old one, and contain as much valuable reading, and give as good satisfaction.

Editors, and others, will observe that this is not the Genesee Farmer, which was formerly published here by Luther Tucker. We do not wish to fall upon the reputation of that paper; but expect to stand upon our own merits alone, and hope that Editors, with whom we exchange, will be careful to give our title, and to address their papers to the New Genesee Farmer.
Editors of Newspapers, in favor of Agricultural improvement, are requested to publish an abstract of our Prospectus, and send us one paper, and we will send them ours for the year.

Engravings.
We shall illustrate our subjects with numerous engravings but have only time to prepare one for this number.

ADDRESS TO OUR PATRONS.

In commencing the publication of an agricultural journal, it is hardly necessary to urge the importance of the cultivation of the soil. It has not only been the means of constructing the great public works of the state, and of furnishing them with constant employment, but it is the basis of all other pursuits, which may justly be considered as its auxiliaries. It not only lies at the foundation of our state and national prosperity, but on it depends the very subsistence of all civilized nations, and is unknown only to the rudest conditions of savage life.

It is a matter of regret, that while commercial and political papers in our country may be multiplied perhaps by thousands, those devoted to the husbandry of four-fifths of the inhabitant, are limited to only a hundredth part of the number. The result of this neglect has been the necessity of importations from Europe of the necessaries of life, while we have had an immense and fertile territory before us, and due to a man in which many are involved, who have neglected the safe and profitable occupation of judicious farming, for the uncertain pursuit of commerce and speculation.

The great advance in art of culture in Europe within sixty years, furnishes a very instructive example of the improvement of which it is susceptible. In Great Britain, the produce of the soil has doubled, or increased to the enormous amount of three hundred and fifty millions of dollars annually. In Scotland, the present annual product exceeds that of the latter part of the last century by three times the amount. In the best farming countries in Europe, the average crop of wheat, according to authentic statements, is from thirty to forty bushels per acre; but, from thirty to fifty bushels; oats, upwards of fifty, and potatoes from three hundred to three hundred and fifty bushels. It is well known that our average crops in this country has been far inferior. But a rapid improvement is taking place in this respect, and a greater attention given to improvements in agriculture, as is evident from the increased number of periodicals devoted to the subject, which are doubtless destined to accelerate its progress.

That great improvements are yet to be made in the general practice of farming, is evident from the fact, that there are a few farmers who raise more than double the average amount of the general crop of the country. The example and practice of such farmers are well worth studying. The large crops of corn which some have raised, varying from eighty to a hundred bushels for many successive years, shows that much improvement is to be made in the general practice, and affords strong evidence of rapid improvements yet to be made in the culture of other crops. The vast increase in value which has been given to corn, and neglected farms in this state, which were worth but a few dollars an acre, but now pay, clear of all expenses, an interest on one or two hundred dollars an acre, is also well worthy of attention.

The increased value, which may be given to all our land, by the proper use of lime and ash, by a judicious system of rotation; by the use of plaster, and green crops as manure; by effecting underdrainage, by deepening soils; and by the cultivation of root crops as food for domestic animals, thus increasing the amount of manure manufactured on a given quantity of land; all need farther investigation by farm is generally, and when fully ascertained, need a more general dissemination.

To the spread of information on these subjects, agricultural papers are properly devoted. We know the prejudice which exists with many, relative to *book-farming*; and this is not wholly unfounded. Those who undertake cultivation on a large scale, from written directions merely, must expect failure. Experience, and personal observation, should be combined with the knowledge derived from others. Experience must form the basis; information derived from reading, the superstructure. The indiscriminate adoption of hints from books would be extremely improper; the judgment must determine the fitness to the proposed object. Directions are frequently given, and experiments detailed, which are only applicable to particular climates or soils, and fail in others. An operation,

for instance, may succeed only on a sandy soil, and fail entirely on a clayey one. Hence, from such failures, an aversion is caused to all written suggestions. When every requisite is not distinctly pointed out, the experience and judgment of the farmer must direct.—An important part of an operation may be omitted—such as intelligent farmers called against root crops because the necessary precautions were not taken in feeding;—Another instance in point is the following:—A farmer had read much of the benefit derived from clover, he accordingly covered his land in large heaps, which were imperfectly spread, leaving spots of two or three inches in thickness, which were carelessly mixed with the soil. The crop of corn, in consequence, was greatly injured—a convincing proof of the folly of book-farming. But another covered evenly his ground to a thickness of four inches with clover, which he mixed thoroughly with the soil by many successive ploughings, and the soil was very decidedly improved. The latter experiment was performed on clayey land. Such facts show the necessity of a thorough knowledge of the subject.

But some shut their eyes entirely to every thing written. A farmer who totally rejects book-farming, will gladly listen to a statement from his neighbor by which he may raise a bushel more on an acre with the same labor, and he is benefited perhaps hundreds of dollars by it; but publish this statement in an agricultural paper so that its benefits may reach thousands, and it immediately becomes an idle tale entirely unworthy of notice!

A single hint obtained, is sometimes of great practical value. A neighbor had several acres of pease which needed immediate harvesting, and he offered a dollar an acre to get them mowed, without success. He however remembered to have read that pease might be readily gathered with a horse rake without mowing. The rake was accordingly put in operation, and the pease were harvested at a very trifling expense. "That single fact alone," he added, "saved me much more than the price of the paper." Similar instances very frequently occur.

But we hope to be useful even where the facts we exhibit may not be entirely new. Recalling to the mind what is already known, is often more important than new information. It is believed that by recurring to our hints for each month, which we hope to continue through the year, not only on the subject of farming, but on gardening also, our readers may be frequently reminded of important operations, the success of which depends in a great degree on their reasonable performance.

Testimony in favor of the New Genesee Farmer.

We have asserted that this paper was commenced by the advice of the friends of Agriculture in this region. We wish therefore to say a few words to substantiate that assertion.

As soon as we understood that Mr. Tucker had determined to discontinue the Genesee Farmer here, and remove to Albany, we tried to dissuade him from it, but he said he thought it was for his interest to go there, and that therefore he would not consent to remain here. We were anxious to see a paper continued here, but having enough of other business we did not wish to engage in the enterprise ourselves, provided any other suitable persons would do it. Being advised and urged by our friends, however, we at length determined to go on, provided the friends of the cause were in favor of the project, and would engage to assist us. We then wrote to a number of the most influential persons, whose opinions we thought the most deserving of consideration, asking their opinions and advice on the subject, and whether we might rely on them. Their answers were so decidedly and unanimously in favor of

establishing a New Genesee Farmer, that we determined at once to proceed, with full confidence of success.

We should be pleased, had we permission, to publish several of the letters received on this subject, but will content ourselves with the following, from Mr. H. M. Ward, who is well known as one of the warmest friends of improvement in this vicinity. Those who with us had the pleasure of listening to his able and pertinent address delivered before the Monroe County Agricultural Society, several years since, will know how to appreciate any thing from his pen.

MR. H. M. WARD'S LETTER.

To the Editors of the New Genesee Farmer.

Gentlemen,—I am highly gratified at receiving your proposals for publishing a New Genesee Farmer; sharing as I do in the very general regret at the discontinuance of the former paper, I rejoice that its place is to be supplied by one published here, under auspices ensuring its permanency, and promising so much for its future usefulness; and that we are not to be deprived of the advantage of a paper devoted to the great interests of agriculture. It was well said in the first number of the Genesee Farmer, printed nine years since, that "no part of the world is more richly blessed with soil and climate for a great and flourishing agricultural interest, than the Western part of the State of New York—that part called 'Old Genesee.'" And every year that has passed since the above paragraph was written, has confirmed its truth, and I may add that every number of that valuable paper has helped forward that interest. And I rejoice that it was from no want of a just appreciation of the value of such a publication, on the part of Agriculturists in "Old Genesee," that its removal or discontinuance was thought necessary, by the former publisher.

When the Genesee Farmer was first published in 1831, it was considered by the friends of agriculture, as a very doubtful, if not rash experiment. The success which has attended it, has removed those doubts, and proved that a well conducted paper (and such I am confident the New Genesee Farmer will be) devoted to the interests of Agriculture, can, and will find support from those devoted to that pursuit. And why should it not be so? What other great interest in our country is without its appropriate organ of communication with the public—its Journal to record its progress and improvement—its medium of correspondence between its scattered members? One who has paid but little, or no attention to the progress of agriculture in "Old Genesee" for the last ten years, may not be aware how much that progress has been accelerated by the publication in the midst of us, of a paper devoted to its interest—but to one engaged in that pursuit, who has watched with interest its rapid, and more rapid improvement—to you, Mr. Senior Editor, whose pen contributed so much to the interest and usefulness of the old Genesee Farmer, and is pledged to the service of the "New"—that accelerated progress, and its connection with the publication alluded to, are no secret; and by all such the appearance of your paper will be welcomed. As observed above, the first establishment of the Genesee Farmer, was an experiment of doubtful expediency, but its re-establishment cannot be considered as such, for those who have become interested in the former paper—who have been accustomed to contribute to its pages, to rejoice in its success and in the benefits flowing from its publication to the Agricultural interest of the country, will not be slack in affording to its new enterprise their countenance and support.

For the success of your undertaking, you have, Gentlemen, my best wishes, and shall have what I think aid may be in my power from time to time to afford.

Rochester, Dec. 28th, 1832.

H. M. W.

PROPOSED AGRICULTURAL MUSEUM, AT ROCHESTER.

The Agricultural Museums of Scotland, in connexion with their Seed Establishments, have contributed greatly to those wonderful agricultural improvements, which have been effected in that country, during the past ten years. We lately had the pleasure of visiting the celebrated Museums of the Messrs. LAWSONS, at Edinburgh, and the Messrs. DUNCANSONS, at Stirling. The immense number and beauty of the articles there exhibited, are truly surprising, and cannot help but excite a spirit of improvement in the mind of every farmer, who views them.

There can be no doubt, but that such establishments would tend greatly to the advancement of agriculture, in this country, as well as in Scotland. And it is surprising to us, that no systematic establishment of the kind has been attempted, as yet, in this country. We have thought that an Agricultural Museum, in connexion with the Rochester Seed Store, and The New Genesee Farmer, would add greatly to our means of usefulness, and excite new interest in the cause of improvement. And, if our friends will aid us, we will this year commence forming a collection, which, if all goes well, may hereafter be called the "Genesee Agricultural Museum," and be worthy of that honorable title. It will require much time and labor to bring it to any degree of perfection; and we must of necessity depend greatly on the assistance of others. If success attend our efforts, this year, we intend next season to enlarge our establishment, and fit up a separate room for the Museum. In the mean time, we hope the friends of the cause will aid us, by sending in to the Rochester Seed Store, any articles, which they can furnish, that may be thought interesting, particularly such as the following, viz: Pure specimens of all the different varieties of Wheat, Oats, Barley, and Rye,—clean samples of grain, say about one pint each; and a handful of each kind, say about one hundred heads, in the straw, selected of the average growth, cut close to the ground, and tied up in a neat bundle,—each specimen to be labelled with the name and general character of the variety.

Samples of all kinds of Indian Corn, in the ear and on the stalk, with particular remarks as to earliness, &c.

Samples of Buck wheat, Broom Corn, Millet, Mustard, &c. &c., in such forms as will best exhibit the character, growth, &c.

Specimens of all kinds of Grass and Clover. The should be cut close to the ground, or pulled up by the roots, about the time they are in flower, and dried like botanical specimens, by pressing between paper: a few old newspapers will answer for this purpose, with a piece of board and heavy stone on the top, for a press.

Specimens of noxious or troublesome Weeds, with some account of their habits, and best mode of extirpation: (these should be prepared in the same manner as grass and clover.)

Specimens of Roots and Vegetables, especially such kinds as are new, or uncommon, or of extraordinary growth, &c.

Specimens of all kinds of Fruit, with names: show-case for fruit will be provided early in summer.

Specimens of domestic Silk, or any thing pertaining to the silk business. Also, Beet Sugar, and any other articles of home production and industry.

Specimens or Models of approved Implements, Machines, &c.

Specimens of extraordinary Soil, Marl, Plaster, Lime, &c.

Books, Pamphlets, and Papers, relating to Agriculture and Horticulture.

These are a few of the most important articles, necessary to the formation of an Agricultural Museum. We hope all of our friends, who are in favor of the project, will endeavor to furnish some of the above. The names of the contributors will be recorded, and a report will be published occasionally in The New Genesee Farmer.

SEASONABLE HINTS.

Although winter has set in, it is not yet too late to provide shelter for domestic animals, where it has been hitherto omitted. Sheep are usually more exposed than cattle; but the fact that so many die in wintering, shows that protection for them is of the first importance. The improved quality of the wool and value of the animal, would more than compensate for all the labor required. There would also be a saving of food, as all domestic animals eat less when sheltered from the cold. A very necessary precaution is to separate the strong from the weak, the latter to receive additional care; and where the flock is large, it should be thus divided into several flocks.

Very cheap temporary shelters for any kind of farm stock where straw is abundant, may be easily made as follows:—Build a pen of large poles or rails, to the desired height, so that instead of being a single wall of rails on each side, there may be two walls, enclosing a space about a foot wide; fill this space with straw, treading it down compactly. Then lay rails across the top, about one foot apart, and cover the e thickly with straw for a roof, and the building is finished. It thus forms a warm and effectual shelter. We have seen a good stable for two horses made in this way by one hand in a few hours, while the cost of material was almost nothing. Old or wet straw is preferable to good, as cattle would not be induced to eat it, though, if well packed, they cannot in any case.

Hay is often wasted to a large amount by the want of racks for feeding. Where thrown upon the ground, half of it is frequently trodden under foot, in wet or muddy weather, and destroyed. Time would therefore be well employed, during the leisure of winter, in constructing suitable racks.

Hay is also wasted by feeding in too large quantities at a time, by which the animal's breath becomes condensed on it in large quantities, and it is rendered unpalatable, and is rejected.

Hay, straw, corn-stalks, and all other kinds of fodder, supply animals with more nutriment when cut or chopped fine. Stage-proprietors, who feed a great number of horses, have found a saving of one-third by chopping hay before it is fed to them. Mixing cut straw, hay, and meal, is an economical practice; the quantity of each ingredient may be varied according to circumstances. Horses kept at work, should have a greater proportion of hay and meal, than those standing idle.

As it is not practicable, however, for every farmer to cut his straw, a saving of hay may be made by feeding it uncut, and proper contrivances for this purpose become desirable. One of the most simple and effectual is made of four strong rails so as to form a square or parallelogram, supported at a height of about four feet upon four strong corner posts, to which the rails are securely pinned. Stakes, resting with one end on the ground, and the other upon these rails, inclining outwards, complete the construction. The straw is stacked in this pen or large rack, from which the cattle eat it; its weight causing it to fall and rest upon the stakes as it is consumed.

When cattle do not freely eat straw, they may be induced to do so by sprinkling it with brine, as it is fed to them.

Watering cattle in winter is too frequently neglected. They are found to drink several times a day, when water is before them, which they would not do, if it were not requisite for their health and comfort. All animals may be more cheaply kept, and in better condition, if their comfort is strictly attended to and all their wants supplied.

SMOKING HAMS.—We are assured by an intelligent farmer, that hams are very effectually preserved from the attacks of the fly, while their quality is not at all

injured, by throwing red pepper upon the fire in the smoke house, during the latter part of the operation.

It is also stated on good authority, that the dampness, so frequently caused by brick and stone smoke-houses, may be entirely avoided, by making a hole three or four inches in diameter, at the roof, which will cause an upward current, and by which the moisture will be prevented from condensing upon the meat.

FRUIT TREES.—The importance of preserving fruit trees from mice, may render the frequent repetition of a single remedy for preventing this evil useful to some of our readers. Except trees and in thick grass, which should never be permitted, these little depredators attack the bark of trees only when they can do it under snow. Hence by treading the snow compactly round the trees, the mice are shut out from them, and a few repetitions at intervals, during winter, will effectually protect them. We knew a cultivator, who had just transplanted a large orchard of fine young peach trees, costing him nearly fifty cents apiece, but who lost nearly the whole of them by mice, while his neighbor, at an expense of less than a cent a tree, saved the whole of his. Trees planted in cultivated ground, are much less liable to injury, than those planted in grass ground. Wherever it is inconvenient to keep orchards of small trees in a constant state of cultivation, inverting the sod in autumn with a spade, to a distance of two or three feet round each tree, is a great protection, as it removes the grass, and elevates the surface so that the snow does not lie so deep around them; at the same time the growth of the tree is promoted.

WINTER BUTTER.—Many attempts have been made to facilitate the process of butter making in winter, as by heating the milk, warming the cream, &c. to shorten the tedious process of churning, which at this season of the year sometimes requires two or three hours. But we have invariably found these methods of shortening the operation to lessen the quantity or injure the quality of the butter. The only course appears to be to persevere patiently in the old way, as a long churning often affords the best and greatest quantity. As Euclid said to Ptolemy, when asked if he could not acquire mathematical knowledge by some shorter way than tedious study, "There is no royal road to geometry;" so it may justly be said, *there is no royal road to butter making.*

The quality and quantity may however be greatly improved by giving proper food. Pumpkins, carrots, and mangel wurtzel, fed regularly and in sufficient quantity to cows, will double the usual quantity of milk and butter, and all much to its appearance and flavor. This, with the improved condition of the animal, and the saving of hay, renders the cultivation of these kinds of food for cattle of very great importance.

We have discovered a method by which the operation of churning, in autumn and winter, may sometimes be much shortened, when it does not *gather readily.* The minute granules of butter often appear in the cream, but do not for a long time become consolidated. A small lump of butter, thrown at this period into the churn, forms a nucleus, around which it collects immediately. This simple expedient, has in the course of a few months saved many tedious hours of labor.

Agriculture as a profession, strengthens the mind and contributes to the health and energy of the human constitution; and when attended to as a science, it is a boundless source of rational amusement, wealth and happiness.

Corruption of Moral's the mass of Cultivators, is a phenomenon which no age or nation has furnished an example.—LITHOR.

Improvement of the Wheat Crop.

Our aim is the improvement of Agriculture; and the GENESSEE country has a just claim to the first and greatest share of our attention. We shall endeavor to bestow our efforts upon the different crops of this season somewhat in proportion to their relative importance and susceptibility of improvement. On the score of importance all will agree, that the *Wheat Crop* ranks far the highest. The very name "*Genesee*" is almost universally associated with *Wheat and Flour.* Our *fame and our flour,* have together spread to almost all parts of the world; and wherever our name is mentioned our praise is heard. Indeed most people at a distance have got a much higher opinion of our agriculture than we really deserve, and hence, on coming among us, they are usually disappointed. They expect at least to find that we excel, if not excel, all other countries in the culture of *Wheat.* And some of our own farmers, honest sons of *old Genesee,* really imagine that they have reached perfection in the art of wheat-growing, and nothing farther can be taught them on that subject, while at the same time their fine lands, which now produce only twenty or twenty-five bushels to the acre, might, with proper management, and little more labor, be made to produce full one third or one half more than they now do.

We left England about twelve years ago, and during the past summer re-visited that country and Scotland, so that from personal observation as well as from reading, we are somewhat prepared to speak of the improvements which have been effected in those countries. Twelve years ago the average crop of wheat there, was about the same as it is now in this country. Twenty bushels per acre was considered a good fair crop, and thirty, quite a heavy one; but now, in the best farming districts of England and Scotland, forty to fifty bushels is considered no more than a fair crop, and not unfrequently sixty to seventy bushels per acre is produced.

Now all must admit that what has been done in one country, can, by similar means, and under similar circumstances, be done in another. We are aware that some will say that these large crops are the results of an extraordinary system of culture, which owing to the high price of labor cannot be adopted in this country. It is true the lands in England and Scotland are mostly far better cultivated than in this country, and it would be good economy if our farmers would imitate them more closely in this respect; but still it is not so much owing to the greater amount of labor bestowed on their land, that they excel us, but to the better application of that labor. We do not expect our readers will thank us for the compliment, but truth demands the assertion, that the farmers of England and Scotland understand the business of growing wheat better than the farmers of "*Genee.*" They have studied the nature of the materials with which they have to do. They understand the capabilities and deficiencies of their soil, and the means of its improvement; the proper rotation of crops; the use of manure, lime, ashes, marl, &c.; also, the different kinds and qualities of wheat, and the way to obtain improved varieties. Much has been done of late by way of introducing new and improved varieties of wheat into England, which has contributed greatly to the increase of the wheat crop. Col. Le Courcier, of the Island of Jersey, has for several years given this subject his particular attention. His experiments and essays on wheat are highly interesting and valuable; and he has introduced or originated several superior new varieties. At the Manchester Agricultural Show in October, we saw exhibited about thirty samples of the best kinds of wheat, both in the ear and clean. At the Highland Agricultural Society's Museum at Edinburgh, and at the Agricultural Museum of the Messrs. Drummond at Stirling, we were shown an

Immense number of distinct species, and varieties of wheat, some of which were very beautiful. The catalogue of the former is a brilliant enumeration more than eighty distinct kinds of this grain.

Owing to the difference of climate, many kinds of wheat which are found highly valuable in England are not suitable for this country; still, we are convinced that much may be done by way of introducing more valuable kinds than those in general use, and by improving those kinds already in cultivation in this country. We intend to import all the most improved kinds from Europe, with a view of testing their adaptability to the climate ourselves, and comparing them with our common varieties. We earnestly request all of our friends who can conveniently do so, to make experiments and observations on the culture of wheat, and send us the results for publication. We are confident that there is much still to be learned on this subject, and that this all-important crop, the staff of life, and of our agriculture, may be greatly improved.

We intend to recur to this subject, but shall conclude for the present with the following essay, which is not only valuable for the information which it contains, but for the instruction it gives respecting the manner of conducting such experiments.

From the Journal of the English Agricultural Society. On pure and improved varieties of wheat lately introduced into England. An Essay, to which he Prince of Two Sicilies was awarded in July, 1838.—By Colonel Le Cou'teur.

WHITE DOWNY. 1st. The mode of preparing the sorts of wheat described.—One of the best varieties of wheat in general cultivation, from which I have raised large crops, is the "White Downy," or "Henry," the "Vesuvius" of the French.

This excellent variety is believed to be the same that is so well described by Boys, in his "General View of the Agriculture of Kent," as the "Hoary Wheat," or "Velvet-headed," and by him to have been much prized by the millers, but then entirely lost.

2nd. Its culture, viz., preparation and quantity of the seed; time and method of sowing; relation both as to preceding and following crops, and as to varieties of soil.—The seed was carefully washed in several waters, till the water appeared clear on straining the wheat with it: this is intended to draw off any smut, rust, or noxious particles of the fungus, which might be adhering to the grain, or to the straw, and thus made sufficient to do a great deal of mischief. In this it was steeped overnight, or about twelve hours, then well washed in several lines. This process, it is thought, is the best mode of destroying the seeds of a large number of noxious insects.

Time and method of sowing.—The seed of this preparation was sown in drills, about 3 inches deep, in 1837, 7 inches apart, with a view to the use of a double-drilling machine, at the rate of 2 bushels to the bushel, or 10 to the acre. The wheat was sown in drills, and finished in the month of May, when rains fell in plenty.

Relation both as to preceding and following crops.—The land in which the above wheat was sown had been well dressed with 9 ton of dung to the acre, the previous year, for potatoes, which were well manured and once harrowed to remove any weeds which the horse-hoe might have left. The land remained very clean, and after the potatoes were dug, and well cleared from the soil by two ploughings, the quarters of long-weed (or help) ashes were spread on the 13th of September to the acre, at a cost of 2l. 5s. per acre, and a month afterwards, ploughed in, about 5 inches in depth, with a view to nourish and warm the young shoots of the wheat, sown 3 inches deep. The seed has a peculiar tendency to cause the wheat to grow, and render it plump, white, thick-skinned, and nutritious. They have the additional quality of greatly augmenting the produce of the succeeding crop of clover. The soil on which the trial was made, being derived from argillaceous schists, is light and rich, and entire, however, the present soil, to compare it to the effect of which lime has been applied.

3rd. Hardiness and power to withstand severe winters.—This wheat will withstand the most severe weather. The season 1837 to 1838 was a very trying one, both as to violence and severity of cold, the thermometer having fallen to 18° below freezing; but the crops of this wheat raised by my neighbours were perfectly insensible to it, and of great produce.

4th. Early maturity and time of severance of crop.

—This wheat is not so early for its early maturity, though it exceeds a number of early varieties. On this account it was reaped about the 16th of August.

5th. Quantity and quality of produce, and relation to diseases.—The quantity was very good, and from that of the other persons I have mentioned on the subject, the most abundant was not subject to disease; and, by weighing on the spot, and in a cool place for seed, the total weight of the grain was found to be 100 bushels, and in straw, as above, the grain is more apt to grow than the common varieties. It is not so early as the "White Downy," and when picked off, and dried in a cool place, it has never been found with smut, or rust, or other diseases, even when over-cropped, and well exposed to heavy gales without being dried or bleached. In a very bad year, as in which it was raised in the Island of Man, it is said to have withstood the worst weather of the year. Its height is found to be 5 feet 6 inches to 6 feet 6 inches.

6th. Amount of produce in grain, chaff, and straw, and the relative quantities of flour and offal.—This preparation of seed is superior to all others, of a very fine sort, and weighed 92 lbs. the imperial bushel. The straw was burned, and the weight of it produced was 157 lbs., and that of the chaff 315 lbs. to the acre.

Quantity of flour and offal.—The quantity of flour obtained from an acre was 2462 lbs. of the first, 139 lbs. of pollard, and 116 lbs. of bran.

The bread of a very fine quality, white, and soft, of a moderate nature, 18 lbs. of this flour makes 25 lbs. of bread. With a view to further the design of the Agricultural Committee, the mode of making this bread is said, which may enable other persons to make a comparative experiment, in the same quantity of flour from their own wheat.

The flour was placed to rise, or to sponge, overnight, with a pint of yeast, and 2 quarts of water. A portion of the next morning, 4 quarts of the yeast were added, and it mixed with 2 quarts of water, which was well worked up, and drawn up (just water) to expose it to the sun, in a room, in order to render it light, which was probably done, as it was with the seed, but which is not necessary, and tends to render it more of a heavy nature. The dough is left in a tub, for 24 hours, or 2 or 3 hours, and is usually kneaded 2 hours, or of less, according to the size of the loaf. It is worked when cold the next morning.

It is to be observed, that the flour has only yielded on the first trial, and the bread being made to rise overnight, 2 quarts of water; whereas other sorts have yielded as much as 3 quarts and 1 pint, or a quart more.

Table with 4 columns: Crop, £ s. d., £ s. d. Rows include 45 bushels of seed at 8s. per bushel, 34 cwt of straw at 7s., 8 cwt of chaff at 1s. per cwt, and various charges for cartage, carriage, and profit.

Table with 4 columns: Crop, £ s. d., £ s. d. Rows include 45 bushels of seed at 8s. per bushel, 34 cwt of straw at 7s., 8 cwt of chaff at 1s. per cwt, and various charges for cartage, carriage, and profit.

Table with 4 columns: Crop, £ s. d., £ s. d. Rows include 45 bushels of seed at 8s. per bushel, 34 cwt of straw at 7s., 8 cwt of chaff at 1s. per cwt, and various charges for cartage, carriage, and profit.

Table with 4 columns: Crop, £ s. d., £ s. d. Rows include 45 bushels of seed at 8s. per bushel, 34 cwt of straw at 7s., 8 cwt of chaff at 1s. per cwt, and various charges for cartage, carriage, and profit.

Table with 4 columns: Crop, £ s. d., £ s. d. Rows include 45 bushels of seed at 8s. per bushel, 34 cwt of straw at 7s., 8 cwt of chaff at 1s. per cwt, and various charges for cartage, carriage, and profit.

1st. The mode of preparing the sorts of wheat described.—The seed of this wheat, having been in seed for some years, was very much improved from the Duke of Devonshire's seed, from the "High Mead." It is, however, very superior to the seed of some other parts of Surrey, the "Common," in other parts "Peg-bush," in Berkshire, "Tuning" in Essex, "Hardshead," in some counties, "Old Suffolk" in Scotland, "Hunter's White," and assuming several other names.

2nd. Culture, viz., preparation and quantity of the seed; time and method of sowing, both as to preceding and following crops, and as to varieties of crop.—The seed was prepared in the same manner as the last described; it was sown on the same day on a common piece of land of the same nature as the last described for the purpose of comparison, therefore prepared in the same manner.

3rd. Hardiness and power to withstand severe winters.—This wheat is not quite so hardy as the "Hoary," it is nevertheless considered sufficiently so to succeed throughout the kingdom, excepting the north parts of Scotland. In such soils it is very amazingly, and produces a long straw, though the Hoary, nor is it so liable to sprout in a moist climate from being smooth chaff; in very severe, moist, and stormy weather, it will be found sooner than the Hoary.

4th. Early maturity and time of severance of crops.—It ripens a week earlier at least than the Hoary, and should be reaped while the grain can be marked by passing from the thumb-nail, as it is rather liable to shed if over-ripe, and a disadvantage which the Hoary is not subject to, in a moist climate, or in a rainy season.

5th. Tendency to degenerate and liabilities to disease.—The experience of five years has not found this wheat to degenerate. A simple raised this year from seed produced as above sown, was quite pure and unmixed; it may be said, as only 93 cwt of foreign growth were picked from one hundred sheaves which were carefully examined in order to free the sort from any of stray kinds which might accidentally have got intermixed with it. This is a practice which I now constantly follow with the wheat set apart for seed for the ensuing year.

In a dry season this wheat will afford a beautiful, clean, white straw, fit for basket-making, or any purpose of thatching; it is firm and tenacious. In wet seasons it is rather a subject to rust, which under such circumstances remains a short tail what sufficiency.

It is a fact worthy of notice that, in 1837, a field of this wheat, which had been sown with seed carefully washed and steeped in a solution of arsenic, had not a single smutted ear; but on one headland, for which there was no salient seed, a small portion was fetched from the barn, and sown dry; though appearing a short tail, it was infested with smut throughout; this was of course carefully picked out by hand before it was sown, and sown.

6th. Amount of produce in grain, chaff, and straw, and the relative quantities of flour and offal.—The crop was 417 imperial bushels of 63 lbs.; of chaff 115 lbs., and of straw, as described, 3661 lbs. to the acre. The quantity of flour obtained from an acre was 2462 lbs., of bran 139 lbs., and of pollard 116 lbs.

The bread from this flour is of a dry light nature, very white, and good, but inferior to some from which being quite what is termed dry bread at the end of 48 hours, it is, however, of excellent yield, and according to the millers, exceedingly fine and smooth in the working. It is a valuable wheat; 18 lbs. of the flour, treated as the former variety, yielded the following morning 3 quarts and 1 pint of warm water, and produced 253 lbs. of bread, weighed when quite cold.

Table with 4 columns: Crop, £ s. d., £ s. d. Rows include 45 bushels of seed at 8s. per bushel, 34 cwt of straw at 7s., 8 cwt of chaff at 1s. per cwt, and various charges for cartage, carriage, and profit.

Table with 4 columns: Crop, £ s. d., £ s. d. Rows include 45 bushels of seed at 8s. per bushel, 34 cwt of straw at 7s., 8 cwt of chaff at 1s. per cwt, and various charges for cartage, carriage, and profit.

Table with 4 columns: Crop, £ s. d., £ s. d. Rows include 45 bushels of seed at 8s. per bushel, 34 cwt of straw at 7s., 8 cwt of chaff at 1s. per cwt, and various charges for cartage, carriage, and profit.

Table with 4 columns: Crop, £ s. d., £ s. d. Rows include 45 bushels of seed at 8s. per bushel, 34 cwt of straw at 7s., 8 cwt of chaff at 1s. per cwt, and various charges for cartage, carriage, and profit.

1st. The mode of preparing it.—From Mr. Whittington's trial, it is a very fine specimen. The grain is heavy, full, and plump, rather of a whitish-red cast, and a little thick-skinned.

2nd. Culture, viz., preparation and quantity of the seed; time and method of sowing, relation both as to preceding and following crops, and as to varieties of soil.—The seed was washed, soaked, dried, and limed, as is used on this farm; then sown in drills 7 inches apart, about 2 bushels to the acre, on the 5th of January, 1838. When the seed is large, it is considered prudent to add half a bushel or more to the acre.

mixture of manures was with a view to afford the wheat a different food from any it might have received, all of them having a tendency to enase the corn to grain, and rather check the exuberant growth of straw. Owing to the cold and frosty season which followed, the wheat was 19 days in coming up; it was hoed in the middle of April, and again in May, which left the land very clean, and the crop contained to look beautiful throughout the season.

It is worthy of remark, that a piece of the wheat was laid along the centre of the field, over which a pipe of liquid manure had been spread from a watering-pot the preceding season on potatoes, just as they were appearing above ground. The crop of potatoes not having absorbed the whole of the nutritive properties of the liquid, the wheat grew tall, ears long, darker, and so abundant in straw, that it afforded less grain, and that too of an inferior quality to the corresponding strips on either side of it. The straw was 7 1/2 long in many places, and fell 6 feet over the whole field, which covers so of a solid layer of manure and schistus on a red clay bottom.

3rd. *Hardhood and power to withstand severe winters.*—I consider this to be a very heavy wheat, affording much chaff and straw, very fit for being once down by scap in the spring, when sown early in the fall.

4th. *Early maturity and sercance of crop.*—The "Whitington" is not a late wheat, ripening 7 or 10 days later than the Jersey Danzie, before described, though it was in bloom on the same day, on the 2nd of July. It was chopped on the 21st of August.

5th. *Tendency to degenerate, and liability to disease.*—From the purity of the seed, and the uniform appearance of the crop, it does not appear likely to degenerate, nor does it seem more liable to disease than other wheats, but its recent introduction prevents a conclusive opinion being off red on this head. The straw is brittle and many ears break off.

N. B. From the cultivation of another year (1870), I am inclined to think this to be one of the most valuable wheats for poor land; it has not degenerated in the smallest degree.

6th. *Amount of produce in grain, chaff, and straw, and the relative quantities of flour and offal.*—The produce in grain was 33 bushels the acre, a very good sample weighing about 61 lbs. the bushel; the chaff, 2-3 lbs.; and the straw 77-86 lbs. per acre. Here was an amazing produce in straw, which made amends for the deficiency in grain; it is the most productive variety I have met with but one for the straw yield. The straw is so long that it is unfit for the ordinary purposes of thatching; a short, tenacious, firm straw being generally preferred. The quantity of fine flour obtained from an acre was 1154 lbs., of bran 477 lbs., and 17 lbs. of pollard. The bread from this flour is rather dark, but very well flavoured, and keeps moist some days; 27 lbs. of this flour made into bread, in the mode formerly described, in the same relative proportions of yeast, salt, and water, afforded, when cold, 35 1/2 lbs. of excellent bread.

Crop.	£.	s.	d.

BELLE-VUE TALAVERA.

1st. *The mode of procuring it.*—Discovered in my work on Wheat as having been raised from a single grain. This variety is invaluable, where it is adapted to the soil and climate.

2nd. *Culture: viz., preparation and quantity of the seed, time and method of sowing, relation both as to preceding and following crops, and as to varieties of soil.*—The seed was prepared precisely as before described. The cultivation of the two fields done for this wheat and the Whitington had been similar throughout the course, with the view to ascertain the result on the crop of wheat. This was sown on the 3rd of February, 1858, at the rate of nearly 3 bushels to the acre in drills, on land dressed in the same manner as the contiguous field had been for the Whitington; the land in both may be said to be alike, the best description of light, rich, loamy soil. The seed being large, a greater quantity of it was allowed than usual. It is to be noticed that in another field the seed was put in as late as the 21st February, and that it ripened equally well and early.

3rd. *Hardhood and power to withstand severe winters.*—This wheatless or delicate kind of wheat, and is as easy sown, but it is so low and more valuable as a spring crop, without doubt it may be sown later than the first week in February, in all the fertile parts of England, with a view to the production of a good average crop from this sowing, particularly with a century of clover, and a few of the best manures. A circular of the same kind was sent on the 14th of September, 1857, to the same effect, and by such letters to the Editor, and of the 10th of October I do not get any other words to the contrary. The wheat is a very heavy crop, and the straw is of a good quality. It is well adapted for being once down by scap in the spring, when sown early in the fall.

4th. *Early maturity and sercance of crop.*—The wheat ripened in the same manner as the Jersey Danzie, it was in bloom on the 2nd of July, and was chopped on the 21st of August, a week or so earlier than the Whitington, which was sown early in the fall.

5th. *Tendency to degenerate, and liability to disease.*—There is not much to be said here, as the wheat is so young, and the experience of the crop is so short, as not to have been sown in any other field, but it is not likely to degenerate, nor does it seem more liable to disease than other wheats, but its recent introduction prevents a conclusive opinion being off red on this head. The straw is brittle and many ears break off.

6th. *Amount of produce in grain, chaff, and straw, and the relative quantities of flour and offal.*—The amount of produce in grain was 72 Imperial bushels to the acre; the grain was large, that it will be the same; the sample was found to be a bushel of it, which will be produced at the Oxford Mill, and will show—uniform, clear, and finished. Hence the weight in grain at 61 lbs. the bushel, was 1172 lbs., the weight of chaff 282 lbs., and of straw 568 lbs. The quantity of flour obtained was 2754 lbs., the quantity of pollard 38 lbs., and of bran or end 755 lbs. The bread made from this flour is most probably the best that I have met with; it is light, very white, and preserves its moisture almost as long as bread made from spring wheat. It is, moreover, so sweet and well-flavoured, as to appear to some palates more like cake than ordinary bread. Independence of the large proportion of flour it affords, it makes much of the fine bread; 18 lbs. of the flour, having absorbed more water than the last described, gave 25 1/2 lbs. of bread.

Crop.	£.	s.	d.
48 bushels, at 8s. per bushel.....	19	4	0
4 ditto Tunnies, at 7s.....	1	0	0
Straw, 37 1/2 cwt., at 1s. the cwt.....	2	8	0
	22	12	0
Charges to deduct, as per Whitington,	11	0	0
Profit.....	£	12	0

The weights of 18 lbs. or 27 lbs. used for the flour to be baked are intended to be comparative experiments of weights of manes, it being generally understood, especially in baking bread and serving it out to troops, that 9 lbs. of common flour will make 14 lbs. of bread. All these, however, that I have experimented on afforded more; the two lowest having afforded, from 18 lbs. of flour, 22 1/2 lbs. of 22, and 25 1/2 lbs. the former of my own growth, the latter made from wheat imported from Rosstock and Danzic mixed.

In all the cases detailed, the preceding crop was not allowed to interfere with the wheat crop; the clovers and artificial grasses having been sown subsequently to the harvest under one height ploughing.

In some cases I have sown the clovers and grasses after the second hoing, but always, I am inclined to think, at some expense to the wheat crop; the coronal roots of which may be deprived of a share of their nutriment when the grass seeds begin to draw nourishment from the soil, and the thousands of mouths which they present may deprive the wheat of much pure air, and themselves exhaust gases which may be injurious to the plants.

The following sorts I have also grown experimentally, but not having raised them in quantities sufficient

to warrant a positive opinion, which probably might only tend to mislead, they are merely named. It is to be observed that a little calculation might have offered all the replies required by the conditions stated in the notice:—

The "Golden Drop" is one of the best red wheats, producing good produce in corn and straw, and a larger quantity of flour than such white wheats.

Harding's "Pride Red" is a productive variety, but rather coarse.

Rowan's "Ten-rowed Chevalier," or prolific, as well known, where it suits the soil and climate; it has borne a fine crop with me, but it unfortunately bore spotted wash on a pale red soil, owing no doubt to the soil which I obtained from Mr. Brown has self-lime, and is probably impregnated by a red soil; it is, I believe, a very fine variety.

"Gale's Hampshire" is an enormously productive sort of English wheat, which may be hereafter described.

"Fisher's Red." A very good variety.

"The Duck's Bill" wheat is very productive, but shedding good, and not very numerous.

J. LE COYEUR.

Table, &c., &c.
In order to present the particular points of comparison between the four principal varieties forming the subject of the Essay, at one glance, the results are appended in a tabular form.

Wheat.	Manure.	Quantity of seed per acre.	Time of Sowing.	Harvest.	Produce per Acre.	Produce per Acre.	Produce per Acre.	Net Profit.	
Whitington.	Keip Ashes.	Time of Time.	Time of Time.	Time of Time.	Grain.	Straw.	Chaff.	Weight of bushel.	
Jersey Danzic.	Keip Ashes.	Time of Time.	Time of Time.	Time of Time.	Grain.	Straw.	Chaff.	Weight of bushel.	
Belle-Vue Talavera.	Keip Ashes.	Time of Time.	Time of Time.	Time of Time.	Grain.	Straw.	Chaff.	Weight of bushel.	
Whitington, 3 bushels.	Keip Ashes, 9 qrs.	1 bushel of time.	1 bushel of time.	1 bushel of time.	33 bushels.	77-86 lbs.	2-3 lbs.	61 lbs.	£ 12 7 6
Jersey Danzic, 2 bushels.	Keip Ashes, 9 qrs.	1 bushel of time.	1 bushel of time.	1 bushel of time.	48 bushels.	45-57 lbs.	2-3 lbs.	61 lbs.	£ 12 7 6
Belle-Vue Talavera, 3 bushels.	Keip Ashes, 9 qrs.	1 bushel of time.	1 bushel of time.	1 bushel of time.	48 bushels.	45-57 lbs.	2-3 lbs.	61 lbs.	£ 12 7 6
Whitington, 3 bushels.	Keip Ashes, 9 qrs.	1 bushel of time.	1 bushel of time.	1 bushel of time.	33 bushels.	77-86 lbs.	2-3 lbs.	61 lbs.	£ 12 7 6
Jersey Danzic, 2 bushels.	Keip Ashes, 9 qrs.	1 bushel of time.	1 bushel of time.	1 bushel of time.	48 bushels.	45-57 lbs.	2-3 lbs.	61 lbs.	£ 12 7 6
Belle-Vue Talavera, 3 bushels.	Keip Ashes, 9 qrs.	1 bushel of time.	1 bushel of time.	1 bushel of time.	48 bushels.	45-57 lbs.	2-3 lbs.	61 lbs.	£ 12 7 6

N. B. In the column of profit in the last column the calculation is not made with relation to the respective values of the wheats, as to their productiveness in flour, which it might be, but according to the ordinary marketable value of good wheat; the straw is valued as intended for manure.

COMPARATIVE STATEMENT OF THE RESULTS.

From the New England Farmer.

THE SPIRIT OF THE AGE. AGRICULTURAL PAPERS, &c.

Mr. Editor.—The strongest characteristic of the age we live in is the spirit of progress and improvement which pervades the community: improvement in every thing susceptible of it—improvement in art—improvement in science—and, may I not add, improvement in human nature? There exists, in fact, a progressive civilization—and as long as its efforts shall be to subvert that right for wrong, to develop mind and stimulate genius to invention, it is to be hoped it may not subside.

Among the arts and sciences which have felt, in different degrees, the beneficial influence of the improving spirit, is to be named agriculture. (I allude particularly to our own.) The obstacles which have hitherto prevented this great and noble interest from being, as it is a right, better understood, and, as a science, more generally practiced, are fast being removed: aged error is receding before the quickened march of mind, the light of science, and the convincing deductions of reason and philosophy;—prejudicial prejudices, venerated rather for their antiquity than their worth, are giving way to the enriching truths of modern discovery.—Long-cherished ignorance and superstition are fast losing their baneful influence over human affairs, and men are beginning to see and appreciate the might of mind when enlightened by science.

It is well for the prosperity of our country and its every interest, that the improving spirit abroad is effecting a revolution in our husbandry;—a revolution of mind and a revolution of matter;—and, as these mighty agents of good or evil, 'never go back,' we can look with confidence for the consummation of the desired reform which is commenced and is rapidly progressing in those parts of our country whose light had reached, reason convinced, and practice demonstrated. Through all the clouds which yet hover around, the attentive observer cannot fail to discern 'the dawning of a brighter day for American Agriculture,—a day which shall give to the modern system of farming the ascendancy over the old 'exhausting system,' whose only honor is its age. We do not believe that error can long flourish when right is allowed to combat it:

"Forthwith, to each ye shall be giving: This is the way of God's blessing; While Error with its king, lies in a snare, Or dies and her worshippers."

The old system of cultivating the earth has little of right in any of its processes—it was conceived in error and brought forth in ignorance;—the modern system is the offspring of science, and bears on its front the impress of right: it is supported by reason, by philosophy, and by the experience of the intelligent; and as soon as it is generally understood it will be generally adopted: its intelligence calls for it, and it may be necessary for the perpetuity of our existence as a free nation; for, judging from the sad history of past republics, liberty will support no agricultural strength, and danger in a numerical preponderance.

What are the causes which have combined to prevent agriculture from advancing with the other arts and sciences? They are to be found in the prejudices of the farmer for ancient customs; in their (seemingly) unbelief in the progress of mind, and consequent aversion to improvements; in their hostility to what they term 'book farming,' which may be defined the practicing of scientific truths and the recommendations of the intelligent, promulgated through the press. These are the principal causes which have operated to retard the progress of improvement in the rural art. Thanks to agricultural newspapers, they do not now exist to the extent they did a few years since, but their prevalence is still extensive—by far too much for our national independence; for the pecuniary interest of the individual, and for every interest of the community, how shall it be lessened? By the dissemination of knowledge among the yeomanry. Knowledge, is power—the power which the farmer needs, the power of making every inch of land productive, and to produce to the extent of its capability,—the power of overcoming, by art, the obstructions of nature. The knowledge which will give this power, is not easily found and conveyed in agricultural papers, these are within the reach of every cultivator, and could be patronized by all—as well by the indigent as the opulent; for their tendency is, not to make the rich richer at the expense of the poor, but to make the poor happier in an increase of their crops, and show

them how to become independent of the rich. There is not a want of economy in refusing to become a subscriber to one of these publications. He who has but one acre might be harmed through this means how to cultivate that so as to triple his usual products, alike with him of his hundred acres; at any rate, either could not fail to be benefited by a year's reading of a paper, to more than triple the amount of the subscription price. This is proved in the case of those who are subscribers. It is a fact worth noting, that you seldom, (I might, probably, say never,) meet with a subscriber to an agricultural paper who does not set a high value upon it, or who is in the least dissatisfied with paying a dollar or two a year for its perusal. Such an investment of money is, in their opinion, the best they could possibly make, as none other, to them, yields so great an interest. I was told by a farmer, (a subscriber to Judge Baer's Cultivator,) that a plan which he found in that paper for steaming apples, potatoes, &c., for his swine, had been of vastly more consequence to him than a dozen year's subscription money. Such instances are common,—in fact, it is absolutely impossible, in our view, that some useful information or valuable hint should not be acquired in the course of a year's reading, which will not repay, many fold, the price paid for the paper. Farmers need to be made aware of these facts, and to be shown, through the only means of experiment, how fully founded is their notion of economy, in refusing to take a paper devoted exclusively to their interests.

These vehicles of knowledge are productive of good in another respect;—they take with the young,—with those whose minds are not yet warped by prejudice, nor fully imbued with false notions,—with whom any thing novel and plausible in theory, begets a passion for experiment. I will state an instance, the better to illustrate my meaning.—A farmer, of my acquaintance, in New Hampshire, was bitterly prejudiced against all other modes of farming than that practiced by his ancestors from the earliest generation, and transmitted unimpaired (and unimproved) to him. He was loud in his abuse and ridicule of 'book farming,' about which he talked as learnedly as he could of other matters whose discussion renders something more than a knowledge of the alphabet and two ideas necessary—deciding, in his wisdom, that it was 'intended for the wabby and college lark,' and that 'he was 'nt fool enough yet to plant his land with millberry trees! and bay corn to live on,' &c. This man had a son—had of some seven or eight years—who was much inclined to reading, and who had often endeavored to induce his father to subscribe for an agricultural paper, but without effect. The father had the misfortune to be stricken with a dangerous sickness, and the management of the farm devolved upon the son, who had obtained the father's consent to conduct it as he pleased, with the proviso that he should plant no millberry trees. As a preliminary step to the reformation contemplated, the son subscribed for an agricultural paper, and followed 'book farming' to the extent of his means; the swamp was resorted to for materials of compost (an idea which never entered the head of the father,) lime was purchased for manure; the swine were increased to increase the means of fertilizing the soil; root culture was adopted—alternate crop—manuring by turning in green crops—for which last act, in particular, he incurred the censure of his neighbors, who were unanimous in pronouncing him a 'fool,' 'foolish,' 'cack-brained boy,' &c.)—and such other improvements made as he found suggested in his paper.

The beneficial change which had been wrought in the order of things on the farm, was so palpable and manifest as to excite the wonder of the father at his son's unexpected success, and he could not help acknowledging that his prejudices against 'book farming' and agricultural papers were ill-founded and supremely foolish. This farm, under the father's exhausting culture comparatively a desert, and yielding but a poor return for toil, has, by the scientific and skilful management of the son, been made to teem with plenty and will reward for the sweat of the cultivator's brow. I have heard this farmer declare that his yearly profits did not exceed \$100, and grumble at his 'hard lot.' Under his son's administration affairs treble this amount is annually 'cleared.'

This case is no fiction—and if it were, it would be a faithful representation of many unwritten instances of like results.

If agricultural papers, then, are productive of so much good—if their tendency is to 'make two spears of grass grow where but one grow before,' no means should be spared to extend their circulation, let the farmer who is a subscriber induce his neighbor who is not, to become one also;—let agricultural societies lend all possible aid in the cause. I can conceive of

another method for advancing my object;—In every village there are generally two persons upon whom the citizens bestow extraordinary respect, or a sort of voluntary reverence, on account of their (supposed) superior intelligence—I mean the minister and the physician. Suppose these important personages should exercise the influence they are capable of, to the end of improving the agriculture of their towns, by inducing their fellow citizens who follow the plough, to read—to improve the mind in order to improve the soil,—could not the great object of enlightening the yeomanry—the hard-headed, honest-hearted yeomanry—be furthered by such a praise-worthy movement?

It is, chiefly, to the influence of such papers as the New England Farmer, the Albany Cultivator, the Genesee Farmer, and others of a like character, that our improvements in rural economy are to be ascribed;—that influence needs encouragement,—encouragement from States as well as individuals—it needs to be more widely diffused; for, in proportion as it is extended, in nearly that same proportion will the profession of agriculture be exalted in the public estimation, its operations facilitated, and its products increased.

J. H. D.

From the New England Farmer.

Labor and Labor-Saving Machines.

We conceive that many American writers, in urging the adoption of foreign agricultural improvements, overlook one very important ingredient in European farming, essential to a high standard of husbandry, and that is the extreme low rate of wages abroad compared with what it is in this country. In the old and fully-peopled countries of Europe, is a large surplus population, incapable of being landholders, or entering into commerce and the trades, from the arbitrary rules that govern them, and who must content themselves with the smallest daily pittance or starve. Such a population is more at the disposal of the farming than any other interest in society, and is one of the main pillars of the high and improving state of English, Scotch, and French agriculture. With us the farmer has no such resource. Ours is a new country, and, from the freedom and elasticity of action engendered by our institutions, and the inducements held out to exertion, all are striving to outstrip each other in the acquisition of wealth and reputation. Land is cheap and abundant, and there is ample room for action; and every man who has a common degree of intelligence and industry, may become a landholder. Men follow their natural inclinations, and prefer being independent citizens and their own masters, to being in the employment of other individuals. Under this state of things, those pursuits that are carried on with much manual labor, are attended with the most expense to those engaged in them, and meet with no small obstacle to their success in the fact, that they create a demand, for which the supply is by no means adequate. American farming is one of these pursuits; its various operations being almost entirely performed by bodily labor, manifested in a great degree, by nature or art. To every pursuit and profession among us have the sciences and arts lent more assistance than to our husbandry; and we believe that this is one very great reason why all other pursuits are so much in advance of it. The innumerable results of human invention, the application of the laws that govern the operations of nature, to the daily avocations of man, have carried us forward with an incredible rapidity as a commercial and manufacturing people. They have been capital and labor to us, amply supplying the deficiencies of both.

Amid this hurrying forward to perfection of almost every calling amongst us, we would not say that our agriculture remains where it stood fifty years ago, for we believe it has advanced within that period—but we find it creeping on at a (comparatively) snail's pace, unassisted, in a great measure, by art or science, and harassed by the same impediments, that hampered it in the days of our fathers. We speak, of course, of the general state of American farming, as manifested throughout the country, and would not include those exceptions in districts and individuals, that, from their rarity, do us no more honor.

With nothing have our farmers had to contend more than this scarcity of labor we have referred to. The high rate of wages has eaten up the profits of the farm, and debared them from making many improvements in their husbandry; and this the more so, inasmuch as the raising of crops for the market, requiring much and constant manual labor, has been the prevailing agricultural interest. This obstacle to their more rapid improvement and success has been so prominent and palpable, that we have often wondered at the neglect and indifference manifested by many of our farmers towards those implements and machines that have been offered

* It need not be understood that the freedom of a country, agriculturally great, is more secure than that of a country, so only in a commercial sense.
* However independent we may think ourselves, we cannot, in truth, be styled independent till we cease to rely on foreign nations for some of the essentials of life.

them from time to time, for abridging and facilitating the labors of the farm.

Husbandmen should remember that just in proportion as they save in the time of performing their daily operations, just in the same proportion do they economize in the item of labor, and in the expense incurred by it. As for instance, if my two hired men, at the expense of a dollar a day a piece, can thresh with the flail, one hundred bushels of grain in ten days, the threshing of my grain will have cost me twenty dollars, taking no account of the inevitable loss by waste. Now if by the use of a threshing machine, at an expense of two dollars per day, with the assistance of a man and a boy at one dollar and a half per day, my one hundred bushels of grain can be threshed in two days, it will be done at an expense of seven dollars instead of twenty, with a gain of eight days' time. We presume the items in this estimate are the most, but we believe the difference in time and expense will not be found to be much exaggerated, and will serve to illustrate our proposition, that whatever is saved in the time of performing the daily operations of the farm, is so much gained in the wages of labor.

We advance another proposition, that, not only do we, by the use of labor-saving machines, economize in time and the expense attending labor, but also that just in proportion as we economize in those two items, just in the same proportion does the same amount of capital go farther in the cultivation and improvement of the farm. If I have twenty dollars to pay for threshing one hundred bushels of grain by the flail in ten days, and I am, by the use of a threshing machine, to have the same amount threshed in two days for seven dollars, I have actually gained eight days and thirteen dollars, which may be spent in other duties upon the farm, or, which is the same thing, I can with the same amount of capital, perform nearly three times as much labor in three quarters of the time.

We would suggest then, on the strength of these two propositions, that, by the use of labor-saving implements, our farmers may perform the usual labors of the farm at a much reduced expense, and, with the same outlay of capital, may also accomplish a very much increased amount of labor, and consequently an increased production. We know that it will be objected, that this appears very well upon paper, and may accord very well with close calculation, but that we have omitted to take notice of the item of the first expense of all machines, more particularly those of modern invention, and of the constant wear-and-tear attending their operation. We have made a liberal allowance for all this, in the two general propositions we have advanced—the more liberal, inasmuch as wherever labor-saving machinery upon farms has come under our notice, the expense of purchase and repairs has been more than amply made good by the expense saved in the wages of hired men, by the superior and expedient manner in which the various operations of the farm have been performed, and by the greater amount actually yielded.

Our limits will allow us to record but one instance of the successful employment of labor-saving machinery upon farms, and that is no figure in the farming, in the instance referred to, that we more admire than the manner in which art and science are made to supply the place of several pair of hands. We will only say that the gentleman referred to is one of the most intelligent and distinguished farmers in the State of New-York, whose practice as well as his experience and opinions, may be most confidently relied upon. Our friend, in the first place, has upon his farm a portable horse power, a machine in too common use to need a description, and which, by the medium of the wheel and band, is capable of giving motion to machines for various purposes. In connection with this power, he employs a grain-thresher, (of whose invention we do not recollect,) by which his grain is threshed in a third or quarter of the usual time, with scarcely any of the waste attendant upon the use of the flail, and which, when he is not using it himself, is passing from farmer to farmer to expedite the operations. By the aid of the same horse power applied to a simple circular saw by means of a band and wheel, he is enabled to effect the cutting of his winter's fuel, in a very few days (we had almost said hours) without any of that waste of chips, that, in a series of years, makes no small item in a farmer's economy. The same band and wheel transferred to his grindstone, and a pair of handspikes saved at the crank, which by the increased power and velocity, two can be employed at the stone with greater ease and expedition than one could be by the aid of the common handle. The power obtained by the wheel and band, again transferred to his hay and straw cutter, and a couple of hours work prepares out feed for a stock of twenty head for several days, and thus brings into successful operation a machine, that has not been in general use for a large stock of cattle from the great length of time required to cut the food by manual labor. By

the use of the horse-rake, he contrives to save the labor of several hours and men in raking his level lands; and by a simple machine, we believe of his own construction, he plasters an extent of land in a few moments, that would require an hour or two to press over, in the plow should be sown by hand. Indeed he found the machinery to perform for him every operation on the farm, which by the common *time and wages* paid to hired men,—a system which he finds more expensive than the old-fashioned method of entire hand labor at the outset, but infinitely, *infinitely* more economical in the end.

And now when we ask ourselves how many of our farmers will be convinced of the truth of what we have said sufficiently to practice upon it, we find but a desponding answer in our observation upon the prevalent systems of husbandry about us. When we trace the adoption of improved agricultural implements and labor-saving machines, we are met with excuses of a want of capital to meet the first expense,—of an inability to use successfully many implements and machines, from their complicated character,—and from a want of confidence in all improvements in agricultural implements, from the repeated instances of quackery under which they have suffered, in the numerous machines that have been peddled upon them as useful inventions, and which turned out to be mere clap-nets. In reply to all this we can only say, begin on a small scale, but do not be afraid to venture. Whether it be a horse-rake, or an improved plough, or what not, incur the first expense and its use will repay you four-fold. Be not alarmed because the dollar you invest to-day will not return to you to-morrow, but be contented to wait, if there is any reasonable hope that it may come back to you at a more distant day, doubled or quadrupled. And remember when you purchase, that the object of all improved farming tools or machinery, should be to perform, in a given time, a greater amount of work in a more thorough and economical manner, than the implements for which they are substituted. With this object in view, purchase the most simply constructed machine, and neither endeavor to do or be discouraged because after a few trials they do not fulfill your expectations. Let them be well tested, and every attempt made to discover the cause of failure before they are given up. Be careful that the cause be not in the employer rather than the machine. And the farmer's well known intelligence and acumen must be his protection against the employment of machinery or tools of farming of any sort, that are of doubtful utility. By placing a proper degree of confidence in the experience and opinions of those who have fairly tested various farming instruments, and by exercising his own judgment critically, there is no reason why the farmer more than any other man, should be the dupe of such inventions.

We have already extended our remarks to a greater length than we had intended. But the importance of the subject must be our only apology, and we shall be content with having drawn any to an attentive consideration of what we have said, and the various conclusions to which our suggestions may lead. H. V.

From the *Sisk Journal*.

CHOICE OF OCCUPATION.

At the present period of general derangement in almost every department of business, it is natural for all in jarring minds to cast the eyes around in search of some pursuit calculated to yield them a support, or to advance their pecuniary resources. And where, let me ask, does the mind meet a certain response, except from the productions of the soil, and where else can one look for stability, as to the safety of his investment, and to an ample return for his labors.—What other pursuit can offer to him a sure guaranty of a comfortable support for his family, and permanent provision for his children. In commercial pursuits all is chance and uncertainty, and he who can boast of being on the ascendant to-day, can only claim to occupy the reverse position to-morrow. The history of whole streets in our mercantile cities, is but a record of the rise, and the downfall of the occupants. It is a melancholy reflection, that such are the uncertainties attendant on commerce, and on mercantile affairs generally, that every six or seven years witnesses a complete revolution in the mercantile class of the community. And yet such has been the folly and absence of proper discrimination among parents generally, that apparently, it has been their most anxious desire to devote their sons to mercantile pursuits, and to risk their property on changes as fluctuating and more uncertain, than the turn of the die. It is to this gross misdirection of the mind that many branches of agriculture have to this day been totally neglected, although offering the most bountiful returns to those who would engage in them. Providence planned the vine only in

Persia, Syria, and in North America. To France and Italy, he tendered no such bounty. And yet we see France, whose climate was so unpropitious to the vine at its first introduction, that it could hardly survive on its most southern shores, now her vine-cultivation beyond every other nation by the immense accumulation of wealth for ages her vintage has poured into her bosom. We see that country becoming affluent and powerful, not from the mutual productions of her own soil, but from those which she has borrowed from men favored chance. Look at her olive groves, and the whole race of olaginous plants from which she derives the immense quantity of her choicest oils, sufficient almost for the consumption of the whole earth. Look at her groves of almonds, figs, prunes, and almost every other fruit calculated to give support to her citizens, and abundance to her commerce. And lastly, look at her immense and increasing plantations for the silk culture, rivaling in profit all her other pursuits. Not one of these invaluable productions is the gift of nature, but are all exotics transplanted to her soil.—For our selves, we may claim both the vine and the mulberry, as pre-eminently our own, and planted on our soil by the God of nature. And thus favored, shall Americans stretch and yield precedence to nations possessing fewer natural advantages? Shall we stand by the development of these resources, which God himself has piled out as peculiarly calculated to enrich our country, and extend our sphere of constant happiness? We trust not. We trust that we shall not have, for the future, any rival, among us, who doubt the triumph of American skill, enterprise, and industry, where any other nation dare claim a success. It is such men who retard the national advancement, and are a clog to its prosperity. They are worse than drones, for they impede the labors of the industrious. Men, professing such opinions, ought to receive the withering scorn and denunciation of a man who claims to have to superior knowledge in the art, and which acknowledges no competition in their labors, but that which ensures for them the most triumphant success.

How to make Agricultural pursuits pleasant as well as profitable.

For ages the employment of the husbandman has been looked upon as dull, uninteresting work. It has been thought to be a dull, plodding occupation of the hands and not of the head. And there has been too much foundation for such an impression. The present cultivation of years not long by-gone, did little with this head to dignity or enliven the work of the hand.—A change for the better seems now near at hand. Perhaps in your day, farmers may be generally more intelligent, more intelligent, and more able to bring the fruits of science to benefit them in their moral labors, and to give them interest and delight in their occupations. But what you others do, I hope you will take such measures as will convince yourself, if not others, that agricultural employments are as interesting, intellectual and pleasing pursuits as any with which they may be put in competition. I know of no method by which you can more effectively render them so, than by employing your mind upon your work. Most assuredly the more your mind is employed upon your work—in tracing effects to their causes, in accounting for failure and disappointment, in understanding the operations of nature, in devising improvements, &c.—the more interest you will take in your employments, and the pleasure and gratification you derive from them. Moreover this is not only the way to make your pursuits pleasant, but it is the way to make them profitable also. Your mental operations must be well-guided and judicious, indeed if they do not lead you to the discovery of means whereby you can do more produce out of any certain amount of labor and expenditure. The most intelligent farmers, you may easily convince yourself, if industry is not wanting, generally succeed in making their farms the most profitable. But what I wish especially to inculcate upon you, at this time, is, that you will feel more interest, more pleasure, more conscious dignity in your pursuits, the more you occupy your mind on the subject.

Agricultural schools would aid in this elevating agriculture.—*Albany Cultivator*.

ORIGINS OF THE WORD "FARM."—In the Saxons time, the estate which the Lords of Manoe granted to the freemen were at first but for years, with a tender of a rent, which in these days were of corn or victual, and thence the houses so made were called *farms* or *farms*, which word signifieth victuals; but since ensuing turned the victuals into money, and terms of years to terms of life and inheritance, retaining the name and those called *manors*, or rather of those persons that were required or free.

NEW GENESEE FARMER.

JANUARY, 1840.

CORRESPONDENTS WANTED.

We earnestly solicit our readers to become correspondents of this paper, for in all we can do, we must depend greatly on them for the interest and value it may possess. A vast amount of valuable information doubtless exists among our intelligent farming population, which has been discovered through their experience, and is known to the disservice of all. This information, if contained in a list and spread, would be of great value. To each one contribute his mite, and the work will be done. But many are unacquainted with writing, and have a reticence for a printer. No matter, we will do the facts and the will of our countrymen in a proper manner. It is not objectionable to have the names of our contributors printed, but the editor reserves the right to suppress any name, however plain the words which may occur. The style of the letters, to be terse. Neither say the amount of your property, nor say that you so much want, as a specimen of your farming, as to give you a list of things, though not nearly so valuable as the ordinary one. We do not wish so much the amount of your crops, as of full, healthy, natural production.

There are some who have seen the accounts of their production, the size of the harvest, yearly profits, &c. The reports of such would be of great value, and we earnestly request them to be enabled to furnish them, whether of whole farms or of a single crop, to send them to us.

THE CLAIMS OF HORTICULTURE.

EXHIBITION FOR 1840.

Our countrymen feel well disposed to advance the great interests of the culture; but, in the course of the year, we shall by no means neglect the important claims of Horticulture. It contributes to the enjoyment and comfort, the wants and pleasures of life; its practice affords such healthy and agreeable exercise, and such delightful objects for contemplation, that, whether we view it as a means of supplying our wants, or as a source of pleasure, or in promoting the mind, it must be considered a subject worthy of our especial attention. We shall aim to encourage, among our readers, a more general resort to this useful and important art, by diffusing such information as will tend to promote successful practice.

About ten years ago, a society was formed in this city for the promotion of Horticulture in this section; and, for a number of years, its efforts were very successful. The most interesting and profitable were well attended, and highly interesting. A degree of taste and cultivation was excited, the good effects of which were soon manifested in the gardens of this vicinity, and the influence is still seen in the abundant supply of fine fruit, flowers and vegetables, which our market and gardens afford. Owing to several unpropitious seasons, however, the exhibitions were omitted, and the spreading pecuniary embarrassments have so far exceeded the public mind, that for several years past, no contemplated efforts have been made for the promotion of Horticulture.

Some of the friends of the cause have several times expressed the propriety of re-organizing a society; others thought it was not best to make the attempt, but we, in 1836, that latter times are at hand, or that the minds of the community will become better reconciled to existing circumstances.

It is proposed, however, that, whether a society be formed or not, we aim, and ought to have, an Horticultural Fair or Exhibition, the coming fall, and, in order to give it additional interest, and promote its objects, it is decided to have the exhibition take place at the same time as the great fair of The Rochester Mechanic Association.

A fund will be raised for the purpose of awarding premiums for the finest Vegetables, Fruits, and Flowers. Subscriptions for this purpose will be received at the Rochester Mechanics Association, and New Genesee Farmer office. Particulars will be published hereafter.

To Agents, and the Friends of Agriculture.

With this number we send subscription lists to such persons as we suppose feel sufficient interest in the cause, to give it the attention; and we earnestly solicit them to aid us, and benefit their neighbors, by extending our circulation among them. This should be done without delay, in order that our readers may enjoy the benefits of these long winter evenings. Besides, it is very desirable that we should receive our subscribers' names as soon as possible, in order that we may form some idea as to what number it will be necessary to print. It may be remembered that those who subscribed late last season, could not obtain back numbers, so as to make their volumes complete.

REMEDY FOR HARD TIMES.

It cannot be denied that the times are hard—they are very hard. Not only do the merchants and mechanics complain of failures and bad arrangements, but even the sturdy farmer begins to feel a painful sense of anxiety in the region of the pocket, and in the ordinary dread of duns and tax-gatherers. Indeed, all will admit that they are afflicted, more or less. Altho' it is true, and how they ask, what is the remedy? The answer is soon told—*earn more money, and spend less!* "Oh," say they, "that is a strict precept, more easily preached than practiced. We have ways worked hard, and studied economy, and now, if we have got to work harder, and practice more economy, the times were from the disease, and remedy as we have applied the best." But, stop, reader, if it is not possible for you to learn how to work to better advantage, you are to earn more money without working harder. And you can not learn how to spend your money to better advantage, unless you spend less, without seeing your money go. All this, we tell you, can be done, and our aim will be to show how it can be done. We ask you then to subscribe for the paper gratis, and then say candidly whether we have not earned from it some information on respect to the profits of such a plan, which will enable him to increase his profits, or to reduce his expenses. We then invite him to take a few more lines, and read it each month, and let his family read and learn as well as he. This not benefited him, we will add, we will be glad to have you write to us, or send us a card, and we will send you a copy of the paper, and if you are in the neighborhood of the office, we will cheerfully receive you in his half dollar, and confess we were grandly mistaken.

AGRICULTURAL IMPLEMENTS.

Baldwin's Corn Planter.

The introduction of improved implements, or labor-saving machinery, next to the diffusion of knowledge, is the greatest means of improvement in any country. But especially is it the case in a country like this, where, owing to a sparse population, and the cheapness of land, the number of laborers is so small, in comparison with the amount of labor and where, not unfrequently, the high price of labor absorbs all the profits of the farmer. Or, what is worse, his land is only half tilled, or his crops are neglected or destroyed, from want of sufficient help.

Much has been done, during the past few years, by way of constructing and introducing improved agricultural implements, in some parts of our country; but still much, and in some places, every thing, remains to be done. In our efforts to advance the cause of agriculture, we shall take equal pains to obtain, and bring into notice, every new or improved implement, which appears to be of value or worthy of trial.

The first we shall mention, is *Baldwin's Corn Planter*, a representation of which is given above. It consists of a square frame, 5 feet long and 15 inches wide, with two wheels near the front, 19 inches in diameter, and one a little back of the centre, 2 feet in diameter, having a broad iron rim to roll the ground on the seed; beneath are three cultivator teeth, or hoes, one of which opens the furrow for the seed, and the other two cover it over and form a slight ridge, which is immediately rolled smooth by the large wheel. On the top of the frame are two handles, behind, to guide the machine, and a hopper in front to hold the seed, the bottom of which is closed by a movable slide, with an aperture in it to allow the seed to drop through. On the shaft of the centre wheel are a number of teeth or cogs, which, as the wheel revolves, touch a spring which moves the slide, and thus drops the seed. These cogs are so arranged, that, by shifting the position of the spring, the seed may be dropped at the distance of 10, 15, 18, 24,

or 36 inches. The slides are of wood, easily made, and, by having them with apertures of different sizes, seeds of any size, or in any quantity, may be dropped, from that of turn p, to a hill of corn or henn.

It is necessary to observe, that with all machines of the kind, the seed must be of such a nature as will readily fall through an aperture. Thus, very light, or irregular shaped seeds, cannot well be planted. It is also necessary that the ground be tolerably smooth, and in good order. This machine might be used with advantage on a majority of the farms in Western New York, and we think will be found highly valuable. It is said that a man, with a horse and a boy, can plant 8 or 10 acres of corn with it in a day.

We understand that it was used the past season, in some of the central counties of this State; and we hope some of our friends in that section, will send us some account of its operation. The machine may be seen at the Rochester Seed-Store, where a supply may be expected for sale in the spring.

Other implements will be described in our next.

For the New Genesee Farmer.

ROBEN POTATOES AND TUSCARORA CORN.

MISS. HAYES:

This is called an age of improvements, and I cannot see why we Farmers should continue treading in the old beaten tracks of our forefathers, any more than men of other trades and professions. For my part, I am one of those who love, occasionally, to make an experiment, and "find out some new thing." It is true, I am sometimes "hoaxed," or disappointed, owing to my own ignorance or the misrepresentations of others; still, I find in the end, there is always a balance in my favor.

I am in labor to Agricultural papers for much of the pleasure and the profit which I derive from my pursuit; and feeling that it is my duty to make some little return for the benefits received, I will give you occasionally, some account of my experiments, for the benefit of the readers of the "NEW GENESEE FARMER."

I purchased last winter at the Rochester Seed Store, two bushels of *Roben Potatoes*, at \$5 per bushel. I thought this was a great price, but the old maxim, "nothing risked, not much gained," led me to hope that my gain would not be small. I planted the potatoes on a light sandy loam soil, which was cropped with clover the year previous. A tolerable dressing of manure was spread on and turned under, and the surface well harrowed. I sent the potatoes into sets of one or two eyes each, and planted them in rows 3 feet 2 inches apart, and the sets 18 inches apart in the row.—they had one dressing with the cultivator and hoe, and were hilled up with the plough. They were harvested the middle of October, and yielded in good round measure, *one hundred and eighteen bushels*—from only these two bushels of seed.

The merits of this potato are, in my opinion, worthy of high consideration, especially its great productiveness. I truly think that twice the above quantity might be raised from the same amount of seed, after its habits become better understood. As to its qualities, for the table, I agree with the numerous accounts which have been published, in pronouncing them *good*—and I think no one need find fault on that account. At any rate, it cannot be said that they favor of the China Tree Corn "imposition."

TUSCARORA CORN.

So much has been said and written of late, on the subject of Corn, that it appears to me remarkable, that so excellent a variety as the *Tuscarora*, (or as some call it *flour corn*), has been so rarely mentioned in our agricultural papers, and is so little cultivated. The reason, it seems to me, must be, that but few persons know any thing about it, or understand its excellence in constituting some of the luxuries of human suste-

rance. It is true this corn is not so heavy, or so profitable for making whiskey, or making pork, as some other kinds; nor is it as early as the red blaze or Dutton; still, it is a certain and profitable crop. More ripened finely last season, and would have done so this, had I not delayed planting until very late in the spring, on which account only half of my crop ripened.

This corn when ripe, is of a marble whiteness, and can be ground fine like flour, the meal being none of that rough harshness incident to the common meal.—Every person of correct taste, who "knows what is good," is of course fond of "Johnny Cake." And let such a person once eat of it, rightly prepared from this corn meal, I am sure he will readily exclaim, "give me such evermore." This meal, when mixed with wheat flour, makes very superior Bread, besides which, it is exactly the thing for Pancakes.

The excellence of this article cannot be duly appreciated, unless rightly prepared; and as it requires rather different management from common, I will just say that one or two receipts will be given with pleasure, if thought desirable.

Yours, &c.
H. N. LANGWORTHY.

Irondequoit, Monroe co., N. Y.

Mr. Langworthy will please accept our thanks for his communication, the reading of which has sharpened our appetite. We intend to call on Mrs. L. ourselves in a few days, to solicit the promised receipts for our next paper. And in order that we may be able to recommend them without fear of "hoaxing" our readers, we feel that it is very desirable that we should have their excellence satisfactorily demonstrated to us, according to the rules of good faith.

Eds. N. G. Farmer.

For the New-England Farmer.
"FARMERS' MEETINGS."

The prevalence of these meetings in some neighborhoods, and the well known respectability of many individuals who take a prominent part in their proceedings, sufficiently indicate that farmers are reaping the full share of the disastrous results which have followed the derangement of the financial concerns of our country. Barely have the prices of produce been so much depressed, and the amount of money in circulation so extremely limited. He who calculates his loss when a hog and pork would pay his mechanic's and merchant's bill, and leave him a comfortable surplus to contrast the operations of his farm during the ensuing year, may find his pockets emptied, and his bills unpaid. It would seem to be an inappropriate, that we should be called together to take into consideration the present distress, and to "devise means for our relief." Much emphasis is made of those who manage the affairs of government, of the "prodigality of the Banking interest" of our country; and of the diversity of means of trade into the hands of wild speculators, who have overrun us like the locusts of Egypt. To those who entertain these opinions, I would say, "be every man be fully persuaded in his own mind." It is a part of the duty of a good citizen, to exercise the watchfulness, and to bear the responsibilities of a sovereign; and closely to scrutinize the movements of those institutions which are a channel for the common benefit: he would do well also to take upon consideration that he is not necessarily rich, because of the high prices of the village lots in his neighborhood.

But in addition to these, I would respectfully suggest to the conductors of "farmers' meetings," the propriety of introducing for discussion on the following topic, which would prove quite as beneficial, in a preliminary point of view, as either of the foregoing, or perhaps any other considerations. It is this: "The general adoption of systematic processes, adapted to the improvement of our farms, and the increase of their productiveness."

Could an enlightened method of farming become general, we should, to a great extent, become independent of the fluctuations of the money market, and of the high or low prices of labor; not that it is very desirable that there should be as uniform, and properly regulated as possible, but I think it is susceptible of the clearest proof, that labor judiciously bestowed, will, under almost any circumstances, ensure the proprietor a handsome return. To see this matter in a clear light, it may be interesting in future numbers of the "Farmer," to compare the common mode, with the system to which theory and enlightened experience have given a decided preference.
WM. R. SMITH.

Cooking Potatoes.

When you boil potatoes for dinner, pare enough for dinner and breakfast; throw a little salt into the water in which they are boiled, and when done, pour out the water carefully, and let the potatoes stand by the fire a few minutes. You will find them much better than when boiled in the common way without paring. Take what are left at dinner, and wash them with warm, adding a little cream and salt; then put them in a lute-pan, and, in the morning, you have only to set the pan into the stove, or before a brick fire, for a few minutes. You will find this excellent. Some people use butter instead of cream, but the cream article is prepared only with the latter. Ask the Grocer.

Water-Proof Composition for Boots & Shoes.

To a pint of Sassa Oil, add four ounces of Gum Elastic, Anla Rubber, cut in a slice, and one ounce of Lamp Black. Let it stand three or four days, for the gum to dissolve, then strain it well, and the paste is fit for use. Rub it on to both sides and upper, three or four times, before a fire, as long as the leather will admit. This composition renders leather soft and durable, as well as impervious to water.

THE MAGAZINE OF HORTICULTURE.

EDITED BY G. H. NORTON, BOSTON.
Published Monthly—40 pages—\$3 per year.

The sixth volume of this valuable Magazine commences this day, January 1st, 1863. We have read it from its common end, and cannot let this opportunity pass, without recommending the work to all of our friends who wish to enjoy the elevating pleasures of horticulture. It is of the plan of the English Magazine, and is the only work of the kind in the United States. It numbers among its contributors more than fifty of the most eminent horticulturalists, Botanists, Nurseriesmen, &c., in the country. I should be in the hands of every one engaged in such pursuits, who wishes to understand his business, and keep pace with the improvements and discoveries of the day.

Subscriptions are received at the Rochester Book-Store, where the work can be examined. Those subscribers, in this region, who have not paid for the past year, are requested to send in the amount with our editor.

We extract the following article from the September number of this Magazine:

On the Cultivation of the Calliflower.

On the cultivation of the Calliflower, as practiced on the farms of C. J. Walker, Esq., at Frankford, near Philadelphia. By Mr. GRANNY LEE.

Having met with unprecedented success in bringing the calliflower to the highest state of perfection, by the same simple process of cultivation as the cabbage, and with the hope of instructing others to do so and do likewise, I am induced to lay before you an extract from my garden diary.

I sowed the seed of Messrs. Landreth & Co., sowing it, broadcast, Sept. 1st, 1858, in a bed of common garden manure.

On October 26th, removed the plants into a cold frame of the same kind of manure.

On the 16th, 1859, transplanted them into the open garden.

"May 29th, cut for the use of the family."

These noble plants stood in the open garden, undisturbed, and with their neighbor, the cabbage, patiently endured the "pithy" planting of the soil.

My success is fully announced by the following statement of the circumference of six heads of the flowers, wholly divested of their leaves.

Table with 2 columns: No. and Circumference. No. 1: 3 feet 1 inch. No. 2: 2 feet 7 1/2 inches. No. 3: 2 feet 10 1/2 inches. No. 4: 2 feet 8 1/2 inches. No. 5: 2 feet 7 1/2 inches. No. 6: 2 feet 5 1/2 inches.

The circumference of the largest flower, if it stood in the garden, and taken at the extremity of its leaves, was 13 feet 7 1/2 inches.

I continued to cut abundance of fine flowers, from May 29th to the middle of July.

My object, in this instance, is to give publicity, especially to the fact that this immense size can only be obtained from fall plants. In a subsequent number of yours, and I shall feel a pleasure in communicating and corresponding with you upon the subject of horticulture.

I am, gentlemen, respectfully yours,
GREGORY LEE.
Frankford, near Philadelphia, July 31st, 1860.

A Good Crop of Indian Corn.

The following account of large crops of corn shows the advantage of good culture and the selection of the best part of the crop for seed. What gives so great a superiority to some varieties of corn or other vegetable is a question that naturally presents itself to the inquiring mind, as he learns of an excellent variety, or he holds with admiration the astonishing product. It is attention in selecting the best of seed, and we have our mind fixed upon readers is the great importance of this subject.—Viable Farmer.

BROWN CORN—MODE OF CULTURE.

Accordingly to our promise last month, we proceed to state the manner of tillage by Mr. Brown, in raising his abundant crop of corn. To this excellent method of culture may be attributed in part, his success which method would apply with benefit to any other kind of corn; but his corn we regard as superior in kind to any with which we are acquainted. Both the corn and the culture we consider worthy the attention of farmers.

Commencing in the Spring—his field, having been the previous season sown to English gram, and in the fall the stubble plowed in—first, 25 cart loads of rotten manure were applied from the window heaps and yard, and the field was again plowed deep, burying the long manure and bringing the rotton to the surface and mixing it with the soil—the corn was then planted in hills two feet apart each way—three stalks only were left to grow in a hill—hoed three times—at the first hoeing, great pains were taken to clean the hills entirely from weeds, and at the other hoeings, the surface of the ground was merely passed over to cut up the weeds and loosen the top of the soil—keeping the surface of the ground all the while perfectly level, or in other words not hilling up in the least—used no plow, cultivator or harrow, after the planting, and did all with a hoe—cut the stalks at the usual time. This year he hoed part of the field but twice, the corn being so thick it was difficult to pass about among it without breaking the stalks. Crop, 146 bushels.

Mr. Lumpley, a neighbor of Mr. Brown, who raised 131 bushels on an acre, pursued a similar method of culture.

This mode seems to us to be a good one, although different soils may require different treatment, and the season may in a vary the result. In a season like the past, wet and cold, we have no doubt but applying a part of the rotten manure in the hill, would be better than spread the whole; but in a dry season, manuring in the hill is less beneficial. Manure in the hill bringing the corn forward earlier, and if the soil is sufficiently rich, so that the well fed roots, on striking out from the manure, are not starved and checked in their growth, is doubtless beneficial on late soils. We took particular notice of a field this year, on part of which the manure was spread, and on the other part it was applied in the hill—the latter was full a fortnight earlier than the former, at the time of cutting the stalks. Last year we had a piece which was manured in the hill, but the entire soil was not made rich—the corn grew well for a time, but soon it stopped growing and opened very early, yielding a light crop. The reason of it is plain—the corn grew well while the roots were surrounded by the manure in the hill, but when they grew beyond the manure, they starved.

The prominent points in Mr. Brown's method of culture is, spreading two coats of manure, first that which is rotten, and plowing that in deep, which brings the rotten manure near the surface to nurse the tender roots of the young plant, and leaves the long manure deep to feed the larger plant and mature the full ear; and second keeping the surface perfectly level. Mr. B's success proves the method a good one, and reason apparent.

The second planting of corn, does not amount to anything—the stalks are barren of ears. This fact has been observed by many, but the cause could not be ascertained. Now the reason is very obvious—it is this: The main part of the field is out of the tassel before the late planted gets in the tassel, the consequence of which is, the silk of the late planted does not receive sufficient pollen from the tassel to produce the kernel of the ear. For the same reason a stalk of corn standing alone will not produce a full ear.

In case of corn not coming up well, or being destroyed by worms, we would recommend supplying the deficiency by planting beans or potatoes; or if not so late but that a second planting would answer, to plow the field and plant the whole anew. We have the past season tried (to our satisfaction) the second planting of scattering hills when the corn has failed. The product was better and nothing else. We noticed whole hills of this second planting of three or four stalks, without a single ear or set for an ear, any more than is found upon a stalk of broom-corn.—Cheshire Farmer.

LAST SPEECH OF JUDGE BULL.

The following extracts are from the Address delivered before the New-Haven County Agricultural and Horticultural Societies, September 25th, 1839, by the Hon. JAMES BULL, whose lamented death took place at Danbury, the following week.

I appear here, gentlemen, by invitation, to address you on the cultivation of the soil, which is the object of the association here convened to promote improvement in. I have been prompted in the undertaking, rather by a desire to render a service, than from a confidence in my ability to perform one; and in the few remarks I have to offer, shall need much of your indulgence, for defect in style and deficiency in matter.

Agriculture and Horticulture are intimately related to each other. They both depend upon the soil, and animals and plants which it nurtures, for support, for profit, and for pleasure. They both administer to our wants and comforts. They are governed in their operations by the same natural laws. Agriculture has cognizance of the farm, which supplies our principal wants: Horticulture, of the garden, which administers to our more refined appetites, to our health, and to the rational pleasures of the mind. The one gives us bread and meat, and the materials for our clothing; the other, the choice delicacies for the table, and multiplies around us the charms of floral beauty and rural scenery. Both tend to beguile hours of useful industry and sober reflection, and to improve us in all the social relations of life. It is befitting, therefore, that institutions designed to foster and promote improvements in these primary and associate branches of labor, should unite in their anniversary celebration, and in returning thanks to the Supreme Being, for the bounties of a fruitful season.

Of the utility of these celebrations, and exhibitions of the products of the farm and garden which are made at them, I have no kind of doubt. They bring to public notice whatever is new and most valuable, in a business which highly interests us. They perform the work of years, in diffusing useful knowledge in all the departments of rural labor. They awaken, in the bosoms of hundreds, the dormant powers of the mind, which otherwise might have slumbered in apathy. They excite to industry, emulation, and to the study of those laws which every where control the visible creation, and which enlighten and reward all who humbly seek and follow their counsels. Nor is it the cultivator of the farm and garden alone that are to be benefited by these exhibitions. Whatever tends to increase and improve the products of the soil, serves to augment the common stock, and enables the grower to supply the market with more and better products, and to buy more liberally of the other classes in return. The merchant, and the manufacturer, the mechanic, and the professional man, have all, therefore, as deep an interest in promoting the improvement of agriculture and horticulture, as the farmer and gardener have. Society is in some measure a joint concern, at least so far as relates to what are termed the producing classes, the more they earn by their labor, the greater is the accession of substantial wealth to the community. The amount of honey in a hive, depends not upon the number of bees which it contains, but upon the labor and skill of the working bees. The farmer virtually provides for the other classes, and sits at the same time the principal patron and customer; and although his labors are too often held to be low and menial, by those who cannot or will not appreciate their value, his condition affords the best criterion by which to judge of the welfare of those around him. No country can long flourish, or preserve its moral and physical health, whose agriculture is neglected and degraded. The amount of a farmer's sales, and of his purchases, will depend upon the surplus products of his farm, and upon the profits of his labor. Double these by an improved system of husbandry, which I feel assured can be done, and which has been far more than realized, in many old districts of our country, and you will double the substantial wealth of the neighborhood, and impart energy, vigor, and activity to every other department of business. If we look to Spain, to Portugal, to a great portion of Italy, to South America, or any other country where agriculture is neglected, or holds but a subordinate rank, we shall find a degraded population, characterized by superstitious ignorance, poverty, and crime. Every class of the community, therefore, has a deep interest in promoting the improvement of the soil; and all should willingly contribute their aid toward enlightening, honoring, and rewarding those who are honestly employed in its cultivation.

The great obstacles to horticultural improvement are ignorance of the relative merits of different kinds of fruits and culinary vegetables, and of the proper modes of cultivating and preparing them for the table.

The generality of our country gardens exhibit but a sorry assortment of vegetable productions, and these are but badly cultivated, and of an inferior quality. The tendency of horticultural exhibitions is, to show the good and bad in contrast, or rather to promulgate a knowledge of the better sorts, of their culture and use. — To excite emulation, and to demonstrate the utility of good culture, as a source of health, pleasure, and profit. I have had many fruits presented to me, which the donors considered of the first quality; but which I found, on comparison, to be of a contrary, or inferior grade. The man who trusts on or trusts only in his own merits, may well mistake them for good ones. It is easier, to cultivate good fruits than bad ones; and no one can expect good fruits if he who cultivates them knows it. It is easier to cultivate the vegetable as it is the clove peg; the green gage as it is the horse plum; and yet the difference is twofold, in all the qualities which we most esteem, as incomparably great. But until we can show our neighbor better fruits, he will continue to cultivate and rest content with his choice pear and horse plum.

With regard to what is termed ornamental gardening, or the cultivation of flowering shrubs and plants, there is an objection, real or affected, often made by very many people, on the ground that it does not profit. If the great object of life was to accumulate money, without enjoying any of the comforts which it confers, give the gratification of animal appetites, the objection would be conclusive. But we are endowed with other and higher appetites than the mere brute; and Providence has every where surrounded us with suitable objects for their development, and innocent gratification. And I shall we repeat the professed benediction so kindly tendered for our benefit, because it adds nothing to our self? And what is there in the natural creation, better calculated to soften down the rough asperities of our nature, to awaken kind feelings towards each other, and excite reverence and love for the Most High, than a familiar acquaintance with the wonders and beauties of His vegetable kingdom? Did you ever know a misanthrope, or a miser, who was an admirer of flowers? I would not recommend the neglect of more important duties for the culture of a flower garden; yet when there is ability or leisure, and these may be found to a greater or less extent in almost every family, a taste for floral beauties should be inculcated in the young, not only as a source of rational pleasure, but as a salutary precaution against bad companions and bad habits. The mind must be employed, and must have recreation. It is better to direct it to the works of the Creator than to the works of man. Lord Bacon has said of the garden, "it affords the purest of human pleasure—the greatest refinement to the spirits of man—without which, buildings and palaces are but gross handicrafts."

Among the causes which have essentially contributed to the deterioration of our lands, and the consequent depression of our agriculture, I consider the following prominent:

1. *Ignorance of the principles of agriculture;*
The want of a sufficient outlay in the management of our farms; and

2. The low estimation in which the employment has been held by all classes, including farmers themselves.

Agriculture has too generally been considered a business requiring mere physical power, with which the principles of natural science had little or nothing to do. To plough, sow, and gather the crop, has been the general routine of farming operations, regardless of the poverty which our practice was inflicting upon the soil and upon our children. Like the reckless heir of wealth, we found ourselves in possession of a treasure; and without inquiring for what purpose it came into our hands, or realizing our obligations to husband and preserve it, for others, we have squandered it lavishly, through our ignorance or our folly. True, we have been occasionally admonished of our error by the schoolmen; who, wrapped in abstract science, and knowing little practically of its application to husbandry, have as often tended to confuse and mystify, as to enlighten and instruct. Hence the prejudice which has arisen against book farming. But science and art are now making their labor, and are deriving mutual aid from each other, on the farm, as they have for some time been doing in the manufactory and in the shop of the mechanic. A new era is dawning upon the vision of the farmer; a new light is illumining his path, and a new interest and new pleasures are urging him on to improvement. He begins to study the laws which Providence has ordained for the government of improved culture, and he begins in their application to his labors, the means of increasing profits and high intellectual enjoyment. And the more he studies and is guided by the laws, the more does he become satisfied of former errors, and of his comparative limited sphere of usefulness. Science is probably capable of render-

ing more important services to husbandry than to any other branch of labor, and presents a wider field of useful study to the cultivator of the soil, than to any other class of society.

The deficiency in farming capital, or rather the stagnancy with which capital is employed in improving and maintaining the condition of our lands, is another cause of declension in the profits and character of our agriculture. The farmer is too prone to invest his surplus in some new business, or in adding to his acres, instead of applying them to increase the profits of his labor and the products of his farm. He either works more land than he can work well and profitably, or he directs to other objects the means which would yield a better return if applied to the improvement of the farm. He is apt to consider twenty or thirty dollars an enormous and wasteful outlay upon an acre of land, or upon a choice animal; and yet the interest of this outlay will be ten times paid by the increase of the animal; and in most cases the principal also will be returned to him in the course of two or three years. Many of the most thriving farmers in southern New York, New Jersey, and Pennsylvania, make a quadrupled expenditure of twenty dollars or more to manure an acre; and it has become a maxim with them, that the more the outlay for manure, the greater the net profit of the land's. But it is not the outlay for manure alone, that demands a liberal expenditure of capital. Good stock, good farm stock, and good implements, are all essential to the economy of labor, and to neat and profitable farming. And I think it will appear from the case I have quoted, that in many localities, capital may be very advantageously employed in reclaiming wet and marshy grounds, generally rich and the most productive when laid dry.

When our cattle grow lean, and threaten to disappoint our hopes of profit, we do not hesitate to impute the evil to the want of food, or to inattention in the herd-man. And if we are prudent managers we at once graduate our stock to our food, knowing that one well fed animal is of more value in the market, than two animals that carry but skin and bones, and take care that the food is properly fed out. When our crops become lean, we need not hesitate to ascribe the decrease in product to like cause—want of food, or want of attention in the farmer; and prudence and profit in like manner require, that our crops, like our animals, should be limited to the food and labor which we have to bestow upon them. In other words, an acre well manured and well worked, will be found to be more profitable than four poor acres badly worked.

It may be here asked, from whence are to be obtained the vast supplies of manure requisite to manure our old lands? I answer, from a multiplicity of sources around us—from every animal and vegetable substance within our reach. Nothing that has once been part of an animal or vegetable, but can be converted into corn, grass, and roots. I think I may assume as facts, that upon an average, not half the manure is saved upon our farms that might be, and this moiety is half lost before it is applied to the soil. Every horse, ox, or cow, watered upon the farm, if well fed, and littered with the straw, stalks, &c., of the crop, should make from six to ten cords of good manure. Dr. Coventry, late professor of agriculture at Edinburgh, estimated that the straw of an ordinary acre of grain, computed at 21 cwt., may be converted by the urine and liquor of the stables and cattle yards, into three and a half tons of manure; that manure thus that cut one and a half tons of hay, will give four tons of manure, clover, the first year, six tons, and the second year, five and a half tons per acre; and that with the extraneous substances which may, with due care, be collected without expense from the roads, the ditches, the ponds, and from refuse of every kind about the houses and premises, the acceptable amount should be amply sufficient for a full supply of manure once during every course of the four years system of husbandry. Arthur Young, with six horses, four cows, and nine hogs, which consumed sixteen loads of hay and twenty-nine loads of straw, obtained 118 loads of manure, 36 bushels to each; and from 45 fattening oxen, well fed and lickered, 600 tons of rotten manure. But an American lawyer, and an excellent practical farmer withal, has gone beyond the common rates. I visited his farm a few weeks ago, which lies upon the sea shore. It consists of about 200 acres, most of which was in a course of crops. The crops of the season had all received an ample supply of manure, as their appearance indicated—and yet I was shown masses of well prepared compost, in the erva, consisting of yard manure, peat, a horse seaweed, and fish—estimated at twenty-five hundred loads—all produced upon his own farm.

The third obstacle to agricultural improvement which I propose to notice, is the subordinate rank to which this employment has been assigned, and to which the farmers themselves have contributed, by

of respect for themselves and respect for their voices. The wholesome habits of society have been broken up, by the civil and political convulsions of '63, and the moderate thirst for acquiring wealth fashionable consequence, through mercantile and speculation, that honest productive labor has been driven into the background, and confined not only ungentle but menial and servile. Yet care to lay down this proposition, that he who labors for the wants and comforts of himself and family renders some service to society at large, by mental and physical industry, performs one of the duties of life; and will ultimately be rewarded in precious rectitude of his life, by a greater measure of continual happiness than he who makes millions and speculation, to be squandered in extravagance or wasted in idleness, by his children or grandsons. The revolutions that are constantly taking place in families, sufficiently admonish us, that it is the result we leave to our children, but the industrial and moral habits in which we educate them, cures to their worldly prosperity, and the treatment of their conscience.

Farmers, I have remarked, share in the errors of the day. Not content with the gains which are everward of prudent in lusty, and which might be increased by the culture of the mind—nor content with one of the most independent conditions in so many of them and thousands of them seek other employments, and some of truly menial character, rid of labor, the greatest blessing of man, and to themselves in the imaginary scale of fashionable. And if they cannot participate themselves in imaginary greatness, (and it is seldom any thing but imaginary,) they are anxious to inflict the pain their posterity, to rear their sons to the pen and the office, to political power and to make them merchants, a useful but greatly neglected business, or to place them in some other employment, which shall exempt them from the labor, the salt that best preserves from corruption.

What class in society have within each so many of the elements of human enjoyment—so many facilities for dispensing benefits to one of the first duties and richest pleasures of the independent tiller of the soil? "The," says Franklin, "has no need of popular flattery: his crops depend only on the good of his honest industry. If directed on the improved principles of husbandry, they offer the certain means of acquiring wealth, and as is consistent with the pure enjoyment, or with the good order and prosperous condition. Agriculture is the golden mean, secure on the temptations of man's human opulence, and even sycophancy and dependence of poverty, neither poverty nor riches," was the prayer of a wise man of Scripture, "let," he added, "I and deny thee, and say, who is the Lord? or a poor and steal, and take the name of my God."

Value of Observation to the Farmer.

There is no man or class of men is the value of observation so great as to the farmer. His business is all with natural objects. His occupation leads to many things to imitate or follow nature. But nature are learned only by watching the successes and the silent operations which are going on thus ascertaining the causes which produce the which we see taking place around us. The who watches closest—who suffers no change to place without looking into the cause—who, in serves the most, and treasures up the most in memory, becomes most acquainted with the laws spoken of, and by consequence is the best farmer. The observations which have been made recorded by others, have become a large fund of information, there is yet a vast deal more to be learned.

Facts are yet in the dark which can only be clearly observed. It would be interesting to have a history of many of the useful improvements that have been made from observations, which first gave the hint to set the men on foot. Mrs. Child gives a pleasing statement of the value of observation in one instance.—A not fifty miles from Boston, says she, is quite the best for the improvement he has made in the wild vine. He found a vine in the wood which dozens of neighbors passed every week, as well as he; but he had that where the oxen fed upon the vine the were sweetest. He took the hint. The vine was planted and closely pruned. This produced the effect as browsing had done; the nourishment in a wild state supported a great weight of vines and drills, went saucily to the body of the grape.—

His neighbors would have known this as well as he, if they had thought about it; but they did not observe.

It is by thus observing that we are enabled to gather experience, and experience guides to future success.—The observations that have been made in regard to the grain-worm, or *worm*, as the insect is sometimes called, led many farmers to sow their wheat late. By so doing they have saved their crops. It has been observed that the insect came out at a certain time in the summer and remained active a certain number of days. Hence, by sowing the wheat later so that it would not be headed out, it would escape the ravages of the insect in question. This has succeeded well with most farmers.

A farmer who will probably have 500 bushels of good wheat, told us, the other day, that had he sowed it ten days earlier, as he is inclined to do, he would have lost the whole. But, being informed of the observations that had been made in regard to the worm, and advised to sow, and precautions for ten days, he complied, and thus saved his crop.—N. E. Farmer.

From the New England Farmer.

CARROTS AND RUTA BAGA.

The product of these crops is not so large in this State as to require much expense or pains in their preservation. An acre of ruta baga or carrots is, upon the whole, a large quantity for any one farm.—As yet, our farmers, in the cultivation of roots for stock, are slowly feeling their way. We hope they will come right at last; and that small experiments will encourage them to extend the cultivation. They will presently learn that for keeping stock, there are many much more profitable crops than English hay at a ton or a ton and a half to an acre; and by turning their attention to other crops, by which they will have it in their power to keep much more stock, they will increase their manure heaps, and in this way quadruple, in some cases increase ten-fold, the productiveness of the farm.

An acre in carrots may be easily made to yield six hundred bushels. In the estimate of an experienced and excellent farmer in Berkshire county, half carrots and half oats are as good feed for a horse as all oats; or rather to use his own expression, he would prefer one hundred bushels of carrots and one hundred bushels of oats to two hundred bushels of oats for his horses. The experience of a distinguished farmer in England, in the practice of keeping eighty horses on his farm, and in his colliery, only confirms this statement. Now a bushel of carrots a day with chopped straw or salt hay, would, we have no doubt, keep a work horse in high condition, though it would probably be much better in the case to give him in lieu of so many carrots, some grain or meal. Half a bushel of carrots per day, however, at twenty-five cents per bushel, cut off from the allowance made above, would pay for an allowance of a peck of oats per day to a horse.—Upon the supposition then, of his being kept in the stable six months or one hundred and eighty-three days in a season, an acre of carrots would yield six hundred bushels to the acre, supposing one bushel to be sold at twenty-five cents per bushel, and the money expended in oats at thirty-seven and a half cents per bushel, to eat with the carrots, would considerably more than furnish three horses with half a bushel of carrots each per day, and two bushels of oats per week, or more than a peck of oats per day besides the half bushel of carrots. Under this feed a horse would require very little long feed of any kind to keep him in good condition.

Now, on the other hand, suppose the horse has English hay, and if he is worked he ought to have as many oats as in the former case, besides, one horse will consume in that time, at twenty-five pounds per day, not less than two tons and a quarter, or the three, six tons and three quarters; and this can hardly be obtained from less than seven acres of land of ordinary yield. The horses will not, in the next place, be by any means in so good condition; and the manure made from this feed not half the value as that made in the other case.

This is, many will say, a remarkable statement, but it is well founded and not at all exaggerated. In other respects it deserves particular consideration. There cannot be a doubt of the advantages, to our animals, in respect to health and comfort, which the use of succulent vegetables in some proportions, would have over the dry feed, which we are accustomed in our present mode of keeping to give them in the winter season.

We might go on to speak of the green vegetables for stock in winter; the sugar beet, the ruta baga, the parsnip, &c. &c., but it does not come within our design to treat this subject more fully at this time.

Our intention now, was merely to speak of the mode of preserving these vegetables through the winter. We say then distinctly and emphatically, that

neither ruta baga, nor turnips, nor cabbage, should ever, under any circumstances, be put in any considerable quantities in the house cellar. The least decay produces an offensive odor, and poisons the air of the cellar and of the house. Carrots and beet are by no means so bad, but they, if placed in large heaps, are liable to become heated, and to decay; or, otherwise to sprout, when their nutritive powers are of course lessened.

We have kept them well in several cases, and often known them kept well by others, by putting them in a field, thus: Take a dry knoll near where they were raised, dig a trench about a foot deep, lengthwise north and south; and of such width as you choose, and then alter the tops of your carrots and ruta baga are cut off, put them into this trench, piling them up as high as they will lay, in the form of a house roof—do this when they are dry; then put in a light layer of straw and cover it lightly with dirt, piercing some holes in the top of the heap with a crow bar, to let off the steam; and so let them remain until the severe frosts are about setting in; then put on another covering of straw and a thick covering of earth, fastening up the south end with several bundles of straw, which can be removed at pleasure. They may be put up in heaps of one, two or three hundred bushels, or more, as may be desired. They will keep well in this way, and in pleasant days they may be got at without inconvenience at any time as you may want them for your live stock. You must be careful to see that there is an escape for the steam after they are first put up, otherwise they may decay before without your suspicion, and very much to your chagrin. H. C.

From the Cultivator.

Causes of Seeds not Germinating.

We have known and heard of considerable loss and disappointment from seed, particularly onion seeds, not growing. We have thought and inquired in reference to the cause, and the result of our cogitations and enquiries may be thus stated:

Without a certain degree of moisture, seeds will not germinate. On dry, sandy soils, and in a dry season, it seems highly probable, then, that seeds may be deprived of the requisite degree of moisture; perhaps receiving just as much as will mould them and destroy their vitality, or being so near the surface as to be injured by the sun's heat and light.

But the seeds may have germinated, and have commenced to send out their roots and stem stalks, and yet be destroyed. If the soil is not pressed closely to the seed, and very dry weather occurs just at this period of the process of germination, the root being too distant from the soil, and too feeble to draw any supply of moisture, the liquid food of the plant contained in the fermented seed may be dried up, and the life thus destroyed.

If you would avoid disappointment and loss from seeds failing to grow, the preventive process is indicated by a knowledge of the cause most frequently productive of this result, which we think are those stated above. If you sprout your seeds before putting them into the ground, you will preserve them from the first cause of failure, but if you pulverize your soil thoroughly and press in this state with a hoe, spade, or roller, upon the seeds thus sown, the root stem will soon and surely derive sufficient moisture from the soil.

In a few instances I have found my neighbors blaming the seeds as useless, particularly of onions, carrots, and parsnips, when I have obtained a little of the seed and found it to sprout quite well. You may easily save your selves from such reflections, or from the temptation to blame others, by steeping the suspected seed in warm or tepid water, from six to twenty-four hours, according to the size and hardness of the seeds, and then sowing it away in a warm place for a day or two.—If good it will sprout in this time; if kept warm in a darkish place, and it does not sprout in this time, the seed is faulty.

In connexion with this subject, I may state that several circumstances incline me to the belief that corn which has been sprouted—no matter in what steep—is safe from the ravages of the red or wire worm. It has been fashionable to steep in a strong solution of copperas, and to create the safety of the seed in this state, not to the change which fermentation has produced in the germ or chut which is usually first attacked, but to the change in the taste from the copperas. We have known corn soaked in a simple water—in water alone—to escape from the attacks of the worm as well as that soaked in a copperas steep. Until this matter is made more certain, however, I would hold it bad husbandry to neglect the copperas, as, in addition to the change produced by heat and moisture, we have also the disagreeable taste communicated by the seed.

The following communication was written for the late "Genesee Farmer," and Mr. Tucker kindly published it in his weekly paper, (which had only a small circulation,) but refused to place in the monthly, although he inserted the article from Mr. Thorburn, of which we complain. As it is a matter which affects our reputation, and that of our establishment, justice to ourselves demands its publication in this paper. And let our friend Thorburn should complain of injustice, we also insert his communication referred to.

CHINA TREE CORN:

And the "Rochester Seed Store."

Mr. Tucker—Since my return from England, I have been looking over the Agricultural papers received during my absence, and observed numerous articles on the subject of Thorburn's celebrated China Tree Corn, in most of which condemn it as an "imposition," "humbug," &c. Many of the writers obtained their seed directly from Mr. Thorburn, and of course must look to him for any explanation they may require. But others obtained it through different channels, and seem inclined to suspect them of selling a spurious article for the sake of gain.

In your paper of the 7th of October, is a communication from Syracuse, signed W., and headed "Gross Imposition." The writer, after stating that he was induced to try the corn from reading Grant Thorburn's glowing account of it, complains that it did not answer the description, and prove inferior to our common varieties. He then adds:

"We look upon the matter in this section, as a gross fraud practiced upon the public for the sake of gain. The column at this time is principally attached to Mr. Thorburn, inasmuch as he has the credit of furnishing all the seed; some of which, I am informed, came directly from his store in New-York; most of it, however, that was planted in this vicinity, came thro' the 'Rochester Seed Store,' but was said to be genuine seed from Thorburn's. We look for a satisfactory explanation."

In the Farmer of November 9th, is a reply to W. from Grant Thorburn himself. But, to me, it is far from being a "satisfactory explanation." He says, he "thinks W. has not got the true kind," and then adds, "the seed sold by his sons in New-York, Albany and St. Louis, was genuine." I am afraid old friend Laurie is becoming rather uncharitable of late, and since he is so free with his insinuations, I shall have to "unfold a tale" which, I fear, will render his defence of but little service to him.

Soon after Mr. Thorburn published his wonderful corn story last fall, I began to have numerous inquiries after the seed. Accordingly, on visiting New-York in October, I purchased of Mr. G. C. Thorburn a quantity of the corn, and was informed that his supply was limited and selling rapidly. Soon after reaching home, this lot was all disposed of, and I sent to Mr. Thorburn and obtained an additional supply. This was all sold during the winter, and as the spring approached, the demand seemed to increase. By this time, I expected to hear that Mr. Thorburn's stock was entirely exhausted, as he had stated that he only raised a small patch of about 200 hills; but to my surprise, I was informed that his supply was still adequate to the demand, although orders poured in upon him from every quarter. O, rare Laurie Todd! thought I, your corn is certainly "something new under our sun," and well did you name it "Prolific." For it seems to possess the marvellous properties of the ancient Widow's oil—the more you draw from it, the more there is left. Being rather skeptical on the subject of modern miracles, I determined to inquire into the mystery. I then learned that the wonderful "new variety" was an old acquaintance among the farmers of Long Island, several of whom had cultivated it for a number of years, and were then selling their crops to Mr. Thorburn, to supply the immense demand which he had occasioned.

Supposing I had contributed my share towards the nameless "charitable institutions," I now purchased a further supply of seed from Mr. G. R. Garretson, of Flushing, which I have the fullest proof was the same in every respect as was sold by Mr. Thorburn. All that was had or sold at the Rochester Seed Store, were the two lots from Mr. Thorburn and one from Mr. Garretson.

The following letter was lately received from Mr. Garretson in relation to the seed from him:

Flushing, L. I., Nov. 5th, 1839.

Mr. M. B. BATHAM—

Dear Sir: In answer to your inquiries about the China Tree Corn, which I sold you last spring, I

would state, that it was produced in the same way as advertised and sold by Mr. T. in, under the name of "China Tree Corn." It was raised by Mr. J. Van Meters, of Flushing. Mr. Thorburn made it one of the principal items, and I, Mr. T. in, made it one of the specialties that sold you.

Yours, &c. G. R. GARRETSON.

Owing to some unfortunate error, I myself had some doubts of the genuineness of the corn to this northern climate, and I was recommended by my customers, and more than that, to return to Thorburn's, as a security of seed, and let it be taken on his responsibility. My persons may rest assured that I shall always be ready to sell and favor "an infallible explanation" of my doubts affecting the reputation of the Rochester Seed Store. To ask of a seedman is generally a thankless as well as a difficult and responsible one. And well I do not mean to thank from any blunders or ignorance which justly belong to me, I cannot consent to become responsible for the statements of every peddling "new variety" monger, who may have a full pouch of corn or potatoes to dispose of, inasmuch as the products to be given to charitable institutions.

M. B. BATHAM.

Rochester S. T. Store, Nov. 25, 1839.

P. S. I am frequently asked, what "charitable institutions" receive the donation promised by Mr. Thorburn; and some persons actually suspect that he pocketed the fund. But any one at all acquainted with the unimpeachable character of Grant Thorburn, would consider that to be an impossibility. The only reason I can give for the non-appearance of any public acknowledgment, is, that it would be offensive to the modesty of the donor, who doubtless wishes to "let his alms be done in secret." Still, as this money was made up of contributions from many who do not think they received an equivalent in return; justice to their feelings renders it necessary and proper that the receipt of the donation should be publicly acknowledged.

From the Genesee Farmer.

Astoria, L. I. (late Bate's Cove, Oct. 21, 1839).

Mr. Tucker—In your Monthly Farmer for October, page 145, is a piece signed W. He begins with *Gross Imposition*, and then gives my description of the corn. Now, Mr. W., if you will substitute 10th of August, in place of the 19th of July, I assure you in the words of truth and soberness, that every word in that description is plain truth. Different climate, bad soil, or spurious seed, might have been Mr. W.'s misfortune. Because a man, born blind, says the sun don't shine on the 4th of July, this will not persuade us out of our senses.

Mr. Tucker, this thing was not done in a corner. In 1838, scores of my neighbors saw my corn when growing; this summer, hundreds visited my field; in the office of the Journal of Commerce, Commercial Advertiser, Daily Whig, and at No. 11 John-street, New-York, and I believe, at William Thorburn's Seed-store, in Albany, may be seen stalks of the corn; having ears growing on the tip end of the branches, as they stood in the ground. If Mr. W. or any of his neighbors come to Albany or New-York this fall, they ought to call and see for themselves. There has been no *undue* or *double dealing* on my part in this matter. I put my name to every communication I made on the subject. I said it is an *extra corn*, and I say so still. We have earlier kinds, to be sure, but they are small. This season I planted on the 12th of May, and on the 22d of September my Chinese corn was dry and *gathered in the crib*. Mr. W. says it will not ripen with him. I think he has not got the true kind. There is a difference from quaters; in some cases it is not entirely, in some it turned out better than my own. I will give you the following, from many I received of the same import:

Orange, Tiotha co., N. Y. Oct. 10, 1839.

Friend Thorburns—I am very happy to say to you, that my grand son, (named for me by your son,) has raised from your *China corn*, this season, the finest crop I ever saw of *China corn*; all two and five ears, and the crop will be at the rate of more than 100 bushels to the acre.

Very respectfully, your friend and servant,

GEORGE I. PURDIE.

Now, Mr. Tucker, I am a stranger to Mr. P., or rather he is a stranger to me, as I never knew there was such a man in the world, till I received the above letter. I am not sure, at the moment, where Oswego lies, but I should think the corn that ripens at Oswego, would not be late for Rochester. I know the Chinese corn sold by my sons in New-York, Albany, and St. Louis, was genuine. After my crop was sold last year, they obtained a supply from Samuel Par-

sons, of Flushing, L. I. This season I planted a row of his corn along side of my own; they yielded in all respects. In 1838, I planted only a two hundred hills, producing six or seven hundred ears; this season I planted a small field; when I ploughed, it was blown down in a storm of wind soon, with the exception of ten or twelve hills, was then too high, and being heavy with a heavy rain, notwithstanding, I gathered upward ninety bushels from the acre.

Without all contradiction, Mr. Tucker, this is a public corn, and will take the lead of all other so called middle states, at any rate. Perhaps it may ripen in the northern parts; but I planted the D on the same field, on the same day; the Chinese only a week later in being. The Editor of the F. V. (O.) Telegraph, says he has cultivated a patch of Thorburn's Chinese corn this season—the "yield more than large, sound, ripe ears, for every bushel."

I will only observe, in conclusion, that I do think the Agricultural Journals, Registers, and papers, have (in general) dealt with this same while the accounts are as opposite as light and night; they have published the dark, without throwing any light on the subject. I refer not to you, Mr. P. for this number, now in hand, as the only one I seen in six months. As your correspondent requests an explanation, I doubt not but you will give place in your Farmer.

Yours, respectfully,

GRANT THORBURN

HATCHING EGGS BY STEAM—THE DON CHICKEN MANUFACTORY.

What will not the inventive genius of man accomplish by the use of steam? Who can estimate amount, or enumerate the kinds of labor, which kee ingenuity has made this agent perform? Country is famous for its Steam-boats, Steam Steam-guns and Steam-doctors, but who, in the vernal Yankee nation, ever thought of a *chicken manufactory*? Yes, hatching eggs by steam, and that, too, not only as an experiment to satiate curiosity, but as a regular and profitable business.

This novel exhibition we lately witnessed in London; and of all the strange sights of that city, it was that interested us as much as this. We intend to write a description of the scene ourselves, but in the following more particular account of *Chambers's Journal*, we publish it in prefer our own:

EGG-HATCHING EXHIBIT.

A short time ago, while in London, I went among other "sights," the much-talked-hatching apparatus, or, as it is called by its proprietor, *the incubator*—a word from the Greek, meaning to bring to life. The establishment is situated Pall-Mall, opposite the Italian Opera-House, consists of a large handsome back apartment, by a passage from the street.—The first floor entering the room is that of rather a warm place, along with the slight smell of a poultry which the place literally is. On one side, only, is a large oblong case against the wall, elevated four feet from the floor, and used as a hatchin on the opposite side, running nearly the length of the room, is an enclosure formed of paling, separated distinctly by rows for different sizes of birds, running close to the wall, a row of coops or huts for the little creatures to run into. At the farther end of the room is a glass case on a table, in which the of one day old are kept and nursed; and in the centre of the room is a table with a number of instruments toward maturity, but which being care of course useless for hatching; they only the progress of the chick. Such is the general of the establishment, which is fitted up with steam-pipes running round the room to preserve a uniform temperature; and with a man, who attends the oven, and a woman to look after the poultry enclosure, the whole is to be before the eye of the visitor.

The first thing we do is to take a peep into the when the process of incubation is performed. The oven executes the office of the parent hen, and in a remarkable perfect manner; in fact, much better most hens could perform the operation.—Every body who has any thing to do with hatching poultry, and that the great difficulty consists in keeping the upon her eggs. Some hens are better hatch

From the Farmer's Register.

Application of the Principles of the Rotation of Crops.

There is scarcely any condition of agriculture, in the less degree advanced, or improved in operation, which is not based on some false system of rotation, or succession of crops in a certain order. It has long been known and almost universally acted upon, that, as to grain crops at least, the same kind could not be produced successively on the same land, with a rapid decline of product, from some other cause or cause besides the mere lessening of the fertility of the land. For when land so treated and so reduced in product was put under some other crop, the product of such other crop was greatly better. Therefore, except in the earliest and rude cultivation of a new country, no where is there to be found cultivated the same grain crop for many years in succession, without the interposition of some other crop, of other grain or of grass. Cotton is the only tilled large crop, in this country which has not been alternated with other cultivation, and which is tenanted for years together on the same land. This practice is recommended by the clean condition of the land procured by that crop, and when its repeated culture secures. But it may well be doubted whether the diseases and enormous losses of product in this crop, are not to be ascribed to its being continued so long on the same land.

But though every farmer uses something of a rotation, still the most usual courses of crops are very imperfect and highly objectionable; and there is scarcely any scheme of rotation which does not offend greatly, in some of its features, against the correct principles of the rotation.

The fact of the certain and rapid decline of product of any one crop repeated year after year on the land, was universally conceded, and the practice generally abandoned, by practical cultivators, without their troubling the selves to investigate the causes. Theoretical and speculative agriculturists have entertained different views at different times, and each has had its reign. Formerly it was supposed, and generally admitted, that each plant drew from the soil some food peculiar to itself, and thus rapidly exhausted the soil of this its own peculiar nutriment, while there still remained unextracted, and in abundance, the food to support plants of other kinds. But though this theory passed current long, without dispute, because it served to explain the effects produced, it was gradually weakened, and finally overthrown, by later and more correct views of the nature of the food of plants. It is but within the last few years that a new and opposite doctrine has been started, which is at least the most in fashion at present, if not the most generally received. This is founded on the doctrines of Mearns, De Candoia, and Powers, of the excretions of plants by their roots; and the inference thence drawn that the rejected excrement is fit to serve as food for other plants, but is useless, if not absolutely harmful to the kind from which it was thrown off. And hence also would follow the necessity for a change of crops.

Without denying or overlooking either of these doctrines, I will yet call for whatever may be the main cause which calls for a frequent change of crops, another cause, of at least very considerable operation, and which has been already named in the first of the two numbers. This is, that every plant is supposed to be propelled on by its own peculiar and exclusive, which are excretions to be supplied by their proper food, and freed by the soil from any encumbrances of the field, and therefore are injured or even ruined, in an absolute and in their destructive ravages, as if by the crop which fed them, and their excretions, which, if they were left in, remain unchanged, and by their own excrement to be destroyed or gradually to be exhausted, and powers of mischief, by a total exhaustion of the power and of the treatment and cultivation of the field. Perhaps these dogmatists may be reasonable, from their minute views, and yet so many reasons to cause any extent of injury that is found to be suffered by continuing a tillage of any one crop, and which is occasioned by our veritable husbandry or a rotation of crops.

But hardly, though the causes of such evils may be uncertain, the effects and their avoidance not therefore unknown. And the observation on both scientific and practical agriculturists have seemed to us such that what they have termed the principles of the rotation of crops, which furnish a body of rules, by which to test every particular scheme, and to show its advantages and defects. But though most of these principles and the rules founded on them, are universally received, still perhaps every writer and reasoner upon rotations differs in some important respect from all others, and by my own views, and still more the rules and applications founded thereon, which have been and will be offered in these numbers, have no authority, either in

previous precedents or examples of practice. The adoption of the above named and new reason for a rotation of crops, would alone require the introduction of new rules in determining a proper and reasonable, and not considerable departure from the standard system, by the adoption of a new system of rotation. But in such the principles and rules laid out by every one, and a well informed agriculturist may have differed in some respect from the majority, and even if all were wrong as to the main cause, or the necessity of changing crops, still all were right in the means, and in a general principle and rules of good management.

But, though many a scientific writer has laid down the principles of proper successions of crops, and all more or less particular in writing, or in practice, have advanced particular rotations, still scarcely any two agree fully in their rules, and agreement in practice seems more the result of old custom and neighborhood example, than of thinking and reasoning. It is manifest that no particular course of crops can be prescribed as the best for an extensive agricultural region, nor for fields of different soil on the same farm, nor for the different conditions and times, or even the same field. It is as much quackery to direct the same rotation for an extensive region, as it is to prescribe the same medicine for all diseases. When we hear of a particular rotation (no matter what) being generally pursued throughout a large district, it is pretty good evidence that the rule is pursued from custom, and not by reason. Some of our best farmers have no regular rotation, though always aiming to observe the sound principles of the succession of crops, by varying the succession, according to the changes of circumstances.

But if neither reason nor precedent can point out always a right or perfect rotation, it is easy enough to learn from both what is wrong and injurious. And we can scarcely find any regular rotation in this country, which does not offend against some admitted principle and rule, and the most common have scarcely one redeeming quality, no matter by what set of principles the practice be tried.

The most important and indeed indispensable requisite of any good scheme of rotation, or course of crops, I take to be the following; and the observance of them may be termed the three primary rules for rotations. 1st. That the several crops which form the course, are among the most profitable to the cultivator, in the circumstances in which he is placed, of climate, soil, and market. 2nd. That the whole course of crops, taken through, is profitable to the land—serving to increase its productiveness, if poor—and at least retaining its productiveness, if already rich. 3rd. That each crop in the rotation serves to prepare for and aid the cultivation and production of the next, which is to follow it, instead of obstructing either or both.

The first two of these requisites, either expressly or by implication, may be considered as embraced in every theoretical scheme of rotation, and aimed (however ineffectually) to be preserved in every judicious farmer's practice. The third is almost disregarded by all, and is certainly not by any placed in the important position, or viewed in the light which I think it deserves.

If all these three requisites be secured, any rotation will be good; if any be neglected, or be but imperfectly secured, the rotation will certainly be a bad one. The best wisdom and care for the improvement of the land and its produce, and for the tillage, would be manifestly, if any of the crops were of such kind as to be beneficial, common, or otherwise profitably used, by the farmer. Next would it be prudent and sound policy, if any other rotation, if it worked to support the farm. And even if the land of crops were to be the most profitable, and the improvement of fertility, fertility advanced, what will it profit the proprietor, if the rotation operates to produce weeds and depredating insects in such numbers as to greatly to impede his labor, and so to diminish the product?

Several agriculturalists have laid down so many principles or rules, to be observed in pursuing rotations, that it is impossible in practice to observe all, or perhaps half of them. Thus the English writers insist, perhaps more strongly than on any other point, that green (or grass) and roots, or leguminous crops, and white (or grain) crops should regularly be alternated. Others, that root-crop plants should alternate with fibrous and shallow root. But all these are minor considerations compared to the foregoing; and each or all of them might come in conflict, in the circumstances of this country, with one or more of the more important and indispensable requisites.

A man has been placed in the Asylum for the insane, in Philadelphia, because he was caught picking a printer's pocket.

The busy man, say the Turks, is troubled with one devil; but the idle man is troubled with a thousand.

Benefits of Root Cultivation.

The culture of root crops for the rearing of swine and for winter feeding of cattle I believe to be a good object to most farmers. The mangold wintzel, the garlick, the common beet, the carrot and perhaps parsnip may be raised on ground that will produce good crops of corn; the ruta baga may be raised on a richer soil and with less manure than the other crops. In proportion to the quantity produced with the labor, I am inclined to give the preference to the ruta baga. That crop may be raised with about as much labor as a crop of potatoes upon the same ground. The season for sowing, six and eight hundred bushels sometimes a bushel to the acre are produced a thousand bushels weighing twenty-five tons, cut out to a stock of cattle, will be equal in value to ten tons of the best hay. It is a mistake to suppose that the ruta baga spoils either the meat or milk of the creature fed upon it. This mistake of course is the fact familiar to many practical farmers that the turning of fat cattle and cows into fresh where turnips, cabbages, and onions have been raised and cleared out, leaving tops and leaves, will not them liable when slaughtered or milked, to leave meat or the milk tainted with the taste and flavor the articles upon which they have fed.

Milch cows fed daily on ruta baga once a day, communicate no taste to the milk; and if there be doubt about fat cattle, the leaving off the ruta baga week and substituting corn or other feed, will find their meat in as good flavor and quality as if they fed exclusively on corn. I prefer late sowing of ruta baga, say as late as the 10th of June, to an earlier sowing, as grows best in cool weather, and by late sowing it much better escapes the turnip fly and destructive grubs, and has the advantage of a vigorous growth in the fall until severe frosts shall render it imprudent to gather them. Beets of the various kinds and carrots, to such as do not admire ruta baga, will be made well to supply their place. Fed with winter milked cows may be made to give double quantity of that most necessary and most grateful article in the consumption of every family, that the give when fed simply on the best English hay. The general cultivation of roots, my present conviction is that the quantity of beef and pork and butter and cheese produced in New England, may be increased one half, and might be very easily doubled.—Hill's Address at Keene.

HEALTH--REGULATION OF DIET

Many shut themselves up entirely in unpleasant weather, during the long winter, or whenever find a pressure of business within or unpleasant weather without; and yet they eat just as voraciously as they took exercise every day. To say that no attention is to be paid to diet, is madness. You must attend to it sooner or later. If you are faithful to regular vigorous exercise every day in open air, then you may eat, and pay less attention to quantity and quality. But if you take but little exercise, you may be sure that you are to be a severe sufferer; do not take food in the same proportion. I do not ask you to diet, that is, to be as difficult, as changeable, and as whimsical as possible, as a great point were to see how much you could do to yourself and others; but I do ask you to beware of the quantity of food which you hurry into your stomach each day, without giving it any rest; the quantity rather than the kinds of food, to do to your sedentary persons; though it is true that more simple food the better. If you are unimpaired this week, if it storms to-day, so that in periods, you cannot go out and take exercise, your diet be very sparing, though the temptation otherwise be very strong. When by any means you have been injured by your food, have overstepped proper limits as to eating, I have found in such cases that the most perfect way to recover, is to abstain entirely from food for three or six meals. By this the stomach will be free, and the system restored, to seek the hint from seeing an idiot who sometimes turns of being unwell; at such times he abstains entirely from food for three days, in which time he recovered himself, and he was well. This will frequently, and perhaps generally, answer instead of medicine, and it is every way more pleasant. The most distinguished physicians have ever recommended this course. It is a part of the Mahomedan and Jewish system of religion, that the body should be restored by frequent fastings. "Let a bull-dog be fed in infancy upon pap, Naples hussinet and boiled sheep head let them be wrapped in flannel at night, sleep on feather bed, and ride out in a coach for an airing and if his posterity do not become short lived, and void of manhood, it will be a wonder.—Todd's Standard Manual.

From the Yankee Farmer.

Cost of raising Sugar Beets and other Roots.

In examining an estimate of the expenses of making beet sugar in this country, many farmers will consider that the expenses of raising the roots is reckoned too low; this is owing to the little attention that has been paid to root crops; and to farmers, in general, not being made acquainted with the best and most economical method of culture, and not having machines and implements to enable them to manage the growing of root crops to advantage.

These unfavorable opinions will in a measure continue, till root culture is more in practice, for, though cases are stated of crops raised at a small expense, they will be regarded as extraordinary cases, and estimates made on paper, in which no error can be pointed out, will be looked upon as something uncertain; yet these favorable accounts will lead the enterprising and intelligent to try whether these things are so, and although their expectations may not always be realized, yet they will find a great advantage in attending to root culture, and be led to inquire into the most frugal method of pursuing it. Farmers who dig up a small patch and sow it in beets, and do not weed it till there are five hundred weeds to one plant, may find that the cost of raising a bushel of beets is one dollar, when, with prudent management in raising on a large scale, ten or twelve bushels could be raised with this expense.

In raising beets and some other crops in a garden, we have managed to do the weeding before sowing, and find that it is a great saving of labor; that is, pursue that manner of culture that will destroy the weeds before the seed is sown; and the same plan may be followed in field culture, and even to a greater advantage, as most of the labor can be done by animal labor, which is much cheaper than manual labor in this country, and this, as has been observed in the articles lately published on the subject, will enable us to raise beets as cheap as they are raised in France.

Our method has been to put on the manure and stir up the ground in the fall or early in the spring—the former is preferable, as the frost will loosen the soil and make it mellow, and the weeds will start in the spring before the soil is dry enough to work; when the weeds were well started, we worked the ground over again. About the 20th of May the ground was well worked over, and the seed sown, after being soaked, so that it would come up in a short time; the plants were up and large enough to hoe when scarcely any weeds appeared, the hoeing was done in a short time, the soil being very light and mellow, and there was but very little trouble on account of weeds, though the season, they having been mostly destroyed before sowing. If this plan should be pursued in field culture, it would save nearly one half of the expense. One hour's work with a horse and cultivator, in stirring the earth and destroying weeds before sowing, would save several days in hoeing.

The following method of culture for a field crop, would be very economical as to weeding, which seems to be the most expensive part of cultivation. A piece of land, a deep, mellow soil, that has been well manured and planted one year in corn or potatoes, would be in good condition for a beet crop. If it has been ploughed more than one year, there would be danger from the grub worm, which we believe is the cause of injury from insects to which the sugar beet is liable.

A piece should be selected that can be ploughed deep, and the stones, if any, removed. If there has not been sufficient manure applied to the previous crop, apply the manure and plough the ground very deep in the fall, if it cannot be done at this season, then as early as possible in the spring. When the work has started, go over it with a cultivator, and in a few weeks go over it again in the same way; this will loosen and pulverize the soil and destroy the weeds.

From the 20th of May to the 1st of June, let the earth be thoroughly stirred with a cultivator, or if the soil be not very loose it may be well to plough again and then go over it with a light harrow to make the surface level and smooth, and the soil fine; be ready to sow as soon as the ground is prepared, while the surface is moist, and that the plants may get the start of the weeds. Four water as hot as can be borne by the hand on the soil, and let it soak a day and a half or two days, then it will vegetate and be up, and the plants will be large enough to hoe before the few weeds that are liable to grow, get up so as to be much trouble.

Sow the seed with a machine and the expense will be light. Let the rows be from two to two and a half feet apart, then a light cultivator may be used between the rows; in thinning the plants, let them stand about one foot apart. If any places are vacant from the seed not growing or the grub worms eating them, the deficiency may be supplied by transplanting; though

transplanted beets do not form so handsome a root, yet they yield about as much as the other. The expense of weeding and loosening the soil will not be great. In hoeing, if the beets cannot be pulled easily, a harrow may be ploughed near each row with a horse plough, then they may be pulled with little labor. By this, or some better way, if it can be devised, beets may be raised at a small expense, and so much manual labor are cheaper here than in France, and so much labor can be done here by animal, which is performed there by the hands, we think our advantages are equal to those of France in the cheapness of manual labor. But supposing our soil, and ages in raising the beets are not equal to a cheap production, we have reckoned the expense higher in the calculations we have published, so as to conform to a fair estimate on all expenses. Instead of \$3.20 per ton, as in France, we have reckoned at \$5 per ton. No calculation on the expense of raising beets or other crops, can be made exactly suited to all parts of the country, as the prices of labor and fuel are different. Near cities and large towns, and near the seaboard, owing to good advantages for markets and communication, lands are higher, and the rent of them more, of course, than in the interior; in such cases labor too is usually somewhat higher.

Estimated Expense of an Acre of Sugar Beets.

Table with 2 columns: Item and Cost. Items include Ploughing, Cultivating, Harrowing, Sowing, First hoeing, Second hoeing, Hoeing again, and Harvesting. Total cost is \$19.00.

Make the rows 2 feet 4 inches apart, and then a cultivator can be used in hoeing. If the beets stand one foot apart in the rows, and weigh 1-1 1/2 lbs. each, the yield will be 20 tons. A rough ground at that distance, a great number will weigh 4 or 5 lbs. each, twenty tons is a good crop, but not extremely large, for in some cases 25 or 30 tons to the acre have been raised in this country. At the above expense of \$19 to the acre with a yield of 20 tons, the cost would be \$2 per ton. We make this estimate to show how cheaply it may be raised in favorable circumstances, such as good land at a fair price, convenient machinery and implements, and the most prudent management in the culture, with labor at a moderate price, and a favorable season. We have no doubt that in some parts of New England beets could be produced in great abundance at the above price; but we must not always expect a combination of favorable circumstances.

Suggest we reckon the produce only two thirds as much as above, say 13-13 tons, and the cost \$21-2 per ton in above, which will be \$23-33 cents; then the cost of the beets will be only \$1 per ton, or a fifth less than Mr. Barrow's and in his calculation on the cost of beet sugar. If we reckon 50 pounds to the bushel, 13-1/2 tons per acre would be only 53 bushels, which would be no more than a middling crop, not half as much as has been raised in a number of cases that have been named.

From the New England Farmer.

Agricultural Improvements in Europe.

Agriculture in Europe is now receiving an attention which it has never received in any preceding time. The four or five millions of people among the great nations, who for so many years, we had almost considered as barbarians, had now to think of themselves as civilized and military glory has been in the highest and the most valuable to the extension of the common and practical arts of life, and of agriculture in a special manner, as the great art involving and depending on the aid of all others. Implements of husbandry have been substituted for weapons of war; and fields that have been watered by the blood and whitened with the bones of slaughtered thousands, are now seen glistening and waving with golden harvests.

In England, great as the improvements were before that time, yet within the last fifteen years, it is confidently stated, that by an improved cultivation, the agricultural products have increased at least twenty-five per cent. in many parts of that country; that is to say, the amount of crop on the same extent of land is greatly increased, and the expenses of cultivation

either not increased, or diminished; or, to state in a form perhaps more intelligible, the profits of agriculture are advanced one-quarter by improved cultivation.

The same results are appearing in France. In England the introduction of the turnip husbandry produced the most extraordinary results; and of a permanent character. It enabled the farmers to keep much more stock than could be kept on dry hay and straw, and to keep a superior stock and in much better condition. It enabled them to enrich their lands very greatly by feeding off the turnips on the ground on which they were grown, and served to increase their manure heaps at the barn, when the turnips were fed to the cattle in the yard. The careful cultivation which good crops of this root demanded, made a fine preparation for wheat or oats or barley; and thus every thing went forward by a joint and reciprocal operation. In many of the counties of England the turnip cultivation has been the foundation of their improved husbandry; has changed the whole aspect of things; more than trebled or quadrupled in many cases the value of estates, as appears by their increased rental, and by the grain and wool, and beef and mutton which it has enabled the farmers to produce, it has proved the source of immense wealth.

What the turnip husbandry has done for England the sugar beet cultivation is now doing for France; with this superior advantage, that the sugar obtained must be considered as, to a degree, an extra profit. The leaves and the pumice afford a large amount of feed for stock; the cultivation which the plant requires, prepares in a capital manner, the ground for other crops; and the increase of live stock on the farm where plenty of feed is produced in order to keep them, carries every thing else forward in a rapid ratio. The sugar obtained from the root affords a most ample profit, were there nothing else obtained from the cultivation.

The agricultural publications now going on in France, of which we have received several of a most valuable character, indicate an extraordinary attention to this great subject, and a high degree of improvement.

In reference to the manufacture of sugar from beets, we learn that so far as cheapness of operation and amount obtained per centage, the business was never more prosperous. The improvements which have taken place within a few years, are very great. The beets are now operated upon by tapping or grating as soon as taken from the field; and this often early in September. It is then leached, if the expression be proper, by cold water. This carries down all the saccharine matter, leaving behind all the muckage, which has given to the sugar an unpleasant taste; and to get rid of which has long been a great desideratum. The saccharine matter is then subjected to a process of purification, crystallization and refinement, which enables them to obtain at least eight per cent. of sugar, and at so moderate a rate, that they can afford to pay the government excise of seven cents per pound, and leave a handsome profit to the farmer and manufacturer. From all that can be learnt, there is little doubt that the improvements are such that it can soon be made an article of profitable household manufacture. This is a great desideratum, and a point which we confidently believed at one time had been gained by our respected friend at Stoneham; but in the absence of all advices from him, we are gratified with this intelligence from abroad, which we have received from an authentic source, and have only to congratulate ourselves that in spite of all delays and hindrances, the world will go round. This will give us a highly gratifying. Europe now is only half a month's journey, and the spirit of enterprise and public spirit diffuse intelligence almost with the rapidity of light. H. C.

BERRY'S OLD DUTCH.—A farmer of Dutchess Co. N. Y., has sent the editor of the Poughkeepsie Telegraph, samples of sugar beets and mangoed warts, with a memorandum stating that his crop of beets in a harvesting, would amount to from 1000 to 1200 bushels, from less than an acre of land, and that the average cost of raising them will not exceed 6 cents per bushel. The six largest of the sugar beets weighed 67 lbs., the heaviest one 13 lbs.—American Farmer.

AN INTELLIGIBLE RECIPE.—A lady at the Springs last summer, being desirous of obtaining the recipe for making a certain pudding, to be met nowhere but at Congress Hall, applied to the superintendent for the same. It was immediately furnished in the following clear and conspicuous terms:—"Take a few eggs, a quantity of milk, a thingfull of currants, a thingfull of meal, a thingfull of wine, three thingfulls of flour, and sweeten to your taste."

MISCELLANEOUS NOTICES.

To Manage a Rearing Horse.—In preference to the dangerous experiment of putting a rearing horse back-ward, I recommend the adoption of the following method:—Whenever you perceive the horse's inclination to rear, separate your reins and prepare for him; the instant he is about to rise shake one hand and bend or twist his head with the other, keeping your hands low. This bending compels him to move a hind leg, and of necessity brings his fore feet down. Instantly twist him completely round two or three times, which will confine him very much, and completely throw him off his guard. The moment you have finished twisting him round, place his head in the direction you wish him to proceed, apply the spur sharply, and he will not fail to go forward; if the situation is convenient, press him into a gallop, and apply the spur, and whip two or three times (but not more) severely. The horse will, perhaps, not be quite satisfied with the first deflection, but may feel disposed to try again for the mastery. Should this be the case, you have only to twist him, &c. as before, and you will find that in the second struggle he will be more easily subdued than on the first occasion—in fact, you will perceive him quail under the operation. It rarely happens that a rearing horse, after having been treated in the way described, will resort to his tricks a third time. But on going into other hands, and having another rider, he will be very likely to have recourse to rearing.—The Sportsman.

Whimsical Calculation.—What a noisy creature would man be, were his voice, in proportion to his weight, as powerful as that of the grasshopper, which may be heard at the distance of one-sixteenth of a mile. The kolibri weighs about half an ounce, so that a man of ordinary size weighs about as much as 4000 kolibris. One kolibri must weigh at least as much as four grasshoppers. Assuming, then, that a man weighs as much as 16,000 grasshoppers, and that the voice of one of these may be heard at the distance of one-sixteenth of a mile, that of a man, were it in proportion to his weight, would be audible at the distance of 1000 miles; and when he sneezed he would run the risk of bringing the house about his ears, like the walls of Jericho at the sound of the trumpets. Assuming, further, that a flea weighs a grain, which is something more than its real weight, and that it is able to clear one inch and a half at a spring, a man of 150 pounds weight would, by the same rule, be able to make a spring over a space of 12,500 miles, and consequently leap with ease from New York to Cochiti Chum. Aristophanes represents Socrates and his pupils occupied in a similar computation. They are exhibited calculating the weight of a flea's leg in proportion to that of its body. The homical calculation of Aristophanes, however, falls far short of that of the New York San.

Corn Puzzle.—The following "puzzle for the curious" appears in the Worcester Journal.—If a person were to take a single wheel corn in his pocket to market on New Year's day, and double the same every week for 52 weeks, or till New Year's day again, it would amount to more loads of wheat, 20 bags each, 3 bushels to a bag, than it would take Hank-moore to build a stack 25 times higher than the top of St. Paul's. In a box (supposing a stack could be built), reckoning the building 141 yards, and allowing 100 notes to an inch. 2d. After this was deducted there would be more loads left, 20 bags each, than any ten millers ever bought bags of wheat in their lives, allowing each to buy weekly 2000 bags for eighty years. 3d. After this deduction there would be more loads, 24 bags each, remaining than it would take Hank-moore to cover 199 square acres of ground, allowing each acre to measure 6 inches by 4. 4th. After this deduction there would be more loads left than the wind of a coach would turn round times in a distance of 1200 miles, supposing the wheel to measure 17 feet in circumference. 5th. This would leave more loads than it would take barley corns to reach from Worcester to Abington, a distance of 17 miles, allowing three barley corns to an inch. 6th. This would leave more loads than it would take tons of coal to supply the city of Worcester for 31 years, allowing 83 large or boat loadings to be brought every week for 31 years, and allowing each barge or boat to carry 64 tons, which would load 137,280 boats or barges, 60 tons each. 7th. After these deductions there would be more loads left, 20 bags each, than it would take pounds to build sixteen county courts, allowing each to cost \$50,000. 8th. There would be more loads remaining than that it would take bags, three bushels each, to load 3000 barges, allowing each barge to carry 500 bags. 9th. After all these deductions there would be wheat enough left to find 2500 persons in bread for 66 years, allowing each person to eat annually nine bags. All the

quantity of corn to be her wheel load 1,125,890 bags, 1000 quarters each. The amount of all the number of corns is 1,503,599,627,379,935. Reckoning 500,000 corns to fill a bushel is 9,000,199,254 bushels.—Number of bags, 3 bushels each, 3,002,399,751.—Number of loads, 20 bags each, 150,119,987.

WINTER EVENINGS.

Long elegant winter evenings. These constitute one of the charms that in our cold varying climate. Our winter evenings are sufficient to reassure us to our locality on terra firma, so valuable are they as the season for fire-side amusements and intellectual improvements. What a pity it is they are generally wasted. We have known many an indigent mechanic who would tumble into bed by eight o'clock, while his pains-taking spouse worked till eleven or twelve, and many a farmer's wife will work till midnight, while her husband dozes in the chimney corner. This dozing is a bad habit. If you need sleep, go to bed and have it, and then be wide awake when you get up.—Don't allow yourself to snore in the corner—it is ill-bred and indelicate. A man who will sleep in an animal while his wife is hard at work, don't deserve to have a wife. Take a look at a newspaper, and read to be these long winter evenings. It will be a mutual benefit. It will dissipate much of the gloom and inquietude too often engendered by care and hard labor, it will make you more happy, more useful, and more respected. Our farmers are too apt to mispend the long winter evenings in idle grubbings at "hard times," high taxes, and made in degenerating. Finding fault with need the times. They must read, improve themselves, and educate their children, that the next generation may be wiser than their fathers. Our farmers are but half acquainted with the rich resources of their soil. Were they familiar with the most improved system of husbandry, they might readily become so by devoting these long winter evenings to the reading of books which treat upon this subject, they would have much less cause to complain of hard times. Some of the greatest and best men of our country were sound practical farmers. But they were not ignorant farmers. They were men whom great empires called from the seclusions of private life to take part in great national affairs, and when the state of the country no longer required the exercise of their talents, they returned again to the peaceful and honorable labors of the farm. When our farmers are better informed, and not till then, may they hope to take that rank, and exert that influence in society, to which the respectability and importance of their occupation so justly entitled them. We again say, let our farmers, our mechanics, and our apprentices read—spend their winter evenings in acquiring useful knowledge, as the best remedy for hard times, and the best preservative from folly and dissipation.—Ed. ed.

GENUINE POTATOES.

THESE celebrated potatoes are for sale at the Rochester Seed Store, at the following low prices—\$2 per bushel—\$3 per barrel, (24 bushels). At the price will be doubly advanced in the spring, those who wish to obtain them will do well to order them soon.—They will be safely kept all spring, if desired, and sent according to order. M. B. BATEHAM, January 1, 1840.

ROCHESTER SEED STORE.

MADE LIBERALLY, which this establishment has preserved for seven years past, and the irrefragable evidence that the proprietor possesses the confidence of his public, and the efforts to be commended by the community, are not unappreciated. While he expresses his acknowledgments for the past, he is happy to announce his friends, that he is now to be a more prudent and successful farmer, and is considered that he will cross a good and profitable year, and will be able to furnish his friends with a full supply of all sorts of seeds, and will have been his former experience in the many years of his seed and fields, which was desirable to import. And, in order to remedy the evil, he proposes to visit over to Europe himself, and procure a supply for this season, and the seed and arrangements for the future, as will prevent all difficulty in obtaining supplies in that country.

The present stock of imported seeds is very extensive, the whole of the new grain crop among the best growers of England and Scotland. A very large and many improved varieties, which will be of great assistance to our growers and fields. Some of our American seeds are also very large. They were all of the past season, in the most careful manner.

With his present advantages, and experience in the business, the proprietor offers himself that he will be able to attend against every source of complaint, and furnish an abundant supply of superior seeds at very reasonable prices. Any person who has seed from him which proved bad, last year, are requested to mention the circumstances to him, that remediation may be made.

New Catalogues will be published soon, and sent (with applications) gratis. M. B. BATEHAM, Rochester, January 1, 1840.

PRINTED BY MARSHALL & WELLES, CORNER OF BRIDGE AND EXCHANGE-ST., ROCHESTER.

NO ADVERTISEMENTS will be inserted in this paper, except such as relate to matters connected with Agriculture and Horticulture; and these will not be allowed more than 2 or 3 insertions.

MORUS MULTICULIS FOR SALE.

THE Subscriber offers to those who wish to engage in the silk business, in Western New York, good sized and healthy trees of just-so-called growth, and measuring from three to four feet in height, and unimpaired, on a reasonable terms as can be seen in person. All orders in relation thereto, put paid, will meet with prompt attention. E. I. MARSHALL, Corner of Buffalo & Exchange-sts., Rochester, Jan 1, 1840.

TO NURSERYMEN AND OTHERS.

THE following seeds were procured in Europe, especially for Nurserymen. The supply is not large, and those who wish any of them should order soon: English Silver Fir, Norway Spruce, Larch, English and Scotch Larch, Broom, Fir, Beech, Birch, Spruce, Cypress, Horse Chestnut, Also, for sale, 20 bushels of Fine Peach Stones. A correspondent wishes to dispose of a few hundred young Apple Trees in A-b Trees. M. B. BATEHAM, January 1, 1840.

AGENTS

FOR THE ROCHESTER SEED STORE AND NEW GENESEE FARMER.

THE following persons will, in a few weeks, receive full assortments of seeds from the Rochester Seed Store.—They will also receive subscriptions for the Farmer.

- Buffalo, W. & G. Bryant, Lockport, H. Marks & Co., Albany, B. & C. Clark, Brockport, George Allen, Southville, Andrews & Garbutt, Le Roy, Tempkins & Morgan, Ellettsville, V. D. Verplanck, Albany, R. N. Wells, Perry, J. B. Parsons & Son, Mount Morris, R. Sheer, Geneva, F. & G. W. Wyman, Canton, B. Hayes, Geneva, J. N. Bogert, Watron, Abram Duell, Auburn, T. M. Hunt, P. Luyra, Hoyt & May, Newark, Doane & Co., Syracuse, T. B. Fitch & Co., Cuba, J. E. Warner, Oswego, M. B. Elson.

In answer to the numerous applications which are made for seeds on commission, I would here state, that I do not furnish seeds in that way except to regular agents; and I do not wish to increase the number of them at present, especially at far distant places, or small villages. M. B. BATEHAM.

Remarks.—Owing to the extreme scarcity of money, but little is at present done in the purchase or sale of produce; and some of the above prices are merely nominal, there being nothing done in the articles.

We live in hopes of seeing better times, (at all events, we have no fears of seeing worse,) and would advise farmers to bring nothing to market at present, with the expectation of obtaining money, with the exception of such things as are particularly adapted to the season, and constitute the necessities of life. We hope to give better encouragement in our next.

Alteration of Terms to Agents, &c.

The very low price at which this paper is published, will not admit of a very liberal compensation to agents. But owing to the extreme scarcity of money, and other unfavorable circumstances, we have concluded to offer additional inducements to those who can send us a few names, but who think they cannot obtain a large number.

We will, hereafter, send seven copies for \$3; twelve copies for \$5; and twenty-five copies for \$10. The money, in all cases, to be sent free of postage. We make this offer, in the hope and expectation of greatly increasing our subscription list. And we most respectfully ask all Post-masters, and the friends of agriculture, especially in the Genesee Country and the West, to lend us their aid. Without vigorous effort, on the part of the friends of the cause, a paper of this kind cannot be sustained, at a price which places it within the

reach of all. We scarcely believe there can be a post-office, or neighborhood, where an agent cannot, by a little effort, at least obtain enough subscribers to secure himself a copy gratis. Will you try it?

Number one, and Number two.

Our stock of number one became so much reduced that we could not send it to as many persons as we desired. We have, therefore, printed a few hundred extra copies of number two, which we send, as a specimen, to some persons who are not subscribers, and have not received the first number. If any who receive it do not wish to subscribe, they will oblige us by handing it to their neighbors, who, on examination, may wish to take it.

Post-masters and agents are requested to take care of any extra copies which they possess of number one, and be careful to mention to as such new subscribers as are supplied with it.

To Readers and Correspondents.

We feel great pleasure in presenting our sheet to the public this month. The numerous and able communications which it contains, coming, as they do, from men of science, and talent, and worth, as well as from men of great practical experience and devotion to the cause of agriculture, cannot but be regarded as a proof that Western New York, the justly famed Genesee County, is still determined to have the honor, not only of being called the richest agricultural section in the Union; but, of sustaining one of the best agricultural Journals in the Union.

Owing to the insinuations of those whose interests are opposed to the success of this paper, some persons have looked upon our efforts with a degree of doubt and suspicion. To such persons we would say, do not oppose us,—let our deeds testify,—let the prompt and able assistance, together with the unqualified approbation which our undertaking has received from the friends of improvement, throughout the land, testify; and then say whether the New Genesee Farmer is not entitled to the confidence and support of the community, and whether it will not attain as high a reputation, for talent and usefulness, as did its predecessor.

To our friends and correspondents we would say, you have our sincere thanks, and you may have the satisfaction of knowing that your labors are doing good to ten thousand readers. And for their sakes—for the sake of the cause of agriculture, and the honor of the Genesee Country—we entreat you to continue your contributions, and enlist others in behalf of our undertaking, and success and usefulness shall crown our efforts.

Editors of Newspapers need not take the trouble to send us their papers in exchange, unless specially requested. Those who have kindly noticed our paper shall receive it for the year. Any others, who desire it, can have it on the same terms: only sending us the paper containing the notice.

Attention, Farmers!

We advise every farmer, into whose hands this paper may fall, not to throw it carelessly aside. It contains matters of great importance to every cultivator of the soil, and deserves a careful perusal. Is he a farmer of Monroe County? we ask him first to read the appeal of his sincere friend and brother farmer, "X. Y.," and also of "Moskov." Does he belong to some other part of the Genesee Country, or the West? let him first read the Message from "GENESEE," or "C....."

The articles in this paper are mostly written by practical farmers themselves, men who work hard with their hands as well as their heads, who speak what they do know, and write of what they have seen.

GREEN AND DRY WOOD FOR FUEL.

We sometimes hear the opinion advanced, that of green and dry wood, in equal quantities, the former produces the greatest amount of heat, in combustion. More frequently it is asserted, that although green wood may not produce more, if as much, heat as dry, yet it makes a much hotter fire.

In determining these questions, two things are to be taken into consideration, which are very important. The first is, the quantity of heat which is lost by escaping through the chimney; and the second is, what kind of wood prevents most this loss.

It has been found by experiment, that in a common brick fire place, nine-tenths of the heat is lost. By such a mode of warming houses, therefore, that kind of fuel which will produce the greatest quantity of heat, is not necessarily the most effective. Dry wood, for instance, may cause a strong upward current, and so occasion the loss of a greater quantity of heat than green wood. The latter, though not actually producing so much heat, may still warm a room better, in proportion to its heat, by throwing it more into the room. A parallel case occurs in the blacksmith's forge, where water sprinkled over the surface of the burning coal, by cooling that surface, and thus preventing the enclosed heat from flowing out so freely in hot currents, causes a greater heat within, and a less rapid combustion of the coal without, than would otherwise be the case. So green wood, placed upon an open fire, by lessening the draught, and continuing longer in burning, may produce more heat, in the room, or at least, more in proportion to its actual heating power, than dry wood. This, of course, applies to the common mode of burning green and dry wood, by splitting the former unnecessarily small. There is no doubt, however, that if wood is well seasoned, and the sticks very large, so as to produce much less current, and a longer combustion, it would impart more heat to a room than green wood, even from an open fire place.

But in stoves and hot-air furnaces, where a large portion of the heat is saved, the difference between green and dry wood, and in favor of the latter, becomes strikingly apparent. We have recently had a good opportunity of ascertaining this difference with some degree of precision, by means of a hot-air furnace, and find that good and sound green maple wood produces only about one-third as much heat as the same kind in a well-seasoned state.

This difference is owing to the large quantity of water contained in green wood, which it is necessary to evaporate before the wood will burn. And in evaporating this water, it will be recollected, that a large amount of heat passes off in a latent state—that this amount is about four times as great as is required to heat the water from the freezing to the boiling point. The writer of this article has made experiments to determine the quantity of water contained in green wood, and has found it to be at least one-third of the whole weight of the wood; that is, seasoned wood is only two-thirds as heavy as green. A little calculation will show that there must consequently be at least six barrels of water in a cord of green wood, which must all be evaporated before the wood can burn. The latent heat carried off in the vapor of this water must be four times as great as is required to heat it from freezing to boiling; that is, in every cord of green wood which the farmer burns, he loses as much heat unnecessarily, as would be required to boil twenty-four barrels of water.

Farmers should, therefore, cut and cord their wood a year in advance—and its value for burning in stoves will be more than double by this reasonable care. Now is the time.

SEASONABLE HINTS.

It is of great importance now, as during the whole of winter, to be vigilant in keeping farm stock in good condition. Cattle should be kept as well fed, as comfortable, and as fat as in summer. Young cattle often lose as much in their growth by imperfect care in winter, as ten times the cost of good keeping over bad.

Cattle should be watered regularly—should have salt frequently—and if kept in stable, should be kept clean and well littered.—If plenty of straw is used, it will make plenty of manure.

When cattle are fed together, see that the strong do not oppress the weak—if any get into a bad condition, put them apart from the rest and give them extra food until they recover.

Hay or straw, of inferior quality, used as cattle fodder, should be sprinkled with brine to make it palatable.

Culvers, which at this season should be fattened for killing, should be kept very clean, and well and regularly fed.

Great pains should be taken to keep pigs in the best condition—otherwise their growth will be greatly impeded, and they will continue poor through half the summer, and their ultimate value much lessened.—Proper keeping costs but little and saves much.

Care should be taken that cows are milked clean, the more so as the operation is more tedious in winter than at other times. Want of attention in this respect will soon cause them to become dry, which in young cows is a lasting detriment to their value, as when dried too soon before calving, they rarely recover from the habit in subsequent years.

Apple trees may be pruned to advantage during the comparative leisure months of winter. By thinning the top—cutting out crooked and stunted limbs—the fruit is greatly improved in quality. The work is best done with a saw, and large wounds prevented from cracking and decaying, by applying a coat of a mixture of hot tar and brick dust. It is also a very proper time for pruning hardy grape vines, if not already done, observing to cut off the less thrifty branches and leaving a few of the most vigorous buds for growing. If done now, the wounds become dry before the bleeding season commences in spring, and all danger from that cause effectually prevented. There are many cultivators of hardy grapes, who lose much of the value of the crop, and obtain fruit of comparatively very inferior quality, by suffering their vines to become thick and stunted in their growth, thus greatly diminishing the size, quantity, and excellence of the crop.

There are many other things which should not be forgotten—such as repairing tools and farming implements—cleaning and oiling harness—drawing and cutting fuel to last through the summer—drawing materials for fences, &c. A day's work in winter will often save ten dollars in summer.

Preparing Manure for Hot Beds.

Gardeners who intend to grow early vegetables by means of hot-beds, should commence making preparations for that purpose during the present month.—The manure should be got together two or three weeks before it is intended to form the hot-bed, and thrown into a heap, raising it up in such a manner, that it will ferment thoroughly. Fresh stable manure, containing a good proportion of litter or straw, is the proper kind for this purpose. The quantity required for a frame, say 10 feet long, and 4 feet wide, is about six good wagon loads, supposing the bed is made early in March. If the bed is not made so early, a less quantity will suffice.

Directions for making and managing hot-beds will be given next month.

Procuring Seeds, Tools, &c.

Farmers and Gardeners should improve the present good sleighing, and comparative leisure time, by procuring their spring supplies of seeds, implements, or any articles which may be required from a distance. Frequent opportunities may now be found for sending or going for such things without any difficulty or expense; whereas spring will soon be upon them with all its wants, its hurry, and its bad roads, when it may be extremely difficult to obtain such things, however desirable.

THE SILK CULTURE—OUR VIEWS.

Since the first number of the New Genesee Farmer made its appearance, we have been repeatedly asked what are our views on the subject of Silk Cultivation and whether we intend to favor its advancement in this section of country. Our answer is, we regard the subject as one of the most important which can, at the present time, engage the attention of the American people, and one which we believe is destined, at no distant period, to form a new era in the prosperity of this nation. We have full confidence in the success of the cause, and shall endeavor to awaken a more general interest on the subject, among our readers.—At the same time, we wish our silk growing friends to bear in mind, that justice to our readers requires that only a small portion of our columns should be devoted to this subject. Our duty, and our aim is, to do the greatest good to the greatest number of our readers, and so long as not more than about one in a hundred of them is particularly interested in this department of agriculture, of course we can only publish such occasional articles on the subject, as will be most likely to excite an interest in their minds.

We are located in the midst of the greatest grain producing country in America, if not in the world; and the "Genesee Farmer" is well known as the channel of communication to thousands of men whose well directed labors and fertile soil, supply millions with bread. In this section and much of the Western country, the production of wheat, is, and ought to be the principal aim of the farmer. At the same time, however, much may, even here, be done to advantage in the production of silk, and that too without materially interfering with the production of grain. The quantity of land required for this business is comparatively small, and the kind of labor is such as may mostly be performed by females and children, whose labor is now of little or no avail.

We expect soon to learn that many of our readers are engaging more or less in this business, and hope, ere long, to see the fair daughters of Genesee, clad in silk, produced on their own soil, by domestic industry.

There are several periodicals now published in this country, which are exclusively devoted to the subject of silk culture, and one or more, of which should be taken by every person engaged in that business, in order that his efforts may be successfully directed.

"The National Silk Farmer" is the title of a proposed new paper, to be published by JOHN R. SAYRE, of Philadelphia, under the patronage of the "National Association for the promotion of the Silk Culture in the United States." It was proposed to be issued weekly, on a sheet about half the size of the New Genesee Farmer, (8 or 9 square,) priced two dollars per annum, or \$1.00 per copy. It has commenced Jan. 1st, 1840. We received an outside impression of the first number, and are much pleased, but nothing more has been seen of it, as yet. If it goes on, we should be glad to see the clearest and most valuable paper of the kind, or of the section of country.

"The Silk Grower" is published by the Messrs. CHERRY, at Burlington, N. J., in pamphlet form, monthly, each number containing 32 octavo pages with a printed cover, price \$2 per year.

"The Journal of the American Silk Society" is published by GILES B. SMITH, Baltimore. The last number of the first volume of this work has just reached us. The following prospectus for the new vol. contains interesting statements, and will explain the character of the work:

"This Journal was established by the American Silk Society, for the purpose of diffusing practical information on the culture of silk in the United States. It has now been published one year, and may be considered a work of standing character. The first year's publication, comprising the first volume, contains a mass of valuable information, and it will be the object of the editor to make the second equal in all respects, if not superior, to the first. The important fact is now established beyond any question, that the people of the United States can make silk cheaper and better than any other nation upon earth. It has been proved by unimpeachable testimony, that the average cost of producing silk ready for market, does not exceed two dollars and twenty-five cents per pound, and its lowest value is four dollars and fifty cents; also that one acre of ground, planted in mulberry trees, will produce, the first year the trees are planted, forty-eight pounds of silk, leaving a clear profit to the grower of one hundred and eight dollars! It has also been proved that the children and females of any farmer's family can, with the greatest possible ease, produce from fifty to a hundred pound of silk every year, without so much clear gain, as from \$225 to \$540. With these facts, we submit to an intelligent people whether it is not a great and an important object for them to introduce the culture of silk in every farmer's family in the Union. To enable our farmers to make silk, the 'Journal of the American Silk Society' was established; it contains plain practical directions for cultivating the trees, feeding and rearing silk worms, reeling the silk, and preparing it for market, &c., besides all other information that can be required to enable any person to enter upon the business, either upon a small or large scale. Every friend of his country, into whose hands this paper may fall, will be doing a patriotic and philanthropic work by inducing his friends and neighbors to enter their names upon the list of subscribers.

The Journal of the American Silk Society is published monthly, in pamphlet form: each number contains thirty-two octavo pages, printed on new type and hand-made paper, with a printed coloured cover.

TERMS:—Two dollars a year, or six copies for 12 dollars, always to be paid before the work is sent; subscriptions to begin with the first number of the year, and in no case will the work be sent to any subscriber longer than it shall have been paid for.

For Non-Subscribers, who take the first and second volumes, will be charged only Three Dollars for two years.

For Subscriptions for either of the works will be received at the Rochester Seed Store, and New Genesee Farmer Office.

VALUE OF SWEET APPLES.

We have frequently had occasion, in former years, to urge the importance of the culture of apples, especially sweet ones; and it has long been our decided opinion that before many years have elapsed, the crop of apples will be considered as second to the wheat crop only. We wish to state the grounds of our opinion.

In proof of the value of apples, experiments have been made, by which it appears, that hogs fed with them, increase much more rapidly in weight than when fed upon potatoes, in equal quantity. It were needless to multiply instances. It is believed that the advantages in favor of apples would be still greater when both are fed unseparated.

But the superior cheapness of apples is their great recommendation. An apple tree will stand on a spare rod, making one hundred and fifty to the acre; by selecting productive varieties, good soil, and keeping the ground cultivated, we may safely count upon five bushels of apples per annum from each tree, which would be eight hundred bushels to the acre. If the trees are kinds which grow large and require more room than one square rod, they will produce more, and so compensate for their fewness. The cost, or value, of the land and orchard, may be estimated at

eighty dollars; and as the crop obtained from the ground would pay for cultivating it, the whole expense of the apple crop would be the interest on eighty dollars, that is, five dollars and sixty cents for eight hundred bushels: which would be at the rate of *seven-tenths of a cent per bushel*. It is probable, however, that the land would rent for a trifle for tillage, which would still reduce the cost.

Now, it is very rare that root crops can be raised for less than six cents a bushel; and as they are less nutritive, as has been already shown, the greatly superior advantages of the culture of apples becomes at once manifest.

There is another point which should not be overlooked,—that is, that no labor is required, after an orchard is planted, in keeping up the culture,—no sowing nor planting, no weeding nor thinning—the apples, as a farmer observes, “raise themselves;” which is a very important consideration in a country where labor is costly, and land comparatively cheap.

Scraps from our Memorandum Book.

INSIDE PAPERING OF ROOMS, may be cleaned in most instances by rubbing over the soiled part with a piece of bread, which adheres to and removes the dirt. India rubber might also be useful in many instances. Inside work, painted in oil, should be rubbed with flannel dipped in warm water, and afterwards wiped with a dry cloth. Loudon says, “In general, it will be found the best economy to have the ceilings of the living-rooms painted in oil, and to have the walls either painted, or covered with what is called wa-hing paper, the colors of which, being in oil, admit freely of being washed with flannel or sponge, and water.

Transplanting.

It is not very common that too much pains are taken in transplanting trees. A man is hired at a dollar a day; and to make the most of his work, thirty trees are put in hastily, instead of twelve thoroughly; and twice the amount of his wages is lost by trees dying from superficial transplanting, and more than as much more by their subsequent stunted growth.—A humorous writer says, “Whenever the trees are to be or have been long out of ground, take care to dry up the roots, by exposing them as much as you can to the sun and air; do not be nice in planting, but do and say with Twigg’s uncle:

“I rans ’em in,
Now thick, now thin;
For what cares I
If they grow or die.”

Preserving Hams from the Fly.

We are informed by a very experienced person, that a very effectual and easy method of preserving hams from the attack of the fly, is to rub over the fleshy part, just before they are hung in the smoke-house, a spoonful of finely ground pepper to each piece.

Razor Straps.

It is well known that the oxide of tin has been very successfully used as a paste for razors:—an excellent mode of applying the oxide to a strap which has lost its efficacy, is to rub it strongly across a tin vessel, there being, in ordinary cases, sufficient of the oxide upon its surface to coat the surface of the strap.

Value of Fruit.

PRINCE'S IMPERIAL GYMNASTIC.—The tree is of extraordinary productiveness. The fruit is larger than the green grape, and of excellent quality. A single tree of this variety at Charleston, (Mass.), owned by Samuel R. Johnson, has for several successive years yielded crops which were sold at from forty to fifty dollars per annum.—*Kerrick*.

Marking Bags, Tools, &c.

Bags, tools, vessels, &c., are frequently lost for want of the owner's name upon them; a simple mode of marking is therefore of some importance. Paste-

board is frequently used, through which the letters of the name are cut, and placed upon the object to be marked, the paint from a brush passes through and marks the name accurately. But paste-board often becomes softened by the paint, the corners curl, and the letters are defaced. To remedy this, tin-plate is substituted for paste-board, but the labor of cutting the letters is much increased. We have found, however, that *thick sheet lead* possesses the advantages of both; the letters may be cut with great facility, and they retain their shape as well as when cut through sheet tin.

Raising Water from Wells.

A good pump is one of the very best modes of raising water; a bad one is worse than the old-fashioned “sweep-pole” and bucket. But as pumps generally slightly affect the taste of the water, especially when little used, many prefer drawing water from the kitchen well, by means of a drum for the bucket rope to run upon, and a heavy counterpoising weight running upon the axle of the drum. The chief difficulty, however, appears to be in procuring a suitable weight for this purpose—a large stone is commonly used, a hole being drilled into it, and a hook attached to the stone by pouring round it, into the hole, melted lead. But a much easier, and far more neat and convenient way is to fill a *keg* with stones, or better still with broken cast iron or iron pigs, and pour sand into the interstices. The weight of this may be regulated at pleasure by the quantity of materials in the keg. The keg should be suspended by a strap of harness leather, two or three inches wide, which winds concentrically upon the axle.

For the Non-Genesee Farmer.

FARM STOCK--NO. 1.

MISERABLE EDITORS.—It is a very pitiable sight, to go about our country and see the condition of the multitudes of cattle and sheep which fill almost every farmer's yard in the spring of the year. The severity of our winters, with bad management, are, in my opinion, the sole causes of so much poverty among our cattle. The fact is, farmers keep too much stock, therefore, some, of course, must look poor in spring. Many farmers leave their farms overstocked with horses, and do not cut fodder sufficient to keep them, as they ought to be, to look fine in the spring of the year. Of this, many are now sensible, and are determined to diminish their stock at all hazards, and even dispose of the greatest share, and see if they cannot, hereafter, cut fodder enough to winter the remainder. The fact is, Messrs. Editors, farmers want to keep a large number of cattle, and at the same time grow large crops of wheat, which it is impossible to do and keep them in the condition they should be. If a farmer desires to grow wheat largely, let him do so; and if he desires to raise stock, let it be his sole business; but by no means attempt both in large quantities upon one farm, because it is running the land too hard, and will very soon spoil it for any thing. In this country, where the land is so well adapted to all kinds of grain, farmers would, in my opinion, do much better to raise wheat than stock. One great detriment in raising stock, is, the winters are so very long and severe, that it is almost impossible to winter a herd of cattle through, without having them reduced almost to skeletons. It very often required all summer to get cattle and sheep in as good a condition as when winter commenced. If we here advise to go into the stock growing business in this cold latitude, we must see that our cattle and sheep are well taken care of, and have sufficient to eat all winter in cold weather. In pursuing this course, we may grow stock to a small extent, but without it, it is impossible to have them good.

Yet there are many, however, who have been pinched in past years, who will, most likely, as soon as grass comes, forget their troubles and resolve; and

as their calves are dropped, say, “Well, it is a pity to knock such a pretty calf in the head—I can't spare the milk to fat him, but I can bring him up on skim milk,” and thus he is suffered to live, a skim milk calf, sure enough; and the next, and the next, and so on to the last, are also suffered to live. Now, sirs, a calf will live through the summer on skim milk, but as soon as cold weather comes he will begin to fail, and ten chances to one whether he survives the winter. It is a very poor plan, in my estimation, to try to bring up calves on skim milk—they will never look half as nice as those brought up on sweet milk or those that suck the cows, nor make half so good cattle at three years old. If we intend to raise calves, (or any thing else,) let us try to raise them as they ought to be.—Nothing looks so handsome in the winter season, as to go into a barn yard, and see the cattle all in a good, thriving condition, and have a comfortable situation, to repose through the cold winter storms. When we see such, we may rely that the man is a good practical farmer, and has some pride in taking care of his domestic animals.

Now let us look on the other hand, and see the farmer that has no protection for his stock. We see at once that his cattle and sheep are always in a very poor condition, and very probably ere spring arrives he will be complaining about losing cattle, and wonders why they should be so much poorer than his neighbors, when perhaps they have a good supply of food three times a day. It is obvious such farmers neglect to provide shelters, and hence the difference.

Sheep are, in my opinion, very much neglected.—Many think, because they have a thick coat of wool, they need no shelter, and many are thus lost. They need as much protection as our horses; that is, if we expect great profit from them the coming season. If sheep are not well wintered, their wool will not be very good, and more than this, they will be so very poor, that it will be a very great trouble to shear them.

What looks more pitiable in the eyes of the passer-by, than to see sheep and cattle all foddered together? and some of them with their fleeces almost torn off, others, as the old saying is, “about ready to kick the bucket,” and only by neglect of the farmer.

Some farmers still continue in their old practice of farming, and say there is naught to be learned by taking agricultural papers, and will not take them.—There are, however, very few but think such papers are useful to the farming community. By them, we learn different modes that have proved the best in growing all kinds of grain, and therefore saved a great deal of land labor and expense. Agriculture is improving very rapidly in Western New York, and will, in all probability, continue to do so. There is naught to hinder the farmers of this fertile and picturesque country from enjoying every thing so conducive to their peace, comfort, and happiness. They have first-rate lands, and by good management, may become more prosperous every succeeding year. It is not half the labor now to keep our farms in repair & do our work as formerly—we have various kinds of farming implements, such, for instance, as the patent plough, charr, and thrashing machine. Formerly, farmers had none but the old bull plough—no way to thrash wheat but the flail, which was a very slow process. Besides the great improvements in sowing tools, there are also great improvements in stock, so much so that the cattle and sheep now raised in Western New York are worth double, yes, treble, those grown formerly.

Respectfully yours, W. S. T.

South Union, January 14, 1849.

REMARKS.—Our correspondent has taken a very just view of the importance of winter protection for domestic animals. He has also very properly exposed the pernicious effects of attempting to raise twice

as much farm stock as can be profitably sustained on a given amount of food. The truth should be constantly enforced, that thorough farming is the most profitable—that a few, fine domestic animals, produce more, ultimately, than many poor ones—and that farmers should no longer take it for granted that cattle are to become poorer through winter than through summer, but that they should be kept as fat and as comfortable at one season of the year as at another.

We think, however, that no farmer should attempt to make the culture of wheat, or the raising of cattle, as his exclusive business. A mixed husbandry is doubtless for the most profitable for an extended course. By a continued practice of raising grain, land becomes exhausted; and by a continued grazing, the product of grass becomes diminished. An alteration not only corrects these evils, but it is absolutely essential to an improving system of farming. To raise large crops, manure is of the first importance, and this can only be manufactured by domestic animals. On the other hand, to feed cattle properly, grain and root crops must be cultivated for their food, and pastures are rendered most productive by enriching the land occasionally with manure and tillage. Thus these two departments of farming reciprocally assist each other, and the most profitable farming is that which thus constantly tends to improve itself.

The Culture of Mangel Wurtzel and Sugar Beet, for Stock.

BY WM. GARBUTT, OF WHEATLAND.

It is known to many of our readers, that Mr. Wm. Garbutt was one of the first who commenced the culture of the Mangel Wurtzel in this section of country. And while President of the Monroe County Agricultural Society, he did much to introduce that practice of root cultivation, which is now found so advantageous to farmers throughout the Genesee country. Mr. Garbutt has an extensive wheat farm, and keeps a good assortment of stock. He grows large quantities of roots, and considers this crop of great importance to the wheat farmer, as it enables him to till more land, and keep a larger amount of stock at the same time, to better advantage than he could possibly do otherwise. Mr. G. has kindly furnished us with the results of his long experience in the culture of Mangel Wurtzel, which we are happy to lay before our readers.

It should be kept in mind, that the culture of Sugar Beets is in all respects the same as that of Mangel Wurtzel.

The Proper Soil and Preparation.

I consider a rather heavy loam, with an open gravelly bottom, the best of all soils for Mangel Wurtzel, or Sugar Beets. I had rather it would incline to clay than sand. Strong wheat soil, such as is too heavy for corn, if it has not a hard bottom, so as to retain too much wet, will do well for this crop, if sufficiently enriched. Some will suppose that such land will be too apt to bake and become hard in summer, but that is easily prevented by proper manuring and after tillage. Many persons fail in their root crops from want of a proper selection of soil, or rather from not adapting the crop to the soil. The Ruta Baga and Carrot will not flourish on a heavy soil, but require a sandy loam; while the English Turnips delight in new land or a low mucky soil, such as is too cool and wet for other roots.

It is very important that the ground for Mangel Wurtzel be not only of the right kind, but in the best possible condition—well enriched and free from weeds. The previous crop, therefore, should be some hard crop, as potatoes or corn, which should be well manured and kept free from weeds. In preparing the ground for Mangel Wurtzel, I would recommend that a good thick dressing of well rotted manure be spread on and ploughed under in the fall. The quantity of manure

should, of course, depend on the richness of the soil, but, I would say, be sure and *give enough*—the crop will repay, with interest. There is little danger of this crop suffering from over manuring. I prefer ploughing the land in the fall, because it is desirable to plant early in the spring, and by exposing it thus to the frost during winter, it will be in much better condition in the spring.

About the first of May, which is usually as soon as the ground will work pleasantly, when not so wet as to clog, or so dry as to be lumpy, I prepare it for the seed. If the ground be manured and ploughed in the fall, I only give one good ploughing in the spring, with thorough harrowing (and if at all dry and lumpy, rolling and harrowing) until fine and mellow. If the ground be not made fine and in good order, it is difficult sowing, and the seed will not vegetate well.

I prefer ridging the land for Mangel Wurtzel, although some persons contend that it exposes the roots too much to the effects of drought. But if the ground be frequently stirred and kept free from weeds, there is little danger of the crop suffering from this cause.—Whereas, by ridging the ground, the roots have a greater depth of warm rich earth, and with me always succeed better than on a flat surface. I form the ridge by going through and back with a light plough. The ridges should be two and a half or three feet apart, so as to allow room for a horse to go between the rows.—If the top of the ridges are not smooth and mellow, it will be an advantage to go over them lightly, with a rake, by hand, before opening the drills.

Preparing the Seed, and Sowing.

The quantity of seed required for an acre is about three pounds. I had rather sow more than less, as it is easy to thin them out, and the cost of seed is nothing in comparison with the value of the crop. Much complaint is sometimes made of Mangel Wurtzel and Sugar Beets seed failing to grow. These seeds are not quite as sure of vegetating as some kinds; still, if rightly prepared, and sown when the ground is in good condition, before the weather becomes too dry, they will very seldom fail of growing. The seed should always be soaked in soft water, standing in a warm place, for three or four days before sowing. The shell of the seed is very hard, and requires a long time soaking for it to become softened so that the germ can burst it open. I have sometimes known it fail after being soaked, owing to late sowing and dry weather; but I have never known it fail from excess of moisture, even though soaked a number of days before sowing, and followed by long rains afterwards. My experience is decidedly in favor of early sowing. I prefer to sow as early as the first of May, if possible, and had rather sow a week or two earlier, than later.

When every thing is ready for sowing, I pour off the water from the seed, and roll it in white plaster, (slacked lime or flour will answer,) so as to give it a white appearance, in order that it may be more easily seen on the ground in sowing.

I have never found a machine or drill harrow with which I could sow the seed to my liking. My method is as follows:—I construct a machine for opening the drills, to be drawn by a horse. Take a piece of scantling, about 4 feet long, and 3 or 4 inches thick, in which place two thills or shafts for the horse, and two handles to hold by, like a small horse-rake; but instead of a number of teeth, only place one peg, or tooth, about one foot long, on the under side, within about a foot of the right hand end of the beam, so that when the horse walks in the furrow between the ridges, the tooth will come on the top of the right hand ridge, by passing along which it will open a drill for the seed. The machine can be easily guided, and the drills may thus be all prepared in a very short time. If the patch to be planted be small, of course the drills can be made by hand, with a hoe or stick.—

They should be about two inches deep, or so that the seed will be at least an inch deep when covered over smoothly. I sow the seeds by hand, scattering them along the drills, about two inches apart. This can be done very regularly and rapidly after a little practice. The seed should be sown as soon as possible after the drills are opened, and covered over immediately after being sown. Cover with a hoe or rake, so as to leave the ridges smooth, and the work is completed.

(Directions for thinning, hoeing, harvesting, preserving, feeding, &c. will be given in our next number.)

For the New Genesee Farmer.

Profits on a Peck of Rohan Potatoes.

Messrs. Editors—

As you have invited the farming community to cast in their mites, and promised if they came in their homely dress, that you will fit them to meet the public eye, I will venture to give you a few simple facts relating to my success in the noble calling of farming, or rather, in growing Rohan Potatoes. And, although I now appear in a borrowed name, I will be faithful to the truth, in order that when my real name shall become known, it may not suffer from what has appeared under the assumed.

Among my purchases at the Rochester Seed Store last Spring, was a peck of Rohan Potatoes, at \$1.50. I well remember that the quantity was no more, and so, no doubt, does Mr. Bateham's clerk, who sold me them: Mr. B. not being at all pleased with him for selling me so large a quantity as a whole peck, as he wished to accommodate all with a few, and had then only about a bushel left. I had secured the potatoes, however, and considered the purchase a good one, although I had no idea of making my fortune from a peck of potatoes. Still, as the sequel will show, there have been many, very many worse speculations entered into, and many a fortune made from a messer capital.

I sent the potatoes with many other seeds to a farm in the country, in which I have an interest, but neglecting to give particular directions about them, they were planted in the same manner as common potatoes, and had been in the ground a week before I learned the fact. I immediately had them dug up, and cut into pieces of a single eye each, and planted in hills, three and a half feet apart, three sets in a hill. Their after culture was the same as for common potatoes.—They were dug the first week in October, and yielded in good round measure, thirty bushels of the largest and finest potatoes I ever saw. I had a few of them sent into the city, 54 of which averaged more than 2 lbs. each—one weighed 2 lbs. 14 oz. I had a few of them baked and served up at one of the hotels, and they were pronounced, as they really were, excellent for the table—dry, mealy, well flavored, and free from hollow or spot, unlike overgrown potatoes of the common kinds. My farmer tells me he has no doubt that had he planted only two sets in a hill, and followed otherwise the instructions given in the Genesee Farmer, the produce would have been fifty bushels, instead of thirty. I may well be satisfied, however, with the amount I shall realize as it is. I sold a few bushels of my crop as low as \$4 per bushel, but the greater part of them are sold, selling, or engaged, at \$6 to \$8 per bushel.

4 bushels were sold early in fall at \$4, is	\$16 00
10 " engaged and sold since, \$6, is	60 00
10 " picked away to send to different places, at \$8,	80 00

\$156 00

I have full five bushels left for seed, which will amply pay the first cost and cultivation—thus leaving me a clean little profit of \$156 from my peck of potatoes, or the produce thereof.

Truly Yours,
JOHN NORTH.

Rochester, January 25th, 1846.

For the New Genesee Farmer.

The Importance of an Agricultural Paper in the Genesee Country.

Messrs. Editors,—I am much pleased with the appearance of the first number of your New Genesee Farmer. It is all that could be wished or expected; and while it is highly creditable to you, it is worthy of, and I believe will certainly receive, the support of all good farmers. I feel that the continuance of such a paper in this section, is of the utmost importance, not only to me, as an individual, but to the whole agricultural community. And if you will allow me a column for the purpose, I will give my brother farmers a few reasons why I think they should unite in sustaining this paper.

Having driven or held a plough for more than twenty years, in this country, (Genesee,) its soil and climate, and the peculiarities incident to each, which need to be attended to by a farmer, are more familiar to me than they can be to many among us, who have recently arrived from a distant or perhaps foreign land. While these bring with them industry and enterprise, a good, perhaps a superior, knowledge of the general principles of agriculture, and of its practice, too, as adapted to their former place of residence, they must, from the nature of the case, be ignorant of the local peculiarities of their new homes—of the particular character of our soil, and our crops—of the best time and place to market their produce and obtain supplies, &c. Now, to such persons, what can be more important than a publication which has for one of its objects, the giving of this very information, and where a "new comer," when he finds his former experience at fault, may apply with an assurance of having his questions answered by those, whose longer residence here has rendered these local matters familiar. But this is not all, which I wish to say to this class of farmers. While we are ready to give information on all these points, we ask, in return, some of the knowledge which our new neighbors bring with them, from a distance. For this purpose, your paper affords the best possible means of communication, and indeed the only one, except travelling and conversation, both of which must be casual and limited; I would, therefore, most earnestly call on all such, to aid this publication, as subscribers and contributors.

But it is not to these alone, that your paper offers valuable aid—valuable far beyond the small sum demanded for it. The general principles of agriculture may be learned, as the general principles of any other science, from books. But not so, the practice,—this can only be learned by *experience*,—your own experience, or your neighbors'. And this experience must, from the very nature of the case, be local; it cannot be brought from a distance; for, although the general principles remain the same, experience only can teach how far they are affected or modified by the peculiarities of our own soil and climate. It is from a forgetfulness of this fact, that our "Book Farmers," (as they are frequently called,) so seldom succeed. Not that they have learned too much from books, but that they have learned too little from *experience*. Now, one great advantage of an agricultural paper is, that it makes my neighbors' experience mine. For example, ten, or more, individuals report in the Farmer, what success they have met with in growing a new variety of corn, potatoes, or any other crops, or new modes of raising them, that gives me the experience of these ten or more persons; and I may adopt that crop or that particular culture, or discard it, as the result of their experiments may have been favorable or otherwise, and that, too, with more confidence than I could with only a single experiment of my own. It is in that way that most of our valuable improvements have been introduced, and will be in future. And if we would keep up with those around us, adopting what is valuable, and avoiding what is worthless, in

the various real or pretended improvements continually offered to us—I know of no way of doing it so safe and effectual as by supporting, in the midst of us, a paper, in which all these matters shall be reported upon by those who have tried them—by those who cannot be deceived, and have no interest in deceiving others.

But there is another and still more important reason, why I wish to urge upon my brethren of the Plough, the support of this paper; and of this paper in particular. It is emphatically *our own paper*, located in the midst of us, and devoted to our interests—a native of our climate, and indigenous to our soil. Every reason which should induce us to cherish and support a local paper, of any kind, applies with full force to this.—Our portion of the State has obtained a high reputation for agriculture, at home and abroad; and we reap the advantage of it, in the increased demand for, and consequent increased value of, our farms. We are directly and deeply interested in supporting our high character; and in no way can we so effectually do it—abroad at least—as by a generous and efficient support of a Periodical, by which only we are known abroad. This is not theory—it is *fact*. We have tried it, and we know it to be so. When the Genesee Farmer was first printed, we were scarcely known abroad; and the value of our location was but poorly understood, and the richness of our soil but partially known. The issuing of that paper set the world right upon these points; and we were greatly the gainers by it. And now shall we lose all of that advantage, for want of a little timely assistance to this new paper, which has stepped in to take the place, which the removal of the old one has left vacant? If we do so, we shall certainly lose character and credit, and money, too. I say money, too, for there is not one among us, who is not interested in the success of this agricultural paper in our own vicinity, in a *pecuniary* point of view, as a mere matter of money. The cost of it is a mere trifle, what every one of us can afford to give, and for which we shall receive, in return, more than tenfold what it cost us, in the pleasure and profit of perusing it; it will save us from the discredit of having lost ground in agriculture, merely by the removal of the former publication—it will sustain our enviable reputation, as an agricultural district; and will say to the world, that neither the *farms* nor the *farmers* of Genesee, are too poor to support, what they were first in the State to establish,—a paper of their own.

Jan. 1840.

GENESEE.

For the New Genesee Farmer.

FRUIT TREES FROM CUTTINGS.

Messrs. Editors—I noticed in the Genesee Farmer under date of Nov. 2d., an article on the propagation of fruit trees from cuttings. This, like all other wonderful discoveries of the day, has been widely copied into the newspapers, both agricultural and political. It has had a wonderful effect; and there are those, in this age of improvement, who swallow with avidity, every humbug that appears in print, who are of the opinion that this new discovery will soon supersede the old slow and up-hill method of planting seeds, engrafting and inculcating, to obtain choice varieties of fruit.

Now, I shall hazard the assertion that the article alluded to is not of recent origin, and therefore may not be put down as a new invention under the sun. It was put forth long before one half of the world understood the meaning of the terms "*morus multicaulis*" or "*Chinese Tree Corn*." Indeed, the same article appeared in print in the spring of 1823,—nearly 17 years ago. I think I cannot be mistaken that it is the same, word for word. Being then, as well as now, engaged in the nursery business, I resolved to try the experiment. Accordingly I followed the directions laid down, and put in about 500 cuttings of the apple

and pear. It proved an entire failure—not one grew. As the ground had just been highly manured, and as the season had been rather dry, I attributed the failure in a measure to these causes. I resolved to make another trial; and the following spring selected a moist soil, and again planted out some 2 or 300. A few of them started and grew for a short time, and then withered away, not one of them having taken root. So much for this humbug.

I would here remark, that if writers on agriculture and horticulture, would merely state what they *know* to be *facts*, after a fair and full investigation; and not rely on their "no doubts," and "appears to do well," taken frequently from hearsay evidence, and often before experiments have fully tested them; much greater reliance could then be placed on their statements. Many experiments that appear to do well at the outset, prove a failure afterwards.

Grafting on the Wild Cherry.

Some three or four years since, I observed an article in the Genesee Farmer, stating that the cultivated cherry would not grow when inoculated or engrafted on the wild black cherry. Seeing no good reason why it should not, I determined to try the experiment. I procured and planted some of the seeds; they grew and produced fine thrifty stocks. A year ago last summer I had some of them inoculated from our best English cherries. I examined them in the autumn, and they appeared to do well. Last spring, I had some fifty or sixty others engrafted; they appeared to adhere finely, soon after pushed out their leaves and grew vigorously; indeed, they appeared to be doing quite as well as those worked on the stocks of the English Mazzard cherry. I then came to the conclusion that the story of their not growing on the wild cherry was all humbug. And had I possessed more leisure at that season of the year, I fear that I should have come out with a communication, stating my success in the experiment. But soon my grafts and buds began to wither, and before midsummer the most of them had ceased to be. Some few have remained green during the spring and autumn, but I do not expect to find one of them alive in the spring.

B. II.

Buffalo Nursery, January, 1840.

We esteem communications, such as the preceding, as not less valuable than the reports of original experiments. To establish the correctness or fallacy of written statements, is of great importance. A new mode of culture becomes of much greater value when the reader can know for a certainty that such mode can be depended on; and much needless trouble and expense may be saved by a timely exposure of impossibilities. With regard to the discovery alluded to by our correspondent, that of propagating fruit trees by cuttings, from the repeated failures we have known in past years, in similar attempts, we had concluded that it was long since given up, and were not a little surprised to see it come forth again, a few months since, as a discovery of great value.—*Eds. N. G. Far.*

MODE OF EXTRACTING WAX FROM HONEY COMB.

Have on the fire an open vessel of boiling water, and stand by the fire an open vessel of cold water; put the comb enclosed in the canvas bag, in the boiling water, and repeatedly squeeze it down with a stick or large wooden spoon; the wax will come through the bag and swim on the top of the water; skim it off and put it in the vessel of cold water; by repeatedly squeezing the bag and skimming, every particle of wax is obtained, when congealed it may be taken off and melted, and cast into moulds of any convenient shape for sale.—*Glasgow Mechanics Mag.*

A gentleman of Liverpool, it is said, has invented a steam engine that will perform the distance between Liverpool and America in six days.

He who receives a good turn should never forget it, —he who does one should never remember it.

From the New England Farmer.

FOREST TREES--THEIR IMPORTANCE --SOWING THE SEED.

MR. COLMAN.—When we witness the rapid diminution of the primitive forests of New England, and reflect upon the intense rigor of our winters, and the increasing demands upon our woodlands for other purposes than that of supplying fuel for an increasing population, we cannot but be anxious, in behalf of those who are to come after us, as to the from whence they are to derive one of the most necessary articles to their comfortable existence—their timber for fuel and other purposes. We are fully aware that our fears are deemed foolish by many, for they point us to our groves, whose "tall old trees" have long since passed away, and to our mountains, whose rugged sides and "airy tops" almost bid defiance to the vandal excursions of the axeman, and exclaim, "the growth is greater than the consumption." This, however, is not the fact: for our groves are hardly sufficient to shield parts and masses from a summer's sun, much less to protect them from the cold winds of winter, while our mountains are literally exhibiting the appearance of so many mighty Simpsons, shorn of their beautiful locks, with the Phobuses still gathering around to take the last remnant of their strength away.

We are led to these remarks by an inquiry in your paper of October 23, as to the best manner of sowing the seed of forest trees, a process which, if successful, we have no doubt may be profitably employed in covering many lands which are almost valueless for other purposes, with a growth of timber, the increase of which would give a rich percentage, and in a course of years become valuable in itself, and when taken off, leave the lands in good state for cultivation.

We know of no better way of aiding nature, than by observing her process and conforming our operations thereto as nearly as possible.

Hence when we see a forest spring up and grow rapidly, we may well examine the condition of the soil in which its rudiment vegetated.

We find on examination, that trees which spring up by fences have the most rapid growth of any in open lands. An obvious reason may be offered why it is so. Such places are usually the richest parts of our fields—quite too much so to allow them to be overrun with thorns and thistles, and their fertility continues to increase by leaves being deposited beside them, as long as the old fence continues. We give one example of a tree—an oak—which sprung up upon our own premises, and which, for our own convenience, we have sawn down to see the enquiry of your correspondent reached us. On examination we found it contained nine corded layers, and was fourteen and a half feet high. It must have originated in an acorn, as there is no similar tree in many rods. It must have been slightly covered, unless the squirrels buried it deep.—It had a fine light soil, which we deem important to the successful vegetation of all seeds.

Your correspondent enquires how chestnuts should be sown. We have never sown any, for we have a plenty of the timber without, and a prospect, with good management, of its continuation from self-sown trees. We can tell him how nature sows them. The land on which chestnut grows in the forest is generally light and free from grass and weeds. The fall of the fruit and leaf is about the same time, and from beneath its covering of leaves, the fruit, the next spring, sends us a new tree. We would not, however, recommend this covering of leaves in open fields, lest they blow away and leave the fruit bare, or if they remain, they become so dry as to prevent germination. A slight covering of mould must supply the place.

The lamented Judge Buel, whose praise is in the mouth of all good farmers, and who, though dead, still speaks, and I must long speak to us by the practical precepts he has given, says—(vide N. E. Farmer, vol. viii, page 161.)—"On the 25th of May, 1837, I repaired to the banks of the Hudson, with an assistant, and collected seeds of the soft maple, some species of the elm and of the butternut which were then tall— the latter of the preceding year's growth. They were planted the same day, very thick, in beds of mould. They immediately grew, and the plants attained some size that year. Last week [the article is dated Nov. 28, 1839.] I transplanted some of the maples for ornamental trees, which were from ten to fourteen feet high. Some of the butternuts were ten and the elms six or seven. This in thirty months from the time of planting the seed." Judge B. then goes on to state his process of planting out three hundred more of these trees, which he obtained from "a space less than six feet square," and transplanting them at a "space of about four and a half feet," to form a screen on the side of a field, which in fifteen years he proposed would do to cut for fuel, and would con-

sume to renew itself for the axe, by sprouts from the stumps once in fifteen years. He also stated that the expense of his trees thus far did not exceed \$3.

Your inquirer says that he plants his trees on grass land, some of which is dry and sold, the rest meadow,—all favorable to the growth of wood, large forests having grown there in time back.

Is it not probable that this land has become too sold? an event which will take place where long cultivation is followed by the exhaustion of the fine vegetable mould, which is important in accelerating the growth of young forest trees. Did not his thirty young trees of natural growth, in the north end of the field, start up while the land was new, perhaps by an old stump, or by an old fence, or did they start up in grass land?

If we wish to plant the seeds of trees of any kind, we should pursue the plan of Judge Buel—prepare us a quantity of good vegetable mould, of such size as we thought best, then we should gather our acorns, chestnuts and walnuts, or other seeds, when they fall from the trees, and sow them immediately and liberally, broadcast. At a suitable time we would transplant them—a ceremony which may be rapidly passed through, and we should be very sanguine of success. This may look to your inquirer like a roundabout way of getting to the wood, but we would rather take it than to meet with a disappointment similar to his, for in this way the trees starting from a soil congenial to their habits, would be healthy, which would enable them to push forth more vigorously in his land, dry and sold, than though they had originated there, plants of slow and sickly growth.

Since we are on the subject of trees, which it appears is quite a hobby with us, we ask leave again, as a suitable season for operation is now on hand, and as the hurrying season of the farmer is past, to call the attention of your readers to transplanting. Last spring we all paid our highway tax most cheerfully, in anticipation of smooth roads to pass over in our business and pleasure excursions during the season. We have been more than compensated for the few shillings set against us, by the luxury they have brought. Next spring the tax must be repeated—it ever has been and must be still, and it will be cheerfully paid as long as good roads are in repute.

We propose another tax, or rather a donation, for the benefit of ourselves and the traveller, which, if once well discharged, will need no reputation for ages—it is nothing less than transforming all our highways into beautiful avenues. And would each town in "Old Massachusetts" appropriate the same amount of labor in effecting this object which they have given this year to repair roads, the object would be accomplished, and "Old Bay" would set an example to her sister States in no way reprehensible of that which he set them in the days of the revolution. We are happy to see that in many parts of Berkshire, they are beginning with new zeal, especially to fill the meens and vacant places.—May the work become a contagion, and spread until it has extended into every lone and by-corner of our country. Yours truly, W. B.

Mount Oseola, Nov. 4, 1839.

By the Author.

Prospects of the Silk Culture in the U. States.

The close of the year, and the assurance upon a new one, presents a convenient point from which to take a view of some of the prominent subjects connected with the cultivation of the soil, which are engaging the attention of our countrymen; as, at each a time, we naturally look back upon the past, and from it form anticipations of the future. Among these subjects, there is no one of more absorbing interest at the time, than that of the Cultivation of Silk.

As there exists much inequality in the minds concerning the subject, and a doubt of our being able to produce silk profitably; and as it had been so extensively unawakened, by some who have deemed it "unmanly," and the whole matter "hooked up in the hembag," got up merely for the purpose of being "blown up" by designing men, it may be well to take an impartial view of the subject, and what has been done, not simply in the raising and breeding of trees, but in the growing and manufacture of silk, and from the practical results, as the only correct and safe criterion to form our judgement of the case.

The greater part of this incredulity arises from a want of information, and from that selfishness with which men are apt to view every enterprise. This distrust, this disposition to doubt, were far from censuring, provided there is at the same time, a mind open to conviction. It argues a becoming prudence and caution. But we do disapprove of this whole of condemnation of a thing without evidence, without even examination. There needs but the knowledge of facts, and an impartial examination of the subject of

the silk culture on its own merits, to convince every unprejudiced mind, even the most skeptical, not only that it is a branch of business from which may be derived great profit to those who engage in it understandingly, but one of great national importance. Many individuals who have been entirely skeptical, and the most strenuous opposers of the silk business, yielding conviction to the light of truth, are now its warmest friends and advocates, and are preparing to embark in it extensively.

To enter into a full examination of the subject, would require more space than can be devoted to a single essay, in the columns of an agricultural journal; and much as it would require the introduction of a multitude of statistical facts in relation to the silk business in our country. But a few of these we shall present for the consideration of the candid.

1. That silk can be raised with perfect ease, that our climate, from north to south, is admirably adapted to the constitution and health of the worm, far better than that of Europe, and to the growth of the Mulberry tree in its different varieties, has been satisfactorily proved by thousands of experiments. While in Europe, owing to the humidity of their climate, nearly one-half of their crop of worms usually dies from disease, and they are obliged to have their cocoonseries nicely regulated in their temperature by the thermometer, here, owing to the dryness and warmth of our atmosphere, with proper care, scarce a worm dies from disease; and a building of the cheapest construction—any out-house, shed or barn—answers perfectly well for a cocoonsery. That the silk made in this country, is of the very best quality, for fineness, lustre and strength, equal to any in the world, has been decided by competent judges. Specimens of raw silk have been sent to European manufacturers, and pronounced by them to be superior; and by our own manufacturers it is much preferred, and receives a higher price, by a dollar or two on a pound, than the foreign article.—There is no more mystery or difficulty in raising the worms, than in raising chickens; children, females, aged and infirm persons are competent to the work, and it requires no more skill to reel the silk from the cocoons, than any of our intelligent females may acquire with a little practice. Persons have succeeded perfectly well, even to the reeling and spinning of the silk into beautiful sewing silk, who never saw a silk worm or a cocoon before, and who had no other instruction than what they had derived from silk publications. If, then, abundance of the raw material, of the best quality, may be produced without any difficulty; what should hinder us from becoming a silk growing country, and from manufacturing it, not only into sewing silk, but into all the variety of silk stuffs used by our people; and thus save the millions which are annually drained from us, to pay foreigners for weaving and manufacturing our silk?

2. Silk may be raised with profit. There is no branch of business which yields so large profits on the capital invested and the labor bestowed. It requires, indeed, but a small amount of capital to go into it extensively; a few acres of land, a few trees to begin with, and the necessary fixtures for feeding worms. Hence it is admirably adapted to the small farmer, and persons of limited means. It is peculiarly of a domestic character, and may be pursued with profit in the family, employing the children and females, without detracting to the other branches of the labor of the farm. A practical illustration of this, we will mention a particular in one of our silk periodicals. A Connecticut farmer, the past season, "hatched out some worms to be attended by his three children, who were going to school every day, and they gathered leaves and fed the worm in the morning before leaving home—returned at noon to feed them again, and at night washed and rearing for the day. The worms had multiplied, and what was given by these children, and the silk, when reeled, was sold for one hundred and twenty-five dollars." This was more than the farmer made from an extensive dairy farm, (on which several crops were cultivated besides,) from any other one crop to which his attention was directed." That silk, from the common white European variety, may be raised with profit, has long since been demonstrated in Connecticut, where, in the town of Mansfield, originally one of the poorest agricultural towns in the state—the lands so poor and broken that our farmers would hardly take it as a gift, and be obliged to cultivate it—the culture of silk has, for half a century, formed the chief source of the wealth and prosperity of its inhabitants. Silks, to the amount of many thousands of dollars, has been raised in a single year. The farmers are above-board, out of debt, with money to lend; and their daughters have something comfortable laid by, to present their husbands, when they marry, as a marriage gift, in the form of money at interest, the product of their own labors.

her in feeding the silk worm, and reeling and spinning its tiny fibre. Why would not value such a wife, not only for her *soil cultivator*, but for her habits of industry, her spirit of independence, and her knowledge and skill in a branch of business which is destined to be the source of incalculable blessings to our country?

But the introduction of the Chinese Mulberry, (the *Morus alba*) into the Canton, has produced a new era in the silk business in the United States; and by its superiority over every other kind, and its rapid and extensive propagation and distribution through the land, is hastening the period when we shall be a silk-growing country. Its large, nutritious and abundant foliage, and the consequent great saving of labor in picking the leaves, (a saving of nearly nine-tenths,) and its immediate fitness for use, greatly enhance the profits of the silk culture. Plans have been entertained that it would prove too tender for our climate; but, placed on a high and dry soil, not very rich, it stands even our severest northern winters. But even were we obliged to take the tree up every fall, as we do a crop of potatoes, and plant again in the spring, it would yield an ample return of profits in the crop of silk. A field of *Morus multicaulis*, cultivated in this way, would require but little more labor than a crop of corn. The high prices which the tree has commanded have resulted from the conviction of its great value for producing silk. We are not in favor of making large estimates; but at the lowest, the profits of the silk culture with the mulcaulis, are ample—greater than can be realized from any other agricultural pursuit. By actual experiment, it has been demonstrated, that from 50 to 100 lbs. of silk may be raised from an acre of ground the first year, planted about as thick as you would plant corn or potatoes; at an expense of not more than \$2 per pound. This silk, reeled, is now worth \$5 per pound in its raw state, or \$10 if converted into sewing silk. Even at the past and present high prices for the tree, a very large per centage may be realized the first season, by the crop of silk that may be raised. An intelligent dealer in the *Morus multicaulis* has informed us, that he has made sales to a considerable amount this fall, at fifty cents a tree, on a credit, and that he had given purchasers the choice, either to pay the whole in money, or half the amount in money, and the other half in the crop of silk which could be raised the first year, by feeding as many worms as the trees would supply with leaves; the purchaser thus making fifty per cent. on his investment the first year. A number of sales of this kind he had made; and in one instance, the farmer—who had some experience in rearing worms—sitting down with his pencil and paper, and making a calculation, chose to pay him the whole in *cash*. The growing and sale of the *Morus multicaulis*, has by no means been all speculation. Large permanent plantations have been made for raising silk. Whatever have been the motives which have induced those who have gone into the business, it has resulted in good to the country; it has awakened attention to the subject, and excited a deep interest, far and wide, in our citizens; it has elicited much light and knowledge, experimental and practical; called forth the inventive energies of our people, in the construction and improvement of silk machinery, and by the rapid multiplication and diffusion of the tree which forms the food of the silk worm, is putting it in our power soon to be independent of Europe. We prophesy that in *ten years* we shall raise, if not manufacture, our own silk, and that in *fifty years*, raw silk will form an important article for foreign exportation; and thus, now our cotton, and thus without encroaching upon, or diminishing our other great staples. This end of, as now, being tributary to Europe, she shall be tributary to us, for the material which will form her finest and most beautiful silk fabrics; and the millions of specie which have been drained from our country—the life's blood of our commerce—to pay our foreign debt, producing national bankruptcy and ruin, shall flow back into our coffers, and circulate freely through every artery of trade, giving health and vigor to the whole. By some, we may be deemed visionary, and pronounced a false prophet. Be it so.—Whoever lives will see. Our anticipations of the future are not formed from *fancy*, but from *fact*—from a careful and attentive examination of the subject, and observation of the progress of the silk culture in our country. We judge of the future from a knowledge of the past—from what has already been done, and is now doing.

3. And *what*, it may be asked, *has been accomplished?* We answer, the *feasibility* and *profitableness* of the silk culture has been satisfactorily proved, as we have shown. Thousands, through the whole length and breadth of our country, have engaged, or are pre-

paring to engage, in the business. Immense numbers of worms have been fed with perfect success—the past season no less than 400 cocooneries have been erected, and preparations are making to feed worms on the most extensive scale the coming season; hundreds of acres will be planted with the *Morus multicaulis*, not for the purpose of speculation in the sale of the trees, but for *raising silk*. Societies have been organized for the promotion of the object, and recently a National Society, at Philadelphia, at the head of which are some of the most distinguished men in our country; Legislative bounties have been granted in several states, to encourage the culture of silk, and we trust our own will not be behind her sister states, in encouraging, by legislative aid, the noble enterprise.—Several manufactories have been established, and are a successful operation, producing fabrics which our wives and daughters need not be ashamed to wear, and which only want a supply of the American raw material, to rival the silks of Europe. With these cheering facts before us, is there not ground for the most favorable anticipations? Who that is acquainted with the genius and character of our people, for enterprise and perseverance, can doubt, that with the impulsive now given to the silk culture in our country, its onward course is to a high destination?

4. And is there an American bosom, in which dwells one spark of *patriotism* and *philanthropy* but that would most ardently wish this?

As statesmen and political economists, is it a *wisdom* in us to pay out millions to other nations for that which we can just as well produce ourselves?—To run in debt to Europe for a single article, to an amount far exceeding all our exports, with the single exception of cotton, 15 or 20 millions of dollars per annum;—to make the balance of trade against us, and thus impoverish ourselves to enrich others?

As *philanthropists*, can we do otherwise than give our best wishes and cordial aid to a branch of industry which will give employment and a comfortable support to thousands in our land, whom poverty, misfortune, age and infirmity have placed in necessitous circumstances; to the children of the poor in our large towns and cities, who are growing up in idleness and vice; to females who are dependent upon the painful and precarious labors of the needle for a scanty subsistence; and to the aged and infirm, who are disqualified for more laborious employment? In the just language of the editor of the *Silk Farmer*, "In all our large cities, where female suffering is the most intense, and every eye averted toward it in our widely extended country, the blessings attendant on the progress of the silk culture, will fall with grateful beneficence upon this dependent and neglected portion of our population. A child of twelve years old, or an aged person, unable to follow any laborious employment, will attend during the feeding season to as many worms as will make *twenty-five pounds of raw silk*. The same individual will reel a pound of silk per day. Count the number of this reeling to his own imbecile and destitute family—some widow with a numerous group of suffering children—to whom a domestic employment of this kind would indeed be a blessing? Or some lonely and aged female, too feeble for labor, too good for the poor-house, who in a steady and subsiding occupation at the silk-reel, might lift up into the sun-shine of grateful independence? Considerations of this kind excite the sympathies of the human heart, and make the subject as interesting to feeling and philanthropy, as it ought to be to private interest or commercial enterprise."

There is but one point more on which we wish to offer a remark; and that is, *the benefit that would result to the silk culture, by laying a duty on foreign silks*. This benefit would immediately be felt; it would give a new impulse to the silk business, check the influx of foreign silks, and therefore prevent the draining of the country of its money—enable our manufacturers to compete with those of Europe, and establish the silk culture on a firm and unshakable basis. It is certainly the true policy of a government to cherish its home industry, to encourage its own manufactures, by protective duties. We hope that Congress, consulting the true interests of the nation, will take the subject in its early consideration, and lay at least a moderate duty on foreign silks. In the mean while, let the friends of the cause make known their wishes, by memorializing that honorable body to whom is confided the interests of the nation. With this remark, we leave the subject to able pens; hoping that, though we may not have thrown any new light on it, nor convinced a single skeptic, we may at least have presented the subject in such a view as to ensure the favorable consideration of all.

W. W. B.

Hammondport, Dec. 3, 1838.

RULES FOR HOUSEWIVES.

1. When you arise in the morning, never be particular about punning your clothes so very nicely; you can do that any time.

2. Never comb your hair, or take off your night cap till after breakfast. It is your business to take time to the foretop and not let it take you so; there to keep all night in that quarter, till 10 o'clock at least.

3. When you begin the business of your toilet; you may do it to the window, or in the entry; but the most proper place is the kitchen.

4. Never have any particular place for any thing in your house; and then you may be assured, that nothing will ever be out of place; and that is a great comfort in a family.

5. Never sweep your floor until you know some person is coming in; he will then see how neat you are; and, besides, in such cases, even your enemies cannot shake off the dust of their feet, against you, though they may the dust of their clothes, with which you have covered them by your sweeping.

6. When you have done sweeping, leave your broom on the floor, it will then be handy; and being always in sight, and in the way, it will be constantly reminding your husband, when he is in the house, what a smart, nice, pains-taking wife he has.

7. Never throw the barbarous practice of brushing down cob-webs. A man's house is his castle; and so is a spider's;—it is a violation of right, and a chronic's disrespect to the fine arts.

8. Keep your parlor and bedroom windows shut as close as possible in dog days; this will keep the hot air out, and you will have excellent fixed air inside.

9. Keep your summer chaises in your bed chambers;—they enrich the qualities of the atmosphere; and if a stranger should lodge in one of your beds, if he could not sleep, he could not for his refreshment.

10. Never touch your daughters to mend or make any of their own cloth; it is taking the bread from the mouth of labor;—besides, it will make them crooked, and give them sore fingers.

11. But if they should insist on mending their garments, they should do a whole day's work; this will make them fit better; and girls can't leave their work; if they should attempt it their work would follow them.

12. If your husband's coat is out at one of the elbows, don't mend it until it is out at the other; then the patches will make it appear uniform; and show that you are impartial.

13. Never spoil a joke for a relation's sake;—nor suppress the truth for any body's sake.—The more, if you don't like your husband as well as you ought,—*out with it*, and convince him you are not a respecter of persons.

14. You should endeavor not to keep your temper; let it off as soon and as far as you can; and then you will be calm and quiet as a bottle of cold water the cock had been drawn half a day.

15. If, on any particular occasion, you are at a loss, as to the course you are to pursue, in the management of yourself or your family affairs, take down the paper which contains these rules, and read them over and over till you have satisfied your mind;—and then go on.

POOR RICHARD.

Two FAULTS.—A gentleman once bought a horse of a country dealer. "Now, my friend," said he, "I have bought your horse because I liked his appearance. I asked you no questions. Tell me now his faults, you know I have paid you;—therefore you have nothing to fear." "Faults," replied the man, "I know of no faults except two.—'What are they?'" "Why, sir, he is hard to catch." "I do not mind that," said he, "if he be the devil. But what is the other fault?" rejoined he, with some impatience, "Ah! sir," replied Hodge, scratching his pate, "he is good for nothing when you have caught him."

From the *Farmers' Magazine*.

TO DESTROY WEEVILS IN GRAYNARIES.—See in your paper an enquiry respecting the destruction of weevils. I send you a copy of a paragraph which has been cut out of some publication. It is as follows:

"Accident has discovered to a French farmer a very simple mode of destroying weevils in corn warehouses, happening to lay in the corner of a granary in which there was a quantity of corn, some sheep skins with the fleeces on, he was not a little surprised to find them, a few days after, covered with dead weevils. He repeated the experiment several times, and always with the same success. At last he ordered his corn to be stirred up, and not a single weevil remained in it.

I remain Sir, Yours,

A CONSTANT READER

NEW GENESEE FARMER.

FEBRUARY, 1840.

OUR ENCOURAGEMENT.

Since issuing the first number of the New Genesee Farmer, we have received a large number of able communications, on the subject of our undertaking, from the friends of the cause in this section; all expressing the warmest approbation of the course we have pursued, and promising us their aid and influence. We cannot but feel highly gratified by these communications, even though we may not deem it advisable to publish them. We regret the necessity of occupying any portion of our columns with matters which may appear to relate to ourselves more than to our readers; but the circumstances under which we are placed, render it necessary that some of these communications be given to our readers, in order that they may rightly understand the subject. We therefore commend to them the articles signed 'Genesee,' and 'Monroe,' and the following one from C****. They contain interesting facts, and considerations of great importance to every farmer in this section of country.

We commenced the publication of this paper, at a time of the most severe pecuniary embarrassment, and when we had little time or opportunity for making our intentions known to the public. At the same time, those whose interests were opposed to the enterprise, were using all their influence against us, and doing all in their power to excite universal suspicion and prejudice against any attempt which might be made to establish such a paper. We are sorry, that we, or our correspondents, should be obliged to say any thing which may appear to censure those, for whom we always did, and still wish to, cherish the most friendly disposition. We do not intend to feel ill-will ourselves, or excite it in others; and for this reason, we have omitted, entirely, several communications on this subject, and taken the liberty to strike out a part of others. We hope our correspondents will forgive the liberties we have taken, and let us hear from them again soon, on more practical subjects.

To the Editors of the New Genesee Farmer:

GENTLEMEN,—When Mr. Tucker announced that he had not only bargained himself away, but that he expected to transfer the patrons of the "Genesee Farmer" away from their "Genesee Country," and the "Holland Purchase," even unto the tide waters of the Atlantic; I told my neighbors I did not believe that he would succeed; his patrons were too proud of their locality and their name, to be willing to make the sacrifice, merely for the sake of increasing his profits. I told them, there would be a new paper started immediately; that the subscribers to the old paper, generally, would enrol their names as its patrons; and that, in fact, we should see no material change, except perhaps an alteration in the name, Vol., No., &c., of our paper.

Hence you will conclude I was more gratified than surprised by the appearance of your first number.—My object in taking up my pen, is to congratulate you, and bid you a hearty "God speed," in an undertaking which, I doubt not, will result in a mutual benefit to yourselves and the agriculturists generally of Western New York; and, indeed, I may say of the Western World.

Don't be discouraged, if your subscription list, for the first few months, should fall short of your expectations. Consider that the acquisition of 18,000 subscribers to any periodical must necessarily be a work of time: the great majority of the farmers will not, in some months, even hear of your paper; and in the mean time some of them will have subscribed for a paper, which, while it will cost them double price, will be worth less money. These must "bide their

time," and of course you will not get many of their names on your list till next winter. Again, money is so extremely scarce, that, to my knowledge, many substantial farmers are reluctantly forced to adopt the rule to "pay no money except to cancel their debts, and procure the indispensable necessities of life."—But this exigence, we hope, by dint of industry, economy, and frugality, will soon be overcome; and that you will (performing your duty on your part) ultimately attain an extensive patronage, I believe, for the following reasons:

1st. We want, in Western New York, a periodical through which we can conveniently, (without unnecessary loss of time and postage,) exchange our views and sentiments upon, and the results of our changes and experiments in, the business of our profession; a paper, which, in connection with the Rochester Seed Store and its proposed Museum, will form a valuable repository of agricultural knowledge and improvement. This repository in all its departments should be chiefly made up from our soil and climate; for farming in the Genesee Valley, and farming in Albany county, are very different things.

2d. The difference in price is an important item in favor of your paper. Does Mr. Tucker, after having been nine years constantly engaged in teaching us economy and frugality,—and that too in small matters,—think we are so stupid as to be induced to pay a dollar for an article which will but indifferently answer our purpose, whilst we are offered exactly the thing we want for half a dollar?

3d. Your Price Current is a decided improvement upon the old paper. Let this be carefully and correctly made up, accompanied with such editorial remarks, illustrations, and advice, as circumstances may require, and, to farmers generally living from 20 to 50 miles from Rochester, this alone will be worth more than the whole cost of the paper. C****

Ontario Co., Jan., 1840.

EXTRACTS FROM CORRESPONDENCE.
Red Root, in Clover Seed.

MESSRS. EDITORS—As the time for buying and sowing clover and grass seed is at hand, permit me to raise a warning voice, for farmers to beware of sowing foul seeds on their lands, especially that of Red Root.—I consider this weed a much worse enemy to the wheat grower than even the Canada thistle. It has already obtained a lasting foothold on some good wheat farms in this section, to the great detriment of the crop, and, in my estimation, reduced the value of the land about one half. For, when the ground once becomes seeded with it, it is next to impossible ever to get rid of it; as the seed is produced very abundantly, and is of such an imperishable nature, that it will lie dormant in the ground for years till a favorable opportunity presents, when it will spring up and seed again most plentifully. The seed is rather larger than that of clover, of a brown color, nearly round, rough and very hard. Any person acquainted with it will readily detect it in clover or grass seed; but those who have never seen it would not be apt to observe it.

MONROE.

January 25th, 1840.

NOTE.—We wish Monroe, or some other person, would leave a few seeds of the Red Root at the Rochester Seed Store for exhibition. We had a sample, but it has been mislaid.—Eds. N. G. Far.

Preventive of the Hoof Ail in Cattle.

A correspondent adds the following P. S. to a letter:—

"Much complaint has been made, for several years past, of the prevalence of "Hoof Ail," among the cattle of my brother farmers. My cattle have entirely escaped this disorder, and I attribute their exemption to a practice which I have adopted for several years

past, of feeding them late in the evening during severe weather, with plenty of good hay; so as to keep them stirring during as much of the night as possible. I have fed all kinds of hay, from that of newly stocked Timothy and Clover, to that of June grass from meadows which have been mown twenty years in succession. I truly believe my practice is a sure preventive, and if you think it worth mentioning in your "New Genesee Farmer," it is at your service."

A FARMER.

Amber, January 25th, 1840.

Mangel Wurtzel—First Attempt.

MR. A. RAPPALJE, of Ontario county, informs us that he planted a small patch of Mangel Wurtzel last spring, for the first time. The soil was a heavy loam, inclining to clay. The ground planted was little more than one eighth of an acre, and the produce was one hundred and fifty bushels. Some of the roots weighed 15 to 18 pounds. Mr. R. feeds them to his milch cows, and thinks them highly beneficial. He intends to plant a much larger quantity next season.

Carrots as Food for Horses.

MR. GEO. SHEFFER, of Wheatland, called at the Seed Store, a few days since, and gave us some account of his success in the culture and use of roots, for stock; particularly in feeding horses on carrots.—He raised last season, beside other roots, about 300 bushels of carrots, which he feeds mostly to three working horses, giving them one bushel each per day, together with hay. He has fed them in this manner nearly three months steady, and kept them at work most of the time. He formerly fed his horses half a bushel of oats each per day, with hay; and from the results of his experience, he is fully convinced that one bushel of carrots is worth as much for horses as half a bushel of oats. His horses eat much less hay than when fed on grain, and keep in as good order, and appear as well able to work. He thinks that horses fed on carrots, with a small quantity of oats and hay, will do better than when fed on oats and hay only.

* We should be happy to hear from Mr. S. whenever he can make it convenient.

ENQUIRIES, &C.

We are pleased to find that many of our readers rightly understand the use of an agricultural paper.—We like to see them not only free to communicate to others any information which they may possess, but also free to ask from others in return, any information which they may desire. A question asked thro' this paper will meet the eye of thousands of farmers and be most likely to receive a proper answer. Information may thus be obtained of great benefit to the community, and which otherwise would have been lost, or known only to a few.

We hope all of our readers who possess the requisite information, will feel called upon to answer any questions which may appear in our columns. Answers to the following are desired in our next number:

The Taste of Turnips in Milk.

MESSRS. EDITORS—I raised a small quantity of Ruta Baga and Sugar Beet the past season, for feeding milch cows in winter. I fed with Ruta Baga a short time, but the milk and butter partook so much of the flavor of turnips, that I had to abandon them and feed my Sugar Beets. The milk has since been sweet and good; but if you can inform me how to feed my Ruta Bagas and prevent their affecting the taste of the milk, you will perhaps oblige many other subscribers besides. A. K.

Orleans County, January, 1840.

Lime as Manure for Wheat.

MESSRS. EDITORS—I received with pleasure the first number of the New Farmer, and for one, will acknowledge the truth of the assertion made, that we do not fully understand the culture of wheat. I believe that this crop may be greatly improved, at least

as far as my practice is concerned. My object in writing at this time is, to ask one or two questions respecting the use of *Lime*. I believe it is generally admitted that its presence in the soil is necessary to the perfect growth of wheat. Now I would ask what is the most simple and easy method of testing soil, so as to ascertain whether it contains any, or a sufficient quantity of lime? Does all land in limestone countries contain as much lime as is advantageous; or, what experiments, (if any,) have been made to ascertain the effects of applying lime as a manure, on limestone, or other lands in this country? These questions may appear to open an extensive field for remarks, but I think their importance is so manifest that no apology is necessary for offering them through the (wheat growing) Genesee Farmer. SENECA.

January, 1840.

Large and Small Clover.

MESSENGERS. EDITORS—Can you inform me why it is that farmers generally do not sow the large kind of clover in preference to the smaller kind? I consider the larger variety of much greater value to wheat growing farmers than the other. I would also enquire whether there are more than two kinds in cultivation in this section? I often hear mention made of a *small*, and a *medium* kind, but I could never discover that there was in reality any difference; they both grow alike with me, and if they do not with other people, I should like to be informed of it. W. G.

Wheatland, January, 1840.

Making Beet Sugar.

Many persons, in different parts of the United States, planted the Sugar Beet last spring, for the purpose of commencing the manufacture of Beet Sugar. But we have not heard of any experiments being made, this fall or winter, in this business. Large quantities of the seed were sent from the Rochester Seed Store, to be planted in the State of Michigan; but we have heard nothing of the results. Will not some friend here, or elsewhere, send us some information on this subject?

Merchant's Drill Barrows.

The proprietor of the Rochester Seed Store sold, during the past season, a large number of "Merchant's Drill Barrows." One kind for sowing Ruta Baga, and other small seeds; and another kind, a little different, for sowing both large and small seeds, especially Angel Wurtzel, or other Beet Seed. He wishes some who have used them would inform him whether they answer the purpose, and give general satisfaction; or order that he may know whether to recommend them to his friends or not.

Our Paper and the "Cultivator."

Some of our friends have asked us whether we intend to make any selections, for our columns, from the Albany "Cultivator." Our answer is, we intend to make a paper, which shall be better adapted to our soil, and more valuable to our farmers than any other. And for this purpose, we shall select such articles, from the whole list of agricultural papers, as we may think most valuable to our readers. At the same time, as some of our readers are also readers of the Cultivator, they need have no fears of our occupying much space, with selections from that paper. On the contrary, we would advise those of our friends, who can afford it, and have the time and taste for the study—all who wish to become theoretical and scientific farmers, to take that paper as well as our own. The science and practice of agriculture cannot both be taught in one monthly sheet; and the two papers together, will not cost as much as the former weekly Genesee Farmer, or almost any other agricultural paper in the country.

AGRICULTURAL IMPLEMENTS.

Gilson's Root Slicer.

A machine for cutting roots is much needed at the present time. The above is the best one for the purpose we have ever seen. It will cut all kinds of roots with ease and despatch, without regard to size or shape. The above cut represents the machine with the hopper taken off. The plan and size of the hopper is represented by dotted lines above at *b*. At the bottom of the hopper is an iron barrel or cylinder (*a*) of a conical shape, 9 inches long, 6 inches in diameter one end, and 8 the other, formed of four separate staves or segments, on one side of each of which are knives, as shown at the top of the letter *a*. The shaft, on which is the crank and the fly wheel, passes through this barrel and turns it. The roots rest upon the barrel, and as it revolves, the knives cut slices off the them, which pass through between the staves into the barrel, and fall out at the large end (which is open) into a basket or box placed below.

Gilson's Straw Cutter.

No agricultural implement has of late years more severely taxed the inventive genius of man, than the Straw Cutter. Every year and in every place, we hear of some real or pretended improvement in this machine: until some have almost expected them to cut without labor, and feed cattle without fodder.—The above machine will not quite do this; but from our own observation, and the testimony of disinterested persons who have tried it in comparison with other highly approved kinds, we have no hesitation in saying it is superior to any other machine for the purpose now in use. In addition to its durability, and ease, and rapidity of execution, it possesses the following advantages, which many others do not:—

1st. It is so constructed that by turning a crank it feeds itself, and cuts a uniform length; 2nd. By shifting small gear wheels, the length of the cut is altered: the lengths usually applied are three, viz: one inch, three-fourths, and half an inch: but can be con-

structed so as to cut any required length; 3d. It is so constructed that the *cutting knives* can be taken off and ground, or otherwise sharpened, and again replaced with ease and precision.

☐ This and the foregoing machine may be seen at the Rochester Seed Store. (See advertisement.)

A Visit to Mrs. Langworthy's.

In our last, we promised a visit to Mrs. Langworthy. We always mean to keep our promise with the ladies: accordingly, a few evenings since, we stepped into a sleigh, with one of the fair daughters of N. England, who never refuse a sleigh-ride, and were soon bounding our way over snow-drifts and 'pitch-holes,' as lightly as a snow-bird in a fair wind. Render, did you ever go on a sleigh-ride, with a sprightly horse and sprightly companion, amid snow-drifts six feet high? If so, you most likely, like us, had a delightful *upset* on the way. These Yankee girls are no cowards in sleighing time. And what rare sport it is, when, in passing a team, or turning a corner over you go; girls, cushions, and buffalo skins, together into the snow drift! Half dead with laughter, you pick up your fair companion,—all is righted, and on you go again. What a happy illustration of our correspondent's remarks on the "beneficial constitution of Snow"!

We soon reached the residence of our friend, H. N. Langworthy: situated near the banks of the Genesee, about three miles north of this city. The rural cottage is one of the remaining tenements of the Pioneers of this country. Its log walls, whitewashed on the outside, and its snow-covered roof, render it hardly discernible amid the ocean of snow which surrounds it. The inside is the picture of neatness, comfort, and contentment. It is well furnished, and carpeted, and the walls neatly papered. We had not long been seated by the comfortable fire, before the social table was spread; and we sat down to a repast, which would make any true American "Bless his kind stars, and ask no richer fare." We do not claim to be native born, but we do profess to have a cultivated taste for such things, which entitles our opinion to some weight; and to say nothing of the peach sauce, molasses, and other "fixens," the Johnny cake, and hot pan-cakes, were certainly superior to any thing of the kind we ever before tasted. These luxuries were prepared from the meal of the Tuscarora Corn, mentioned by Mr. L. in our last paper. As was then intimated, Mrs. Langworthy has furnished us with directions for preparing these articles, which we give to our readers.

To make light Johnny Cakes, and Indian Pan Cakes.

Take two parts of Tuscarora, or other fine corn meal, and one part of wheat flour; mix up with butter-milk, or good sour milk, slightly warmed, adding a little salt. Mix rather thin for Johnny cakes or bread, and thinner still for pan-cakes. When ready to bake, add a heaping tea spoonful of saleratus, dissolved in water, and stirred in. It will immediately ferment, and should be baked without delay, taking care to bake thoroughly if thick. If butter-milk or sour milk is not at hand, water may be used, and before adding the saleratus, add half a tea spoonful of tartaric acid. Or, if preferred, yeast may be used instead of acid, observing to allow it time to ferment and become a little sour, (a little of the batter left over the previous day, will answer as well as yeast,) then add the saleratus as mentioned, just before baking, and the cakes will be very light, sweet, and wholesome, especially if made from the Tuscarora or flour corn.

A Correction.

A small but inexcusable blunder was made on the other side of this sheet, which we hope our readers will correct, and our esteemed correspondent forgive. In the article on page 26, headed "Observations on Snow," last line of the 3d paragraph, the word printed "unchanging," should read "exchanging."

LONDON'S SUBURBAN GARDENER.

This most fascinating work, which is one of the latest from the author's pen, should be in the hands of every person who possesses any taste in gardening or rural affairs. It is a large octavo, and comprises the details of a suburban or villa residence, or of a situation on which to form one; the arrangement and furnishing of the house; the laying out, planting, and general management of the garden and grounds; the whole adapted to grounds from one perch to fifty acres and upwards in extent; and intended for the instruction of those who know little of gardening and rural affairs, and more particularly for the use of ladies."

This work is unlike the Encyclopædia of Gardening, in being exclusively of a practical nature. It is neither historical nor statistical, nor physiological, any farther than a strictly practical work should be. It is not, however, a mere body of rules, which the reader is to follow without knowing why he does so; but the reason of every operation is given, and the principle on which it depends accompanies every direction.— What the author promises in his introduction is well fulfilled:—"It is our intention to endeavor to give our readers a more intimate knowledge of the subjects treated of, than has hitherto been attempted in works of this kind. Instead of a mere didactic calendar, or a dictionary of plants to be cultivated, directing what works are to be done in each month, or what operations are to be performed in the culture of particular plants or trees, we shall endeavor to convey such a notion of the structure and nature of a plant, as to show the necessity and advantages of cultivating it; and such an idea of the nature of soils, as to show the improvements which may be made in them, by mechanical operations, and the application of manures. We shall treat of the various operations of gardening, whether performed on plants, or on the soil; and for the performance of every operation, from the most mechanical, to the most scientific, we shall assign a reason. Let not its reader be alarmed, however, lest we should go into minute scientific details, only capable of being understood by the botanist and chemist, or by the professional gardener; so far from contemplating this, our intention is to confine our eyes to the simplest and most important features: to treat every subject in such a manner as to be understood by those who have little knowledge of either gardening or country affairs."

It is impossible that a person so well versed in the principles of domestic economy, and of ordinary and ornamental gardening, should not render himself interesting and instructive to the reader;—one whose whole soul is in the subject, cannot fail to impart to others the same fondness for the delightful pursuit of which he treats; and no one, who is not naturally destitute of all taste, can read this book without becoming deeply interested in the employment of gardening, and without adding to the correctness of his discrimination, both in its useful and ornamental departments. The style of the author, as is well known, is entirely plain, and sometimes, far from being pleasing; as for instance, the elegant reputation of ideas on the third page; but his great strength lies in planning and executing works of *niceness and utility combined*—in this respect the work is an inexhaustible fund for profit, taste, and economy; for while he points out the best mode of laying out and planting the grounds of the most wealthy, where cost is no consideration, he no less gives directions for the ornament of the smallest front yards and gardens, and with a particular view as to expense. Even the mode of erection of the clothes lines is not forgotten.

We must, however, strongly enter our protest against the practice, approved by the author, of placing in gardens and ornamental grounds, statues of pagan deities; it must be perceived in reality, which delights

to contemplate characters, who, as an eccentric person observed, had they lived in modern days, "would have been tried at the Old Bailey and executed at Tyburn."

We consider this work as more peculiarly adapted to this country, not only from its general character, but because, being confined to suburban grounds, it necessarily relates to those of limited extent; for no one, who feels any sympathy with the spirit of our republican institutions, can ever wish to see here the immense domains of the nobility, kept in the highest state of finish, at an enormous expense, supplied by the hard labor of hundreds of oppressed and industrious poor.

We are promised a second part to this work, to be entitled the *Suburban Horticulturist*, which will embrace all the departments of the cultivation of the suburban garden.

We close our remarks with the observation, that we think every person *who lives in a house*, may read this book to great profit. We hope hereafter to give our readers some extracts from the work.

OBSERVATIONS ON SNOW.

Winter is upon us. The earth looks like one wide waste; when will nature wake into life again? No pulse of vegetable existence seems to move; yet, its mighty Author holds all its organization ready for high activity at the call of his voice. Now, the earth is wrapped in the covering prepared for all the colder regions. Snow, what a curiosity it is; how beautiful its forms, how useful in its place, how beneficial to the labors of men.

1. Its *curiosity*, congealed water, solidified but expanded water; how it sifts down from its great factory in the sky. Its *color*; why is it *white*? why was not it *black*, but that it would have been a true poll spread over nature, too dismal, too repulsive, to be endured. How *small* are its flakes, so as to be borne on the breeze, and not to bear down by its weight the vegetable world by its power of accumulation. But its *whiteness*, who has explained? Even the wisest has only said, because it was so formed. How *easily* too it changes to water. Yet it requires so much of the matter of heat to effect the change, that it slowly disappears, and the desolation of great and rapid floods from the dissolving snows of spring or winter, is prevented.

2. Its *form*. Have you watched it, and noticed its various and beautiful shapes? At one time snow takes the form of a *star* of six delicate rays, equally distant from each other, or including an equal angle, and of equal length. At another time the ends of the rays are *forked*, and at another, small rays diverge from these principal rays at the same angle, and sometimes these divide again, all at the same constant angle. Sometimes two flakes are united by their opposite rays, so as to form a beautiful object with a pinnate or wing-like form. Sometimes it is a small ball, nearly a globe, or uneven, or with rays projecting at the angle already mentioned, sixty degrees, (at which angle water always begins to crystallize as congelation takes place;) or with these radiations on the balls, more or less pinnate. The stellated form of snow, sometimes has the end of the rays divided into three parts.— Sometimes the space between the rays is filled up entirely, and a flat, thin flake of ice falls like snow; and sometimes only as a single crystal in the form of spicule. How singular, that attraction, or electricity, or any agency, should arrange into these beautiful forms the fields of vapor in the unstable and unchanging atmosphere.

3. The advantage of snow, as a covering to the earth in winter, is most obvious. When it lies at any considerable depth on frozen ground, the internal heat of the earth melts the frozen crust, and the way is prepared for the water of the dissolving snow to pass into the earth and supply the springs with pure and wholesome streams.

Snow is a poor conductor of heat, and hence it forms a protection to the earth; the cold of the atmosphere has no effect upon the earth, and is confined to the atmosphere. Hence the roots of vegetables, and especially of winter grain, and of the valuable common grasses, are less liable to injury. The functions of organization are interrupted for a shorter period. The roots, too, are not so much exposed to be torn and injured by the expansion of the water, as it freezes at the surface of the earth, or soil. The great expansion of water as it congeals, takes place at the point of congelation: as the cold of ice increases, it contracts like other bodies. When roots freeze in the earth and with the earth, they would not be lacerated if they could expand with the expanding ice; but when they are confined by frost in the earth frozen, they cannot contract as the earth contracts, by the increase of cold. This result is, to a great extent, pre-

, by confining the cold chiefly to the atmosphere by the covering of snow.

cultivated fields, snow is a more important protection from the cold of winter than to the forest, as it is itself a covering to the earth. While cultivation thus removes the natural covering and protection of the earth, the exposure is counteracted by sowed fields becoming warmer from the more action of the sun upon them, and their temperature is not reduced to freezing till about the period the covering of snow is spread as a broad mantle over the earth.

vision is thus made too, for those animals and plants which must bury themselves for winter quarters below the reach of frost, that the depth may not be greater than their nature may require or than their means be able to penetrate.

re the depth of frozen earth far greater than the depth of snow permits, it would be long and late in thawing before the surface would be thawed and fitted for renewing the beauty of spring. The late season makes the spring later than in the woods; and the ground would be still later without the protection of snow.

easy and pleasant travelling and performing the necessary business of winter, the beneficial season of snow is palpable. If the snow were not on the earth, the transaction of business is more happy on the snow than on the frozen ground. The earth, iron-bound by frost, seems too, even more dreary than when clad in the cold covering of snow.

In the long winters of more northern climes, the contrast is even more striking. Communication is almost suspended between the inhabitants of the north and the south, and the aid which this mantle presents.

In all these respects, snow is a subject of interest and importance. Its constitution is wonderful; its adaptation to the condition of earth and its inhabitants, the wonder-working benevolence of that mighty power which "giveth snow like wool," and whose works are shown by "fire and hail, snow and vapor, wind fulfilling his word."

Thoughts more than reconcile us to the storms of winter. The earth is now covered with a mantle of snow, about two feet deep. But it is resting and reviving under the protection, while the noise of industry and the smiles of industry and the happy faces enliven the air, and happy faces enliven the air.

READING LONG MANURES.

Knowledge of some general principle is necessary to enable the farmer to prosecute, with success, any of the most important branches of his business. The correctness of this remark is demonstrated, in the successful application of the different kinds of manure.

It is well known they cannot communicate nutriment to the plant, without going into a state of solution, for which water is the agent. So far as the plants are supplied by the soil, it appears very plain that it is imbibed by the extremities of the roots.

For it has been discovered that the portion of manure which is soonest exhausted, is precisely that in which the greatest number of the extremities of the roots lie. If those extremities are cut off, the root ceases to grow in length; but the sides send off fibrous roots which perform the functions of roots, and imbibe nutriment by their extremities. It appears, then, that the element derived from manure, must first be dissolved by the moisture of the soil, and afterwards, in contact with these extremities, to assist the plant in the solution of the manure. Hence, the application of undecomposed vegetable manure, as straw, cornstalks, &c., and mixed with the soil as effectually as is practicable, with the plough or harrow, will contribute less to the value of a crop than many suppose. Following account, by a distinguished author, de-

velops facts relating to this subject, which may be of much practical utility.—It appears, says he, from the experiments of Mr. Hasseltius, that substances employed as manures, produce effects in times proportional to their degree of putrefaction: those substances, most putrid, producing the most speedy effect, and of course, soonest losing their efficiency. Having manured two pieces of the same kind of soil, the one with a mixture of dung and straw, highly putrified, the other with the same mixture, newly made, and the straw almost fresh, he observed, that during the first year, the plants which grew on the land manured with the putrified dung, produced a much better crop than the other; but the second year, (no new dung being added,) the ground which had been manured with the unputrified dung, produced the best crop. The same thing took place the third year, after which both seemed equally exhausted.

Some farmers in our country are so well aware of the importance of preserving and properly depositing long manure, as straw, cornstalks, &c., that they cause it to be placed in the furrow by one who follows the plough, so that it is entirely covered by the succeeding furrow; and then harrowing it lightly and thoroughly with the furrow, so as not to disturb the manure.—But too many are in the practice of carrying their manure into the field in an undecomposed state, and after ploughing and harrowing finished, to leave a large portion of it uncovered. After the process of seeding is finished, the straw and other coarse fibrous substances, are often seen scattered on the surface, having been either pulled out by the harrow or never buried by the plough. Not only is such manure often thus carelessly and inefficiently applied, but great quantities of it are permitted to remain around the barn, or put into large stacks, and left to evaporate by constant exposure to heat and moisture, till it has lost its efficacy in vegetation.

INDIAN BUCKWHEAT.

A good deal was said, a year or two since, about this new variety of Buckwheat; but for some time past we have heard but little respecting it. The following account will be interesting to most of our readers.

Messrs. Editors—I have cultivated the Indian Buckwheat for two years past, and will give you the results of my experience. In the summer of 1838, I purchased two bushels of the seed from Mr. Charles Bullis, of Macedon, who brought it from Vermont, where, he said, it produced from seventy to eighty bushels to the acre. I sowed it about the 10th of June, on a piece of poor, sandy, gravelly soil. It grew freely and hid fair to produce well; but, it was sown too late, and an early visit from Jack frost, nearly destroyed my crop. I harvested it, but the grain was much injured, and the flour made from it was bitter and unfit for use.

In harvesting the grain some of the ripest of it was shelled out and scattered on the ground, and the next spring I observed that it was not injured by exposure during the winter, but remained sound and fresh on the ground. Some of it beginning to sprout, I took the hint, and, accordingly, early in June, I ploughed in about an acre, where the previous crop had ripened the best; and in a few days, there sprung up a fine crop of young buckwheat, without any sowing. It grew much too thick, but ripened in good season, and yielded fifty bushels of seed.

I think this is a profitable crop to raise, but it requires to be sown earlier than the common sort. It is not injured by the heat of summer, like the other kind, and it requires longer time to come to maturity. It is necessary to observe, also, that it should not be sown where it is to be followed immediately by wheat

or a spring grain crop, as some of it will shed out in heavy stubble, and spring up with the following crop.—The best way, to sow it where it will be succeeded by a fallow, or by grass.

I am now using, in my family, the flour made from this grain, and consider it quite as good as the common kind. It is less liable to be gritty, as it is not so apt to pull up by the root in harvesting. The grain is much heavier than the common Buckwheat, and I think it will be found more valuable for all purposes to which it is applied.

For the New Genesee Farmer.

CHINA TREE-CORN—ONCE MORE.

Messrs. Editors—Much has been said, of late against Thorburn's celebrated China Corn, and if you will permit me, I wish to say a few words in its favor. And, lest any of your readers should infer that I have been bribed to engage in its defence, I would state, that I was merely humbly engaged in the article, to the tune of \$1,50, which I paid for six ears of this reputed *china* corn. That it does not possess the good qualities attributed to it, appears quite evident, and the fact of its being a late variety, must have been known to him who gave it such a high recommendation. It was, in fact, a splendid harrow, and most admirably managed. Still, I fear, that in exposing the fraud, any good qualities which the corn may really possess, will be entirely overlooked. With me it has not proved an entire failure. I planted on the 5th of May, and a considerable quantity of my crop ripened sufficiently for seed. From information received from several gentlemen who have grown it the past season in Ohio, I am inclined to believe it will prove a valuable variety in a more southern latitude. H. Case, Esq., Deputy Post-Master at Buffalo, informed me that he raised about an acre of it the past season, on his farm in Ohio, and considers it a very profitable variety for that section of country. From these facts, I infer that it may be well for our south-western neighbors to give it a trial. Not, however, at two shillings an ear, for the benefit of G—— T——'s "widows and orphans," but "without money and without price." I intend to enclose an ear in every bundle or box of rice which I send south or west next spring; so that my customers, *volens volens*, shall possess some of this noted "China Tree Corn."

I have an early variety of the white flint corn, which very much resembles the China in appearance, only that it is not more than half the size. I intend, next season, to attempt to "cross" these two kinds together. This I hope to do by planting the China early and the white flint several weeks later. I think a "new variety" may be thus obtained, which will prove valuable in this climate.

Yours, &c.,

EXPERIMENTS ON POTATOES.

Messrs. Thomas & Bateham—Ever since I commenced farming, I have been engaged in more or less experiments, sometimes with favorable results, and sometimes otherwise. Last summer I tried an experiment in raising potatoes, the details of which, if you think will interest your readers, are at your service.

The ground upon which they were planted, was a part of a field of nine acres, having been seeded to clover some four or five years ago, now mostly run out. In the first place I drew upon the field 225 cart loads of long yard manure, and also four loads of leached ashes. The plot planted to potatoes, was ploughed with much care, of good depth, and smoothly laid over. Then followed a heavy roller lengthwise of the furrow. The harrowing process was continued until the surface was completely pulverized.—

On the first of June commenced planting, and this was the manner in which it was done:

First, a line was stretched across the field, then followed a man making a trench under the line with a hoe. The potatoes were then dropped in the trench one foot apart, and a gill of air-slacked lime was thrown upon each potatoe. Then followed two men with hoes, drawing the earth from each side, and covering the potatoes 3 or 4 inches deep. The rows were just three feet apart, all straight, and the whole looked as smooth and handsome as an onion bed. The amount of land planted was 126 rods, and the quantity of seed was 30 bushels. The after culture was merely passing between the rows with a cultivator, often enough to keep the ground loose, and free of weeds. During the first two months, the crop looked finely, but the very dry weather in the latter part of summer and fall, checked their growth and spoiled the crop, the whole amount of which was only 150 bushels, being merely at the rate of 220 bushels to the acre.

And now for the conclusion of the whole matter.—The only error I have been able to discover in the whole process, was in planting them too shallow. Had I, with some instrument like a mattock or grub-hoe, cut through the turf, and placed the seed potatoes so that the tubers would have been under the turf, I think the crop would have been as large again. The season was so dry, and the manure covered so deep, and the crevices entirely filled, so that the first crop derived little or no benefit from it. The lime, I think, improved the quality of the potatoe.

For the New Genesee Farmer.

Important Considerations for Farmers in the Genesee Country and the West.

Messrs. Editors—When it was first announced that the Genesee Farmer was to be discontinued, or removed to Albany, I felt that I and my brother farmers had lost a friend; and the Genesee country had lost that which had done the most to promote its greatness and prosperity, and which was well calculated to develop its resources. The Genesee Farmer had its birth and education amongst us. We gave it our name, and regarded it as a part of ourselves which would remain with us during life. We nourished it in infancy, and trained it up to manhood; taught it our habits, our wants, and our resources, and prepared it for a glorious career of extensive usefulness. When lo! at the time of our greatest need—and without our leave or consent—it forsook us for the sake of promised gain; and not only left us destitute, but betrayed our interests by exciting prejudice and suspicion against any successor which might be appointed to take its name and place.

It is true we were promised a substitute from Albany, but that is nearly three hundred miles off, and a very different country from Western New-York.—The paper from there, although of higher price, cannot possibly be as useful to us as one written and published in our midst. The very name of *Albany*, grates harshly on my ear. It always reminds me of stony barrens and political strife, rather than the beautiful and peaceful scenes of agriculture. I can scarcely believe that even an agricultural paper can long breathe the pestilential atmosphere of Albany, without being injuriously affected by it.

I rejoice, however, that our loss is made good—a successor has been appointed, and that, too, not a "spurious" novice, or a stranger, but a real genuine *New Genesee Farmer*, brought up and educated amongst us; one of the same family and school as our former servant, but I trust more strongly attached to home. It is assisted by the same friends, and gives

full assurance of as good talents, and as great usefulness as the old one; and, what is more, will serve us at the same low price, (which is a consideration not to be overlooked *these times*.)

Of the complete success of the New Genesee Farmer, I will not suffer myself to doubt. I cannot believe that the intelligent farmers of the Genesee and Western country, will so mistake or neglect their own interests, as to refuse to patronize, read, and circulate a paper so eminently conducive to their prosperity. Nor yet, that many of them will substitute in its place a paper, which, while it costs them double, is not more than half as useful at least in this section of country.

The mercantile and political interests of this country alone, support three or four daily papers, and as many weekly, at prices from two to eight dollars each per year; and if the cultivators of the soil, who constitute eight-tenths of our population, cannot sustain one paper devoted to their interests, even at the low price of fifty cents per year, it presents a sorry picture indeed, and will not speak well for this farming community. Some farmers will excuse themselves from taking even this paper, by the plea of *hard times*;—but in my estimation, instead of this being a reason for declining, it is the very first reason I would urge *every farmer in the land* should take it; and why *increased and united efforts* should be made for the promotion of agriculture. If, as was formerly the case, our wheat brought us about two dollars per bushel, we should have nothing to fear, there would be no cause for special effort or alarm; we might continue to sow our wheat and our clover, with full confidence of reaping a rich reward, and of soon acquiring competence or wealth. But now our golden prospects are darkened, our wheat only brings, seventy-five cents per bushel, which is not adequate to our expenses, and the interest on our land. We need, therefore, to look around us for new resources, and new objects of cultivation. New departments of agriculture must be studied and engaged in. Consequently, there is more need than ever, of circulating information on these subjects. Not mere book-knowledge, manufactured by Lawyers, Doctors, &c., but plain, practical facts, written by farmers themselves, through their own paper, giving an account of their experiments and practice, and their most successful modes of increasing their profits.

Such are the objects of the New Genesee Farmer, and such will be its influence, if farmers will do their duty, by extending its circulation, and writing for its columns.

Yours, &c.

MONROE.

January 24th, 1840.

An Appeal to the Farmers of Monroe—Proposed Agricultural Society.

BROTHER FARMERS OF MONROE COUNTY—

It is high time for us to awake. Troublesome times have come upon us, and our harvests, although abundant, no longer bring us in our accustomed revenue. Our expenditures are going on continually, but the Banks and the Millers have "stopped our supplies" of cash, and the consequences to us are the most disastrous. The truth is, our wheat for several years past, has brought an extravagant price, and in consequence we have become rather too extravagant in our expenses. Our wheat crop has supplied us with cash, and we have accustomed ourselves to purchase nearly every thing we desired—much of which we might have produced ourselves, or done without. So that our money has been expended as fast as obtained, leaving us but little the richer. At the same time, our exclusive attention to the culture of wheat has prevented the general improvement of agriculture, and left us entirely at the mercy of the fluctuating waves of commerce; prepared to feel the full force of *'hard times'* whenever, as at present, a scar-

city of money, or a glutted market, should stop demand for our only staple, wheat.

Now, every farmer will admit that these things ought not so to be. The owners of this rich country, possessing such resources and such advantages, ought to be much more independent, and less exposed to the effects of 'panic' or 'pressure' in the money market. This can be done by improving our agriculture so as to produce a greater variety, larger quantity and better quality of articles on our farms, and to lessen our need of money, while, at the same time we increase our means for obtaining it. Monroe is one of the richest agricultural counties in the state, possesses advantages superior to almost any other; at the same time it is behind many others in agricultural improvements, particularly with reference to stock. As one evidence of this, I would refer to the disproportion which exists in the Rochester Market, between the prices of different agricultural products. A few days ago, when wheat was selling at six shillings a bushel, I asked the price of a joint of beef, and was told ten cents per pound. We have need, therefore to increase the quantity as well as improve the quality of our stock.

As the first means of improvement, a more general circulation of information among farmers is indispensably necessary. Let every one subscribe for the New Genesee Farmer, (all can afford it,) and let all who feel an interest in the subject, write its columns, giving an account of their success, stimulating others to effort. I would particularly mind those who have choice stock, of the importance of giving information of it through the Farmer. It would show that something has been done on this subject, and would mention that there are in this county several short-horned Durham Bulls, (which are better than any other to mix with our common cattle,) and yet does not seem to be generally known; at least but a few try to avail themselves of the opportunity offered for improving their stock.

Breeding of horses, too, is most shamefully neglected. The majority of farmers do not seem to reflect that it costs no more to raise a good colt than a poor one. Oliver Culver, Esq., of Brighton, owns a colt sired by the celebrated Henry, which cost him \$2,—a most perfect animal; and yet some farmers in the vicinity, patronize the miserable cream horses, instead of availing themselves of the best blood ever introduced into Western New York.

In sheep we are also far behind the age in improvement, as any one at all familiar with our market can admit. In the breed of hogs there has been considerable improvement within the few past years. C. Sawyer, of this city, has some as fine specimens as can be found in any part of the country. Mr. Isaac Moore, of Brighton, has also taken some pains to produce a very fine breed. Many others might be mentioned who have lately done much to improve their farm stock, but I leave them, in hopes that they will soon speak for themselves.

I mention these things to show that there is a disposition on the part of many at the present time to improve the agriculture of this country, and I truly believe that the time has come when vigorous and united efforts are called for on the part of the friends of the cause. I say united, because I believe that no other means would be so effectual as the organization of an efficient *Agricultural Society*. I believe that such a society would now be well sustained, with the most beneficial results. Nearly all other professions and occupations have their societies and associations for mutual benefit and improvement. But the cultivators of the soil, the great mass, and very foundation of the community, have nothing of the kind in this country. No united or systematic efforts have been made in six years past, to promote the great art of agriculture.

be most appropriate and important business of man be basis of our government and civilization. Let us no longer content ourselves in this way; but let us set to work, and overtake the spirit of the age—us associate ourselves together for mutual aid, to learn lessons of improvement from each other, and by imitating emulation, stimulate each other forward; thereby increasing our enjoyments and our possessions.

I have conversed with a number of influential farmers, and they agree with me on this subject. And, in a view of testing the question, and bringing the matter before the community, I would suggest that all those who feel an interest in the subject, send in their names and residence to the editors of the "Farmer," during the month of February, together with their opinion as to the proper time for forming a society; and that if the project is approved, the names may be appended to a call for a county meeting, to take the matter into consideration. X. Y.

Rochester, January 28th, 1840.

REMARKS—We have several times been requested to bring the subject of an Agricultural Society before our readers, and rejoice that X. Y. has introduced it. If a society is formed, it must be sustained by the efforts of practical farmers, and we prefer to let them speak for the subject. We will gladly attend to any suggestion that may be made to us, and pledge our most ready co-operation in any plan which may be adopted for the promotion of the cause in which we are engaged.

Our friend, X. Y., has a beautiful farm near this city, and we can assure our readers he feels a deep interest in the subject on which he writes.

In connection with this subject, we are happy to inform our readers, that Mr. T. Weddle, of E. Bloomfield, who is well known as an importer and raiser of stock, has bought an excellent farm near this city, and intends to remove to it without delay.—Eds. N. Y. Farmer.

For the New Genesee Farmer.

ROHAN POTATOES.

MESSRS. EDITORS—I planted one bushel and a half Rohan Potatoes last spring, and the result was as follows:

The ground had been cropped with Ruta Baga for several years previous, and was prepared by once ploughing and marking out with a plough into rows three feet and a half apart. The seed was cut into pieces one eye each, and two pieces planted in a hill—the hills three and a half feet apart. The ground planted, was about fifty rods, or one-third of an acre. They were planted about the last days of May, and ploughed and hoed twice during summer. Owing to the heavy rains in June, and the peculiar situation of the ground, the water killed about one hundred hills, and the same number more were so nearly destroyed, as to produce but a little. My loss from the wet I should think was between ten or twenty bushels. On digging, I found from eight to fifteen large tubers in each hill, and my crop amounted to one hundred and seven bushels, being over thirty bushels from one, which is a very great saving of seed.

If I had planted them about the first of May, the product would doubtless have been much larger, as they continued to grow till killed by the frosts.

I have tried these potatoes for the table, and find them excellent, being dry, mealy, and of good flavor equal, in my opinion, to any potatoe in common.

Yours, &c.

E. HARMON.

Wheatland, Jan. 1840.

THE CULTIVATOR.

The first number of the seventh volume of this periodical was published at the commencement of the year, and under the editorial supervision of Willis

Gaylord and Luther Tucker; we doubt not it will sustain the high character it acquired under the hand of Judge Buel. It is the same size and price as heretofore, being somewhat larger than the New Genesee Farmer, and at one dollar per annum. It deserves the extensive patronage it receives; and with only two other agricultural papers in the state, one at New York, and the other our own, at Rochester, we do not see why our hundreds of thousands of farmers may not profitably extend their encouragement to all of them. Each county sustains several political papers, and hundreds are issued within the state; but who will deny that an agricultural paper is more important to the farming community? The Cultivator and New Genesee Farmer, both taken together, with the postage, would cost less by nearly a dollar, than the postage and cost of the cheapest political newspaper.

AN EXPLANATION.

"Preparing Manure for Hot-beds."

On reviewing the article on this subject, on page 18, it occurred to us that our remarks were not sufficiently explicit. We meant to be understood, that fresh unfermented stable manure should be lain in a heap to ferment, as much as two weeks before forming a hot-bed. But this preparation is not necessary, if the manure has already fermented. If a hot-bed be formed early in the season, and contain a good body of unfermented manure, such as is usually collected fresh from the stables by gardeners, in the vicinity of cities; it takes several days for it to ferment and become warm; then it almost invariably becomes too hot, and for a number of days throws off a tank gas or steam, so that the young plants are either burnt or poisoned to death, and the bed has to be sown anew; and much time is lost. Whereas, if the manure be prepared before hand, as directed, the first violent fermentation takes place, and the injurious volatile gases escape before the bed is formed; so that it may be sown almost immediately afterwards, with safety and success. We speak from experience.

From the Yankee Farmer.

BARN CELLARS FOR ROOTS.

The communication of "ECONOMIST," in the last number of the Farmer, relative to the cultivation of Roots as a feed for Stock, and the importance for providing a suitable place to store them during the winter, contains some valuable suggestions, to which it would be well for every one who contemplates raising them in considerable quantities, to attend.

Having raised several hundred bushels of Ruta Baga Turneps, and other roots, the past season, and not having been sufficiently careful to provide myself with conveniences for storing them elsewhere, I was compelled, though reluctantly, to take them into my cellar. The weather, at the time of harvesting them, and for several weeks subsequent was uncommonly mild and warm, and the nauseous exhalations from my turneps bin, in consequence were hardly endurable. A large proportion of the roots rotted, and filled the whole house, not even excepting the upper rooms and garret, with their pestilential effluvia while the atmosphere of the cellar, the repository of my edible treasure, was impregnated with an odor scarcely less potent and certainly no less beneficial to the inmates of the rooms above, than the miasma of the most revolting carrion.

In one bin, containing about two hundred bushels, more than one hundred are rotten, and the remaining hundred will doubtless be in the same condition before they can be redeemed from the filthy and putrid mass in which they are imbedded. Of the residue of my crops, which amounted in all to upwards of four hundred and fifty bushels, from something less than three quarters of an acre, I have already fed nearly two hundred to my stock. The rest are as sound and sweet as they were on the day they were harvested, having been frequently spread on the bottom of the cellar, and exposed to currents of air from the doors and windows; a method which, if I had "time and space" sufficient for the operation, would doubtless have saved the rest.

Although I cannot but regret the loss of my turneps, which I regard as the result of carelessness in having harvested them too early and the want of sufficient storage, I have but little ground for complaint

The two hundred and fifty bushels will amply remunerate me for the cost of cultivating the entire crop, and leave, after deducting the expense of raising and harvesting those that have rotted, a handsomer nett profit than any other crop on my farm.

EDITORIAL REMARKS.—The above communication shows two facts very important to our farmers, and we hope that they will profit by them, as they are placed before them in a strong light. As our correspondent found that he was well paid for his labor in raising roots, even with a large loss, it is evident that his crop would have paid a very handsome profit, if saved well. And so great a loss, with the serious disadvantage attending it, urges strongly upon every raiser of roots the importance of having a barn cellar.—Ed. Yankee Farmer.

THE LIFE OF THE HUSBANDMAN.

"I am a true laborer. I can earn that I eat, get what I wear, owe no man hate, envy no man's happiness—glad of other men's good—content with my farm; and the greatest of my pride is to see my ewes graze and my lambs suck."—SHAKESPEARE.

We have come to the conclusion that Nature's truest nobleman is the man who earns his bread by the sweat of his face, upon his own bought and paid for plantation. An independent farmer may stand upon his own house-top and say to himself, as Selkirk did—

"I am monarch of all I survey,
My right there is none to dispute;
From the centre, all round to the sea,
I am lord of the fowl and the brute."

He is truly a rich monarch—with a landed title more secure than that of feudal lord or baron—more easily preserved and protected, not by deeds of valor, and through the shedding of blood, but by the lawful labor of the hands. His house is his castle; his acres his dominions. His gardens are his parks, his grass plots his lawns, and his forests his groves. His cattle, sheep, and poultry are his subjects, and he becomes at pleasure, either the executioner or the multiplier of such subjects. Tell us if the king upon his throne has more power worth possessing. His happiness we know is less, as he increases toil, cares, and his sorrows in proportion as the cultivator of the soil diminishes his.

In the spring time he sows, in the autumn he reaps. Providence has assured him that spring time shall not fail, and he has the assurance of the Giver of every good and perfect gift, that as he sows, so shall he reap. His grounds are watered in the season of drought with the rains and dews of heaven, and in the damp season the sun shines to cheer, invigorate, and give promise to his labors. The severer tasks of the summer are succeeded by the lighter labors of the winter. As we have said, in the words of Will Shakespeare, "he earns that he eats, and gets what he wears." He may say truly, and with an honest pride—

"I eat my own lamb,
My chickens and ham,
I shear my own fleece and I wear it."

What could a man want more? and how can a farmer, capable of enjoying life, possessed of his farm-house, his farm, and his necessary implements of husbandry, ever sigh for a residence within the enclosure of a city—choosing bricks and mortar for the chimney-room of a spacious farm-house, the dust of the town for a village; the three-story brick house for the granary or the haycock; for the purest air of heaven, for the atmosphere of a thousand unwholesome smoky houses, and ten thousand unwholesome breaths? How could a farmer make such a choice as this? We would pause for a reply, did we not know that the only answer which could be devised, after a long study, would be the unsatisfactory one that something better was anticipated only for it would be a miracle, almost, for a man to find himself happier or in better circumstances after a change of residence from the country to the city. No, no. The true elysium; the real paradise on earth, is the country. The city for the task-master and his hard-working servant; but the country for the man who wishes for health and leisure, contentment and a long life.

The ancient Romans venerated the plough, and at the earliest, purest time of the Republic, the greatest praise which could be given to an illustrious character, was a judicious and industrious husbandman.—Portland Adr.

EXECUTION.—Robert Miller was executed on Friday last, at Whitesboro, for the murder of Barney Luddy. Some fifteen hundred persons had collected for the purpose of seeing the execution, but they were disappointed, the sheriff having made such arrangements as are contemplated by law for private executions.

In our last, we gave a particular notice of the "Magazine of Horticulture." The first number of the sixth volume has since come to hand, and we extract two articles from its pages, when we are confident will give our readers a favorable impression of the ability and talent with which the work is conducted.

THE CULTIVATION OF CELERY.

BY J. W. RUSSELL.

As good celery is always sure to meet with a ready sale in the market, and command a liberal price when found there, I propose giving a few practical remarks on the necessary treatment required, from the first sowing of the seed in the spring, to the taking up of the roots, in the autumn, for use. In the first place, be it remembered, that the writer of this does not claim any greater knowledge than that possessed by gardeners and others, who have had experience in the cultivation of celery; but as the article may meet the eye of those persons who have not acquired the requisite knowledge, to grow it to perfection, it is probable they may glean something from it, that may be of some assistance to them.

There are six or eight varieties of celery cultivated, and all those who cultivate it, have their favorites; nevertheless I will venture to recommend the white solid, and the rose colored solid celery, to be grown, either for the market or for family private use. The second week in April, if there is a cucumber frame at work, prepare two or three shallow boxes, and fill them with fine rich soil, and sow the seed on the surface, with a liberal hand; then press it down pretty solid, with a piece of board, and cover it, lightly, with very fine sifted earth; this does not give the whole a gentle watering, and place the boxes in the frame, close to the front.

When the plants make their appearance give them air every day, if possible, by propping up the sash, at the front, where the boxes are placed. As soon as it is perceived that the plants have the least tendency to grow up weak, they must be removed from the frame, immediately to the open air, closing some well sheltered spot. On the approach of bad weather they may be removed to some place under a cover, and taken out again after the unfavorable weather is over. If no frame, as spoken of, be at hand, sow the seed on a rich moist piece of ground, the last week in April, in a sheltered situation; the ground must be well enriched for this purpose, and the older the manure is, the better. Dig it over, and rake the surface very fine and even; then sow the seed pretty thick, on the surface, and with a clean spade beat it lightly down, nice and even, and cover it over, about a quarter of an inch, with fine soil.

As soon as the plants are about two inches high, they should be transplanted into a nursery bed—but previous to this, the ground must be well manured and dug over; then lay a board on the ground, in order to dig up a sod, and set the plants out in regular order, at least three inches apart, plant five or six plants in a row, and set the last process of much trouble; but I can assure all who have such an idea that it is a process indeed sensible necessary, and the utility of it will be presently seen. When the plants are taken up from the seed bed, before proceeding to transplant them, do not forget to rub off all the side shoots, which, if left on, are just taking their appearance around the base of the plants, and cut off the ends of the roots, if it is desired to plant at a distance of two feet.

About the first or second week of July the plants will be ready for the final planting out—Their roots, robust appearance, by this time, I imagine, will give great encouragement to the grower, to go on and do this good work; but, on the contrary, if the plants had not been removed from the seed bed, he has to deal with a considerably larger quantity of weeds, and they are now making a considerable progress, the weeds being too weak to be pulled up, now that they are sandy, they would be flying up in the ground. When this is the case, the remedy is, to cut off the tops, and leave them, for four or five weeks, standing in a dry place, so that any person who has the least pretensions to the cultivation. The plants being now weak, it will be found necessary to shade them from the sun, through the middle of the day, for some time, until nature has made a fresh effort, and the plants start to grow; now sow with those that have been transplanted; for by removing them with a trowel, on a demerit day, they will be free of the chance of being killed by the rain;—for while the others will not grow, and in nursing, they will be making a rapid growth, and however well the former plants are nursed, it is rare that they ever make such good heads as those that receive no check.

If the cultivator has a peat meadow, that is at times overflowed with water, he will find it the best

situation of any for the growth of celery; but as there are but few, comparatively speaking, who have such facilities, the next best location would be where the soil is deep and moist, with the sub-soil clay.—On some gentle slopes, always to prefer deep, moist soil, whatever the sub-soil may be; for it matters not, whether rich the ground may be made with manure; if there is a deficiency of moisture, the growth will be retarded.

In preparing the trenches for the final planting, if the soil is deep, dig it out to the depth of eighteen inches by fifteen inches in width; and the length as far as is thought proper for the number of plants; six inches of the trench must be filled up with the best old rotted manure that can be procured; as long straw litter is not suitable, it should never be used. After the manure has been thrown into the trench, it should be dug over, in order to mix the soil at the bottom of the trench thoroughly with it; this done, cut a little of the soil from each side of the trench, for the purpose of covering it about an inch, and it will then be ready for the plants, which should be set out six or eight inches apart, in a straight line down the trench.

Keep the celery free from weeds, and earth a little, at different times, until the trench is nearly filled up; then earth it up no more, until it is done for the last time, which should be the first or second week of September, or sooner, if necessary. I have two reasons for following this process. The first is, that the roots of the plants are already covered as much as they ought to be, if we suppose the sun and air has any effect on them, or is of any benefit to them. My second reason is, that the celery will make a stronger growth, and will be very much superior, both in size and quality, to that which is earthed up every week or ten days, as is generally done. Good celery ought to be solid, thoroughly blanched and of large size, and perfectly clear of any bluish, such as rust or canker.

Yours, J. W. RUSSELL.

Mount Auburn, Cambridge, Dec., 1839.

From the Magazine of Horticulture

REVIEW OF

The Farmer's Companion, or Essays on the principles and Practice of American Husbandry, with the address delivered before the Agricultural and Horticultural Societies of New Haven county, Conn. By the late Hon. Jesse BUEL. 12 mo. pp. 303. Boston, 1839.

One great obstacle to a more rapid advancement of agriculture, in this country, has been the want of correct and practical information upon the subject. It is true that, within the last few years, numerous agricultural periodicals have sprung up, and among them some of much merit, which have been valuable aids in the diffusion of practical knowledge. The *Cultivator*, of which the much lamented author of the *Essay*, at the head of this article was the originator and conductor, has been, above all, signally instrumental in effecting important changes in American husbandry. The practical knowledge which he possessed he united sound theoretical information, which enabled him to impart useful lessons to the husbandman. No writer, among the many who have contributed to the instruction of the farming community, has seemed to take so broad and comprehensive a view of the importance of agriculture, as a means of enhancing the prosperity of the country, and the condition of society, as Judge Buel. His heart and soul were enlisted in its cause; and he labored hard to disseminate such information as would eradicate the old and exploded method of farming, and to introduce in its place, the more rational and more rational system, which would be so influential in producing the opposite results of the old system. He was aware that it was an arduous task. To combat the prejudices of those who had for years followed the same beaten track, almost determined to listen to nothing which was an innovation upon the established practice, was no vain wish. But he made the attempt, and it is scarcely necessary for us to say, with such remarkable success, as to accomplish the most unexpected results. One of the principal objects for which he labored, was the elevation of the agricultural profession. The idea of a "mechanic's revival" at that time, that ploughing and harrowing, and planting and cultivating, constituted the sole elements to practice farming successfully, has since sunk into a rank and vulgar notion, and the cultivation of a cultivator of the soil one of the most honorable employments from which man has ever derived any thing to seek out other sources of business, which they have imagined would confer more wealth and responsibility.

But the dissemination of better information has weakened the reliance upon the subject. If agriculture has not been elevated to its proper place, it has been caused those who practice it have not made any attempt to improve the art or enlighten their minds—they have not gone into the principles of the science—they have not studied the unerring laws of nature, which exercise a controlling influence upon vegetation. Plough power has alone been deemed the important requisite, and science discarded altogether. But, in language of the author of the above work, we say—

"There is a re-awakening spirit abroad. The lights of science are beaming upon the agricultural world, and dissipating the clouds of superstitious ignorance which have so long shrouded it in darkness. Men are arising which have for some time been actively engaged to improve the condition of the other arts, and elevate the character of those who conduct them—extending their influence to agriculture. A new system of husbandry is coming into vogue which has been productive of great good, and promises many new comforts and blessings to ourselves and children."

We have thus noticed some of the many important changes which have been made in our agriculture during the last eight or ten years, in a degree, we believe through the influence of Judge Buel. We have participated still greater advancement by the aid of our soil; but he has been suddenly taken from us by an all-wise Providence, when his services were coming of the greatest value, and we trust that good purposes which he advanced, and the excellent example which he set, may long exert their beneficial effects upon the agriculture of the country.

The present *Essay* was prepared by Judge Buel a short period before his death, and the last sheet but just be passed from the press, when the country was called upon to mourn his loss. It would be useless for us to occupy space with a simple review of the work, as we could not do it any justice in the limited room we have to spare. Every farmer should read it—should not only own it, but read it—he should study it—it should be his text book, in all matters relating to farming;—and if it is not the means of highly increasing the products of his farm, it will cause the author's plain, practical and familiar to have been a disreputable.

The *Essay* is divided into twenty-seven chapters, most of which treat on rural embellishment; or this is a subject which has received but little attention especially from farmers, we cannot refrain from saying some extracts from this chapter. It concludes thus:—

"There are few things better calculated to adorn our homes,—where the social virtues love to aggregate; and to dispense their blessings, than rural embellishments. This is true, whether we apply them to our neighborhood or individual shade, public grounds about the great cities of the old continent, some of which comprise an area of five hundred acres, are the theme of general admiration, the trees of healthful exercise and recreation, and the seats of high intellectual enjoyment. The lessor and villages, even of our country, owe more of charm and interest to the trees and plants which embellish their squares, street and grounds, in the eye of a man of taste, than to any ostentatious show of wealth and mortar—more to the beauties of nature than the works of man. Nay, the highest efforts of human intellect are in vain put in requisition to tote the handworks of the Creator. And when come down to the suburban residence, and even unpretentious abode of the farmer, how are beauties heightened, and their value enhanced, seen of ornamental trees, and a well-kept garden."

It is a common opinion, that he who plants does not plant for himself, but for posterity; that will not deny their fruit or shade beneath the tree, but that those who follow him will reap the fruit of his labors. Judge Buel has shown the fallacy of such reasoning, by relating his own experience on the subject.

Landon tells us that in travelling from Stralsund to Munich, he passed through a continued avenue of forest and fruit trees planted on both sides of the highway for more than one hundred miles, that has passed through New England, in some that had admired the beautiful trees with which it is a measure enshrouded? The great object of planting is, that one may retire to enjoy the shade of the trees which he plants. Such a reflection is unworthy of the age, which should, does not, have regard to the interests of the family and of posterity.—and is, besides, a

to hold a shorter tenure of life than all of us hope for, and most of us expect. Twenty years ago, at forty years of age, we commenced the cultivation of what was termed a barren, unmeable common, not an acre of which had been cultivated, and on which a tree or shrub had never been planted by the hand of man.— We have now growing in our court-yard, comprising about half an acre, and in the highway in front of it, fifty species of forest and ornamental trees, many of them forty and fifty feet high, more than fifty species of ornamental shrubs, not including the rose, besides a vast number of herbaceous, ornamental, and bulbous and flowering perennial plants—the greatest number of which, in all their variety and hue of foliage, flowers, and fruit, may be embraced in a single view from the piazza. Most of our fruits have been raised by us from the seed, or propagated by grafting or budding. Yet we can enumerate more than two hundred kinds, including varieties, which we are now in the habit of gathering annually from trees, vines, &c., of our own planting. We feel grateful to God for these rich and abundant blessings, and for the impulse which prompted our labor. We have adduced our own example, not in a spirit of vaunting, but to convince the young and middle-aged, that there is abundant reason for them to plant with the hope of enjoying the fruit of their labor. The old should plant from an obligation they owe to society, and for the reward of which they have but a short period allowed them. The young should plant for the double purpose of benefiting themselves and their children.

"We would by no means advise that the farmer should confine himself to mere ornamental trees.— There are many fruit trees that are not only ornamental but useful, about dwellings, as the cherry, pear, apple, quince, &c.

"There is not a spring or an autumn in which a few hours cannot be spared without detriment to the labors of the farm, to plant out fruit and ornamental trees and shrubbery about the dwelling, and but very few hours are requisite. There is no great cost incurred in the business. The holes for the plants should be dug larger and deeper than the size of the roots, in order that they may be surrounded on all sides by a rich surface mould, into which the new roots may push freely, and find food. The minute soil from the pit should be thrown away, and its place supplied by mould taken from the surrounding surface; the roots should have their natural direction, and the earth be well pressed upon them; and the plants should be protected from cattle till they are of a size not to be injured by them."

We commend the work to every individual interested in agriculture; and we trust its dissemination will elevate and improve the standing of agriculture, and conduce to its prosperity throughout the country.

From the Yankee Farmer.

BETTER BUY THAN BORROW.

I like to see a farmer well provided with tools, that he need not be subject to the very troublesome inconvenience of borrowing. Some, however, prefer to carry on their work by means of their neighbor's implements, and, from frequent use of the same, they seem to think, that they derive a positive right to them. You may bring home a new axe, for instance, all ground and sharp for business, and, in half an hour, if you wish for it, you are pretty sure to find it at the woodpile of your borrowing neighbor. Is not this most provoking? A farmer, as well as a mechanic, should have tools of his own. How would it answer for a carpenter to depend upon a brother mechanic for his broad-axe, his mallet, his hammer, and hand-saw? For myself, I have always on hand, and ready for use, every sort of farming utensils, that I think I may need, in my ordinary way, perhaps of husbandry; and it may be, that what has been remarked about it is true, viz: that, for this very reason, my neighbors are but too negligent in this matter, calculating that whenever they want a tool, they know where to find one. I have been called a "good-natured man, and willing to oblige," but, from this time henceforth, I am determined to set up my Ebenezer in the business, and show them, that I am not without grit and resolution. I will not be bothered, as I have been for a series of years, with such continual annoyance. I would be liberally disposed towards my neighbors; I would be in season and out of season in my good offices; but with respect to farming tools, there is no more lack of them for the agriculturist, than there is of lace, rlands, and trinkets for a bull farmer. Every sort and kind of tool is offered for sale at the Agricultural stores, and a man is not obliged now, as once, to botch up an old, worn-out tool, because there are no more to be purchased. The best accommodation on this behalf may now be found on

the right, and on the left, so that borrowing is out of the question. I say to the farmer who expects to carry on his business by depending on his neighbors for tools,—avaunt! nor presume to meddle with my scythe, my rake, my flail, my blade, my axe, my hoe, my plough, my crow, & wedges, and again I say, hands off from my beetle and wedges.

Beetle and wedges! Apropos.—These are the worst of all implements for lending, and, when once from home, the owner is sure to see his beetle returned, (if it even be returned,) cracked, rimples and useless. By the way, I have said above, that every sort and kind of farming tool is offered for sale at the agricultural stores; but it is not so altogether. Not long since I made inquiry at the several establishments in the city for a beetle, when, behold, I was told that no such thing was there, or ever was. "Call at the wooden-ware shops," said they, "and you will be accommodated." I inquired that a beetle was a farmer's utensil, and why not keep them? "No," was the answer, "a beetle belongs to the line of brooms, baskets, rags, and bread-trays." "Who?" said I, and, trudging away to one of the wash-butchers, made inquiry for the article. They, indeed, showed me something, called a beetle; but, "O tempora, O mores!"—a miserable, flimsy affair! What a wretched falling off, in the beetle line, from those noble thumpers in the days of our grandfathers! Abraham Aulditch stood hind by and remarked, "what a coil of such tools now-a-days, when we old-timers have grown out of fashion, and coal is all the go!" But I soon satisfied Abraham, that he knew not both the purposes of beetle and wedges upon a farm. "Farmers do without them?" "This is absurdity." I may be thought more nice than wise, when I say, "give me a finished beetle for my use. I want none of your ill-shaped smashers, as long as a horse's head. I would have a smooth and stout handle also, a little biggest at the upper end, that it need not slip out of my hands, when I give the blow. The rings, to be true, need not be polished, but they should be of proper width, circumference, and thickness, and of tough iron. I want no champing in the banking of my farming tools." I turned to leave the place, when Abraham again accosted me, saying, "I tell you what, neighbor, come to think on't, you should purchase a good beetle. Un my want to borrow it in peering some young's-sall for a little lot I have in your vicinity." "Borrow! you borrow, Abraham?" said I, and hastily departed, leaving him to ponder on where and how he might supply himself with beetle and wedges.

Again, another word or two on the subject of borrowing. You may say, Mr. Reader, that farmers ought to be obliging to each other, and, that without borrowing and lending, more or less, it will be difficult for a neighborhood to prosecute their business of agriculture, as, sometimes, it happens, that accidents occur—tools may be suddenly broken and destroyed, without a chance of immediate reparation, &c. Granted. It is the duty of all to lend their aid in such cases, and when I refuse to assist my neighbor in such an emergency, then mark me for a disobliging, cross-grained fellow. But, sir, it is the negligent, habitual borrower, the one who can not find a fig for your tool, after he has done with it, and who never will own one, so long as he can borrow, against whom I lay my charge. Neither do they confine it to tool-borrowing altogether; I can hardly get my newspaper into my hands from the Post Office, before I am accosted by some little archin with—"daddy wants the paper," as much as to say, that we take it in partnership!—But, in particular, with borrowing farmers I have no patience. No one can work without tools, and if a man owns land, and pretends to farm it, let him simply hand-off, to prevent hard words and wry looks. I set my face against these habitual borrowers of farming tools. Let them not think of being accommodated from my tool-house. Tough not,—meddle not with mine, from my garden dibble to my beetle and wedges. S. H. HOG.

Decomposition or Putrefaction of Vegetables.

All vegetables, when the principle of life has departed from them, begin spontaneously to be decomposed (to putrefy). The elements which enter into the composition of plants, when left entirely to the disposal of the ethereal affinities, have a tendency to separate from each other and form new compounds very different from those which compose the living plant. This is termed the "spontaneous decomposition" of vegetables. The substances formed by the new arrangement of the elements of the vegetables, as if it had been totally annihilated when life ceased to preserve its particles together in the vegetable form. The compounds formed, when the vegetable dies and putrefaction proceeds, are, carbonic acid, water,

carbonic oxide, and carburetted hydrogen. The two former are the chief results of the decomposition; the two latter formed more sparingly, and principally when there is not a free supply of oxygen to the substance undergoing decomposition. The carbon and hydrogen of the plant have a constant tendency to unite with oxygen, and form carbonic acid and water. Now there is never present in the vegetable a sufficient supply of oxygen to produce these compounds produced from external sources, so formed, one of which (carbonic oxide) requires a large quantity of carbon and hydrogen.

In vegetables which decay under water, and treated by hydrogen is abundantly formed; hence it is the gas which is found so plentiful in summer in stagnant waters containing quantities of putrefying vegetables.

The spontaneous decomposition of vegetables goes on most rapidly when they are exposed to the air, kept moist, and preserved at a degree of warmth higher than the usual temperature of the atmosphere. Putrefaction is retarded or almost prevented if the vegetable be dried, so that its own moisture is expelled, carefully excluded from air and moisture, and kept cold. The influence of heat in promoting the decay of vegetables depends upon the repulsive power it possesses, by which it disposes the various elements to assume the gaseous form. Animals and vegetables are frequently found in a snow or ice, in a high state of preservation.

Such are the changes which go on in the dead plant. That mysterious agent, Life, is able by its peculiar power, to control and overcome the chemical attractions which tend to produce the changes and retain the elements in that state of combination best adapted for the performance of their proper functions: at the moment however, in which life ceases to superintend the exercise of these functions, they cease, and the chemical attractions, no longer restrained by the vital principle, obtain full sway. The carbon, oxygen, and hydrogen, formerly existing in the state of wood, bark, leaves, fruit, or seeds, obey the laws of chemistry, return to the state of carbonic acid, water, or flammable gas, mix with earth and atmosphere, afford nutriment to the new plants, again form leaves, flowers, and all the beautiful and diversified organs of the vegetable creation—again wither and decay, and return to the soil to supply new generation, and continue the same scenes of unceasing revolution.—*Chemistry of Nature.*

Notwithstanding the immense grain crops of this country, the past season, and the fact, that large quantities of flour have been exported to Europe, that great vessel, have arrived at New York from the city of Trieste, from Odessa. This may seem like a contradiction to New Castle, to those who recollect the fact, with the fact that this rice is intended for the market.—*Boston Times.*

GREAT WHEAT MARKET IN OHIO.—A report from the Zanesville Ohio Republic, contains the following: "There have been two millions one hundred fifty thousand bushels of grain sold this year in that country." There is nothing to some purpose.

Let the best ears of corn be selected annually, and there will be an annual improvement; in this way, some kinds that were only raddling some years ago, may now become excellent.

Two farmers may have the same kind of corn, and one selects with care his seed, while the other is negligent; after some years there is so wide a difference that the negligent man is astonished at the superior crop of him who he accused with sagacity, and pays a high price for the improved variety.

It is confirmed by positive proof that others have been going forward while he has been stationary, or as Paddy says, "advancing backwards," and at last he awakes from his lethargy and endeavors to progress in rapid strides, by adopting the improvements that others have steadily and profitably pursued.—*Yankee Farmer*

SINGULAR TIMING.—King John gave several lands at Koppington and Atleton, in Kent, to Solomon Aulditch, to be held by the singular service; That, as often as the King should be pleased to cross the sea, the said Solomon, or his heirs should be obliged to accompany him, to hold his majesty's head, if it should be convenient for it, that is, if he should be executed; and it appears, by the record in the Tower, that this same office of head holding was actually performed in the reign of Edward the First.

More than sixty thousand persons are registered on the books of the twelve municipalities of Paris, as in a state of starvation.

THE GOOD WORK ADVANCING.

Nothing can have a greater tendency to encourage the friends of an enlightened and judicious system of agriculture to persevere in their praiseworthy efforts, than the spirit of improvement which appears to be widely diffusing itself throughout our land.

During the present year, a large number of Agricultural Societies have been organized, possessing within themselves the elements of great good. Besides, several societies formed long since, and which were permitted to languish through the lukewarmness of their members, have been re-suscitated.

The raising of roots for the purpose of feeding cattle is no longer a matter of experiment. The great importance of this crop is now established, and we presume that those persons who have put in their winter grain, where the sugar beet has been last raised, and especially if two successive crops have been taken from the same ground, provided the earth has been properly turned up, and the grain sown of a good quality, will be abundantly satisfied with the results of the ensuing season.

The raising of roots for the purpose of feeding cattle is no longer a matter of experiment. The great importance of this crop is now established, and we presume that those persons who have put in their winter grain, where the sugar beet has been last raised, and especially if two successive crops have been taken from the same ground, provided the earth has been properly turned up, and the grain sown of a good quality, will be abundantly satisfied with the results of the ensuing season.

The more general introduction among our farmers of improved implements in agriculture, has not been without its effect. Many of these machines are calculated not only to lessen the labors of the field, but also perform the work in a more perfect manner than it can be done by hand.

The stigma so long attached to this, the most noble of all earthly pursuits, is washed away—the strong prejudices have been dissipated, and agriculture is now regarded by the truly intelligent, as not only the first of arts, but the most dignified calling that can claim the attention of men.—Farmers' Cabinet.

NO ADVERTISEMENTS will be inserted in this paper, except such as relate to matters connected with Agriculture and Horticulture; and these will not be allowed more than 2 or 3 insertions.

BUFFALO NURSERY.

LARGE ADDITIONS are constantly being made to this establishment, and it now embraces a large collection of choice varieties of the Apple, Pear, Plum, Peach, Cherry, Apricot, Quince, Almond, Grape, Currant, Gooseberry, Raspberry, Strawberry, &c.

The location of this Nursery is well adapted to supply West and orders; as the numerous Steam Boats on the lakes enable the proprietor to ship all packages direct to port without delay.

B. HODGE.

Buffalo, Feb. 1st., 1-10.

NURSERY AT POULTNEYVILLE.

THE SUBSCRIBER has several thousand thrifty young Mountain Ash and Yellow Locust Trees for sale, low, in large or small quantities. Also, an assortment of Peach and Apple Trees, Ornamental Shrubs, Bulbous Roots, &c.

S. LEDYARD.

Poultneyville, Wayne co., N. Y. Feb. 1-10.

Gilson's Straw Cutters and Root Slicers.

FOR CUTS AND DES. R. FIG. 9, SEE PAGE 25, N. G. FARMER.

THESE MACHINES are now manufactured by the Subscriber at his machine shop, near the east end of the Aqueduct, Rochester, where a supply will be kept for sale, and also at the Rochester Seed Store.

The price of the Straw Cutter is \$20 and of the Root Slicer, \$11.

Rochester, Feb. 15-10.

PURE CLOVER SEED WANTED.

ANY PERSON having a load or more of warranted pure Clover Seed, may do well to call at the Rochester Seed Store, or write to the subscriber.

Rochester, Feb 1st. 1-10.

SEED STORE CATALOGUE.

THE New Catalogue of the Rochester Seed Store, will be published in time to send out with the next number of the New Genesee Farmer. Descriptions of some new and valuable articles from Europe, will be given in the next number of the Farmer.

MORUS MULTICAULIS FOR SALE.

THE Subscriber offers to those who would engage in the silk business, in Western New York, good sized and healthy trees, of last season's growth, and measuring from three to five feet in height, and untrunked, on as reasonable terms as any other person.

E. F. MARSHALL, Corner of Buffalo & Exchange-sts. Rochester, 1 mo 1, 1-10.

GENUINE ROMAN POTATOES.

THESE celebrated potatoes are for sale at the Rochester Seed Store, at the following low prices:—\$2 per bushel—\$5 per barrel, (2 1/2 bushels.)

As the price will undoubtedly advance in the spring, those who wish to obtain them will do well to order them soon.—They will be safely kept till spring, if desired, and sent according to order.

January, 1. 1-10.

ROCHESTER SEED STORE, 1810.

THE liberal support which this establishment has received for several years past, affords flattering evidence that the proprietor possesses the confidence of the public, and that his efforts to accommodate the community are not unappreciated. While he expresses his acknowledgments for the past, he is happy to inform his friends, that he is now better than ever prepared to serve them; and is confident that future transactions, in his line, will be attended with increased pleasure to himself and satisfaction to his customers.

The present stock of imported seeds is very extensive; they were selected with great care among the best growers of England and Scotland. Among them are many improved varieties, which will be great acquisitions to our gardens and fields. Some account of them will be published hereafter.

With his present advantages, and experience in the business, the proprietor flatters himself that he will be able to guard against every source of complaint, and furnish an abundant supply of superior seeds at very reasonable prices. Any person who had seeds from him which proved bad, last year, are requested to mention the circumstances to him, that reparation may be made.

New Catalogues will be published soon, and sent (and applications, gratis.)

Rochester, January 1, 1-10.

TO NURSERYMEN AND OTHERS.

THE following seeds were procured in Europe, especially for Nurserymen. The supply is not large, and those who wish any of them should order soon:

- European Silver Fir, Norway Spruce, Larch, English and Scotch Larch, Broom, Furze, Pyracantha Berries, Cypress, Horse Chestnuts. Also, for sale, 20 Bushels of fine Peach Stones. A correspondent wishes to dispose of a few hundred young thrifty Mountain Ash Trees.

M. B. BATEHAM. January 1, 1810

AGENTS

FOR THE ROCHESTER SEED STORE AND NEW GENESEE FARMER.

THE following persons will, in a few weeks, receive full assortments of seeds from the Rochester Seed Store.—They will also receive subscriptions for the Farmer.

- Buffalo, W. & G. Bryant. Lockport, S. H. Marks & Co. Albany, Rathlun & Clark. Brockport, George Allen. Scotsville, Andrus & Garbutt. Le Roy, Tompkins & Morgan. Batavia, J. V. D. Verplanck. Avon, R. & N. Wells. Perry, S. B. Parsons & Son. Mount Morris, R. Sleeper. Geneva, J. F. & G. W. Wyman. Canandaigua, J. B. Hayes. Tonawanda, J. N. Bogert. Waterloo, Abram Duell. Auburn, T. M. Hunt. Putney, Hoyt & May. Newark, Hoane & Co. Syracuse, J. B. Fitch & Co. Utica, J. E. Warner. Oswego, M. B. Edson.

In answer to the numerous applications which are made for seeds to sell on commission, I would here state, that I do not furnish seeds in that way except to regular agencies; and I do not wish to increase the number of them at present, especially at far distant places, or small villages.

M. B. BATEHAM. Rochester Seed Store, Jan. 1, 1810.

ROCHESTER PRICES CURRENT.

THE NEW GENESEE FARMER, FEB. 1, 1810.

Table with 2 columns: Commodity and Price. Includes WHEAT, CORN, OATS, BARLEY, PEAS, BEANS, POTATOES, APPLES, CIDER, FLOUR, SALT, PORK, BEEF, MUTTON, POULTRY, EGGS, BUTTER, CHEESE, LARD, TALLOW, HIDES, SHEEP SKINS, WOOL, PEARL ASHES, POT, HAY, GRASS SEED, CLOVER, FLAX, PLASTER.

Explanation.—Of such articles as are bought of farmers, at wholesale, and sold again at retail, the first mentioned is the average wholesale price, and the last the retail. Thus, clover seed is bought at \$6, and sold again at \$7.

Remarks.—It will be seen, on comparison, that our report of the Market this month, is rather an improvement on that of the last. Although but very little is done as yet, the prices of wheat and some other articles, have somewhat advanced. The scarcity of money is, perhaps, as great as ever; but there is less of panic. Men begin to see that some business can and must be done; people still live, and must eat; consequently the produce of the farmer must find a market. The supplies of flour in the eastern cities, are fast being consumed or sent away, and as the season advances, the usual demand for supplies from this section, will return, and revive the desponding energies of our millers and merchants. It will be some time however before much relief can be expected. The banks will not, and cannot, discount largely until the nearer approach of Spring, when our millers and flour dealers can offer them shorter paper. We must, therefore, endure hard times for the present, as patiently as we can, encouraged by the hope that better times are at hand.

THE NEW GENEESEE FARMER

AND GARDENER'S JOURNAL.

To Post Masters and Agents.

Caution.—Some of our friends send letters and papers intended for us, addressed to "the Genesee Farmer;" very naturally supposing that as there is no other paper published here of such a name, that we shall of course receive them.— Now we wish to inform them that no communications addressed in that way are received by us. The publisher of the late Genesee Farmer still keeps an agent here, who claims all such articles and takes them from the Post office. This perhaps will explain the reason why several letters have not reached us, of which we have had complaints. We hope all who have erred in that respect, will immediately inform us of the circumstances, and be careful hereafter to address papers to the "New Genesee Farmer," and letters to

BATEHAM & MARSHALL.

Uncurrent Money.—All western and southern money is at a discount of from ten to twenty per cent. with us; and the low price of our paper will not afford so great a sacrifice.— We hope, therefore, our friends will endeavor to send bills of this, or the centre states. If they cannot get it without, we are willing they should give a premium of five or six per cent for it, at our expense. When it is necessary to send western or southern money, the bills of city banks are preferred.

Valuable Assistance.

The readers of the New Genesee Farmer will be gratified to observe the signatures of some highly respectable writers in this month's paper. Among them we are happy to say, is DAVID THOMAS, of Cayuga county, whose writings on Agriculture and Horticulture have long been familiar to many of our readers, and have done much for the improvement of this section of country. Both he and his son, (our J. J. T.), have been frequent correspondents, and the assistant editors of the old Genesee Farmer; and their united efforts cannot fail to give the new a high reputation for talent and usefulness. M. & B.

To Correspondents.

We again acknowledge our obligations to the friends of the cause, for the kind assistance they have rendered; and we intend to merit a continuance of their favor. We also hope that others, from whom we have not heard, will lend us their aid; so that the high reputation which the Genesee country has obtained abroad, may still be fully sustained by the undiminished talent and usefulness of its agricultural journal.

A number of communications intended for this No. were not received in time, and will appear in our next. Correspondents will oblige us by sending their communications as early as the middle of the month, if convenient; although brief articles may be sent as late as the 25th. The Postage on communications need not be paid by the writers.

We will gladly recompense our correspondents by sending papers to each of their friends as they desire should have it.

One correspondent asks, "what kind of communications are most acceptable" to us? We answer, such as are best calculated to benefit our readers. They are mostly farmers and their families; and whatever will be interesting and useful to them, on subjects connected with their profession, will be acceptable to us.

OUR ENCOURAGEMENT.

We are almost daily receiving from the friends of agriculture, the most flattering expressions of approval and satisfaction, respecting the appearance and character of our paper. All agree in declaring "that the New Genesee Farmer is worthy of its name, and creditable to its conductors;" and express the fullest confidence "that it will exhibit as much talent, and prove as useful as its predecessor." The approval of such friends is highly gratifying to our feelings, and stimulates us to greater efforts. The talent and reputation of the paper will depend on the character of those who contribute for its pages; and we are happy to say that the contributions which we have received more than equals our most sanguine expectations. But there is another kind of assistance indispensably necessary, for the usefulness of the paper to be fully established, it must have an extensive circulation; so that its beneficial influence may be felt and seen, in the agricultural community. And here we conceive is a duty imposed upon each and all of our readers, who profess to be friends of the cause, and wish the good of their neighbors and their country, especially is it the duty of those who wish to see the New Genesee Farmer succeed, and the reputation of the Genesee country sustained. The pecuniary embarrassments of the present time operate severely against such an undertaking as this, and calls for more decided efforts on the part of its friends. Then there are thousands of farmers in the land who would willingly subscribe, and even of those who were readers of the old Genesee Farmer, who are not yet aware that a new one is established; or if they are, they have not seen it, and imagine it to be some "spurious" catch-penny concern, against which they have been strongly cautioned. Such men can be found all through the country, but we know not who, or where they are, and have no means of reaching them, except through the kind agency of others. We respectfully ask therefore that all who wish success to the cause, will give a little attention, and time if need be, to this subject, show the paper to their neighbors and acquaintances, and extend the means of our usefulness; and we pledge ourselves that nothing shall be wanting on our part to make the New Genesee Farmer, full as talented and interesting as the old.

"Number One."—Some of our friends seem to have inferred from a note in our last, that No. 1, of this paper could be no longer had. We did not intend to be so understood however, and therefore state that all new subscribers will be supplied with it. At the same time we hope all agents and postmasters will let none of that number be lost; but be careful to inform us if the subscribers have got it, and save all the duplicates.

Correction.—In the last number of the Farmer, page 28, 3d column, middle paragraph, Oliver Cutler's "Cult" should read Horse—he is six years old.

Exercises on Plum Trees.

Many years ago, perhaps thirty, we heard of an insect in the southern part of Pennsylvania, that was destroying the Morello cherry trees, and not unfrequently the plum trees,—by loading their branches with dark excrescences. Since that time, we have not failed to mark its progress as opportunities occurred; and from repeated observations, we arrived at the conclusion that this insect is indigenous to the mountainous regions of that state. There it appears to confine itself to the wild cherry which so much resembles the peach in its leaf; but on descending into the lower country, it finds other sorts of trees to suit its purposes; and the careless cultivator lets it work on without interruption.

The progress of this insect has been north-westerly through this country, and its advancements rather slow. It has been several years in this vicinity (perhaps 8 or 10,) and yet last summer was the first time that we observed it among our trees. During the present winter however, we have seen its work in Seneca and Ontario counties; and from the appearance of the trees, we concluded it was a stranger in those parts.— What a pity then that so destructive a creature should not be exterminated, when the work could be so easily done!

We have not seen this insect except in its larva state. On cutting into the excrescences several years ago (we believe it was summer) we found worms; but at this season, though we have examined a considerable number of protuberances, we discover nothing but empty cells. It is therefore not improbable that this moth (if it be one) has gone, deposited its eggs, and perished; and we make this suggestion for the purpose of calling the attention of others to the subject. Let the trees be carefully watched the ensuing summer, and let the excrescences be cut off and immediately burned, before the insect escapes.

In the mean time, the trees should be cleared of these unsightly appendages, even if there are no insects in them; and then we shall not be so likely to overlook those which may be formed next summer.

A neighbor lately told me he had cleared his trees in this manner, but was greatly discouraged the next season on finding them as much infested as before.— Now his disappointment may have been owing to not burning branches, and thus allowing the insect to escape; or it may have previously escaped, and deposited its eggs in branches from which no excrescences at that time had arisen. If we watch them carefully however, for a year or two, such mysteries may be easily explained.

In Pennsylvania, the Morello has suffered more than any other tree; but in this quarter we have only seen them on the plum trees. In truth, the Morello is a rare tree amongst us. D. T.

Cayuga Co. 2 mo. 15, 1840.

Note.—This insect, (or as some term it, *knotty blight*) has been spreading among the plum trees in the vicinity of Rochester, for two or three years past, and has nearly or quite destroyed many fine trees; still but little notice is apparently taken of it, and nothing is done to arrest its ravages, or remedy the evil. We hope all those whose trees are effected, will at once adopt the suggestion of D. T. and cut off and burn all the branches which appear to be at all infested; and repeat the operation during the summer, as often as any marks of the enemy appear.

SCRAPS--CULTURE OF FRUIT, &C.

In the catalogue of the London Horticultural Society of 1830, are enumerated, as growing in its garden, *three thousand four hundred varieties* of hardy edible fruits, and fifty-eight varieties of nuts, exclusive of eighty-nine varieties of the fig, one hundred and eighty-two of the grape, fifty six of the pine-apple, and one hundred and thirty-one of the melon.

A correspondent of the N. Y. Farmer in 1831, says, "One of my friends has had plentiful crops of plums for *eighteen years in succession*, by keeping hogs in his fruit garden, yet trees within fifteen rods of that garden, have annually lost all their fruit by the Curculio."

A writer in the Port Carbon Gazette, some years ago, speaking of the importance of cultivating table grapes, observes, "It will be perceived that I admit of no excuse for not possessing a vine; those who have no room for a single garden bed, may have their clean brick walk under the shade of one of luxurious growth—the expense is trifling, compared with its permanent advantages. I have known a single vine, cultivated in this way, to produce in one single season, fruit which sold for more than one hundred and fifty dollars—and a neighbor of mine, who keeps a shoe store, could show on a vine, seven years old, nearly seven hundred bunches of sweet water grapes, well ripened—yet he had no room for a single garden bed, and trained his vine over a brick pavement. Some of his leisure hours were thus innocently and delightfully occupied, without any interference with his business."

The following fact in relation to a fine foreign pear, and which appears to be the case with some other varieties, should not only be well known to nurserymen, but to purchasers and cultivators. "One of our best new European Pears, the 'Duchess of Angouleme,' when grown as a dwarf [upon quince stock] produces a fine large fruit, but small and greatly inferior when grown upon a standard [or pear stock.]"—*Manning's Book of Fruits.*

Good Crops.

The following statement is from a report of the Cuyahoga County Agricultural Society, which held its meeting last autumn at Cleveland, Ohio. The account of the crops of corn, shows most clearly, that the *cheapest* way to farm is to raise large crops, and obtain as much as practicable from a given quantity of land. Who can furnish a single instance of as great a clear profit from a crop of twenty or thirty bushels to the acre, however cheaply it may have been raised?

"The following is the account of the field of corn raised by Mr. Sherman, of Mayfield, and which received the first premium. Two acres were offered.—The land was a black ash swale, without manure, planted four feet each way, labor performed as follows:—"

Ploughing two acres 2 days with team,	\$4.00
Planting, 2 days,	1.50
Hoeing first time, 4 days,	3.00
do second time, 3 days,	2.25
do third time, 3 days,	2.25
Harvesting, 4 days,	3.00
Cutting & shocking, 2 days,	1.50
	\$17.50

C.R.

By 182 bush. 22 qts. corn, at 50 cents,	\$91.00
" Corn fodder,	8.00
" 16 loads of pumpkins,	8.00

\$107.00
17.50

Nett Profit, \$89.50

Of other crops that received premiums, was one of potatoes, 432 bushels per acre; of carrots, one at the rate of 253 bushels per acre; ruta baga, 972 bush-

els per acre; sugar beet, 925 bushels per acre; wheat, two crops of two acres each, at 52 and 56 bushels per acre.

Sugar Beets for Cows.

In a late number of the American Farmer, is a letter from Homer Eachus, dated "Edgmont, Nov. 28, 1832," from which the following is an extract. The writer does not state the extent of his crop of beets, but gives *forty tons* to the acre, as the rate of product of a part of his crop. The whole product was 900 bushels.

"The tops of my beets lasted my cows about three weeks, feeding them well once a day. The first week of our feeding them increased the quantity of butter nine pounds, and continued the same quantity for the two succeeding weeks, which, at the decline of the season, is a great consideration, when we take into account that a stock of 25 cows, decline in the fall of the year from 8 to 10 pounds a week.

"Before they had the tops of the beets, they were down to 55 pounds, at the last churning; the week following, when they had the tops they were up to 61 pounds, and the butter was of a superior quality, both for color and flavor. The week after they got no tops, their produce was 51 pounds; and the week following it was 41 pounds; and this week it is 28 pounds."

Bad Water in our Wells.

We recently met with a case where the water in a newly dug well was excellent, until a few days after stoning it, when it became offensive in odor, and unfit for use, and continued to become worse, until no domestic animal, however thirsty, would touch it. It was suggested that this was caused by the water dissolving certain impurities in the stone, and that therefore cleaning the well after these had become dissolved would remove the evil. Accordingly, in a few weeks, the water was all drawn from the well; the next which ran in was consequently much better; a further improvement followed the second cleaning; and after the third the water was quite sweet and good.

In some regions of country, as in the neighborhood of fetid limestone, it is necessary to select the stone used in walling the well, choosing those which contain no soluble parts, as, for instance, granite and sandstone. It is probable that stones containing iron pyrites, by decomposing the water and causing the evolution of sulphuretted hydrogen, may add very much to the offensive qualities of water.

A knowledge of the experiment related above, may render the water of many wells good, which are now considered of no value and are abandoned.

The Culture of Mangel Wurtzel and Sugar Beet, for Stock.

BY WM. GARRETT, OF WHEATLAND.

*(Continued from page 20.)***After Culture—Hoeing, Thinning, Transplanting, &c.**

The seed does not vegetate very quickly, and if the weather is cold, it will be several weeks after sowing, before the plants are all fairly visible. In most cases, two or three plants will come up from one seed or capsule; and as soon as they are all plainly visible, I go over them and pull out the extra plants, leaving only one in a place, about two inches apart. If this is not done early, and they are allowed to grow together until they are of any considerable size, they retard each other's growth, and cannot be separated without injury. If young weeds have sprung up, they should be destroyed by a light hoeing at the time of the first thinning. In about two weeks, or as soon as the plants begin to acquire some strength, and weeds begin to appear, I go over them again with the hoe, and at this time pull out about half of the plants, leaving them four inches apart. I also go through between the rows with a horse and shovel-plough, (a common small plough or a narrow cultivator will answer,) in order to stir the earth and keep it loose, as well as to assist in hoeing and killing weeds.

If any vacancies occur in the rows, they may be filled by transplanting; observing to take the plants up without injuring the roots, and set them straight and firmly in the ground. I have sometimes transplanted large numbers, but they seldom do as well as those which grow where sown. The young plants are not very liable to be destroyed by insects. Mine are never injured by the fly or any insect, except the black grub, or cut worm, which sometimes thins them out for me not quite to my liking, and I have to fill up the vacancies by transplanting.

As soon as the plants acquire sufficient size, we begin to use them as greens for the table, thinning them out of the rows as desired. They are much esteemed for this purpose by my family and hired men, and during harvest we use large quantities of them with great advantage and satisfaction. The roots are very good for the table when young, but they become rather coarse as they grow old.

Reserving a sufficient quantity for table use, the remainder of the plants should be thinned out at the third time hoeing, to the distance of ten or twelve inches apart. Care should be taken to keep the ground free from weeds; and if the soil is heavy and inclined to become hard, it should be frequently stirred by going through with a horse and plough, or cultivator. This is particularly necessary after rains, before the ground becomes dry. I consider frequent hoeing and stirring the soil, with liberal manuring, the great requisites of successful beet culture. Some persons may suppose, from reading these directions, that the culture of this crop is laborious and difficult; but such is not the case; at any rate I do not know of any crop which better repays for the labor bestowed on it than this. The quantity and value of the produce is so great, in comparison with the amount of land and labor required, that he who neglects, or only half cultivates this crop, in my opinion, practices very poor economy.

Harvesting and Preserving the Crop.

Slight early frosts do not injure this crop, the harvesting may therefore be deferred until severe frosts are expected, which is usually about the middle or latter part of October. Some persons have recommended stripping off the leaves and feeding them to cows, &c. before the time of harvesting. But I consider this practice decidedly injurious, as it not only stops the growth of the roots, but exposes them to injury from frost. If any are wanted for feeding before they have done growing, the best way is to pull them out where they stand too thick; or, if their growth is completed, they may be pulled up clean where most convenient.

My manner of harvesting is as follows:—I pull up four or five rows and throw them together in one row; then go between with a wagon and load them on to it, and draw them to the barn, where the tops are cut off, and the roots put into the cellar under the barn. I consider the tops of great value for feeding cows and other cattle; and if thrown into a shed or barn they will keep good for feeding several weeks. Those who have no proper cellars, may preserve the roots in pits in the field. They are not as liable to injure by heating as turnips or carrots, and if too large a quantity are not put in one heap, they will be in no danger from this source. The best way to bury all such roots, is to make the pit long and narrow, and pile the roots up pretty high. Beets are not so easily injured by freezing as potatoes, and need not be covered more than about half as deeply with earth. The end of the pit may be closed with a few bundles of straw, so as to have easy access to the roots when desired.

Amount of Produce, Feeding, &c.

Not having taken particular pains to weigh or measure my crops, I cannot say exactly what the amount of produce is per acre. But judging from the number and weight of the loads, and the space which the roots

occupy, I should think that I obtained upon an average, about twenty-five tons from an acre. I this year raised three acres, and harvested one hundred and two large loads of about a ton weight; one fifth of which we calculated for tops.

I feed the roots to all kinds of farm stock, except horses. For milk cows, fattening cattle, hogs and sheep, I find them of great advantage. Some animals will not eat them freely at first, but they soon learn to eat them readily. I let them first get well hungry, then cut a few roots and sprinkle on them a little bran and salt. My horses alone do not seem to fancy them. They prefer carrots instead, and if worked hard, want a few oats in the bargain. I feed my milk cows half a bushel of mangel wurtzel each per day, with hay. They keep in good condition, and give milk freely all the winter. Fattening cattle require a bushel or over per day. They thrive and fatten finely on them.—For working oxen I think they are superior to any other food, especially when worked hard in the spring, and during hot weather in summer; as they will do more work, and bear heat better than with any other food. (The roots can be kept through the summer if desired.) I keep my store hogs on them almost exclusively during the winter, and they thrive admirably. With the addition of a little corn, hogs fed on these roots will fatten rapidly and make good pork. Sheep also do extremely well on them; and they are superior to all other food for feeding ewes at lambing time in the spring. I keep 130 ewes, and find them greatly benefited by this practice. For sheep and hogs it is not necessary to cut the roots, but for cattle I cut them to pieces with an axe or spade. A proper machine for the purpose would be some advantage.

I use very little hay, as my sheep and young cattle are fed only straw with the roots. They eat the straw readily without cutting, and keep in good condition.—Thus by raising only two or three acres of these roots, I can devote nearly my whole farm to grain, and at the same time keep a large amount of stock, with good profit.

Whiteland, Monroe co., N. Y.

For the New Genesee Farmer.

FARM STOCK--NO. 2.

MESSRS. EDITORS.—Not having exhausted the subject, I again take my pen. It is a subject fraught with many pleasant reflections, and one that ought to require the attention of every farmer in the country, but has been very much neglected in Western New York. Those who have the management of farm stock, ought to have their minds continually upon them, in the winter season, and see that they are well provided with good shelters. Some suppose that milk cows will do better without being stabled: but they are, in my opinion, in a great error, because it is very evident that milk cows require more than usual care, if we expect to reap much benefit from them. We cannot expect a cow will give a very great quantity of milk, without we mess her with turnips or sugar beets, at least twice a day, until grass comes; and a plenty of good hay. If it were convenient for a farmer, it would be far better to stable all of his domestic animals (save the sheep) in the winter, as he would save a great deal of fodder, and have all of his cattle in a thriving condition in the spring. But the fact is, many think it too much trouble to go to the expense of building stables, for the protection of their animals; and, therefore, had rather see their cattle exposed, at the north-west corner of their barns, almost frozen, than to lay out a little expense, and have them comfortable. Many think to save labor, but it requires as much, if not more, to winter a lot of cattle out in the storms, as to keep them in stables, where they will be comfortable. I say, for one, and that truly, that it will not cost more than two-thirds the labor and expense, to winter all domestic animals

with protection, than it does exposed to the cold and bleak winds of our variable climate. A great many farmers, who are in the habit of raising fine horses, are very careful that they are well fed, and have warm and comfortable stables, but think their cows and sheep can do well enough, without any thing to shield them from the chilling winds of winter; and thus are permitted to remain five or six months. In this way, we cannot expect to see good cattle, because it will require all summer to recover. But if domestic animals are kept in good condition through the winter, and in good heart in the spring, it will not require much attention through the summer, to have them thrive and grow into money very fast; and amply repay the husbandman for his kind services.

In Chaptal's Agricultural Chemistry, page 286, he thus describes the buildings in which domestic animals can be healthy: "That the habitations of domestic animals may be healthful, it is necessary that they be spacious enough, not only to allow free respiration, but to permit the inhabitants to assume all the positions natural to them. It is likewise necessary they should be ventilated: this may be done by means of windows or doors placed on opposite sides, so as to form a thorough draught of air; through these, respirable air will be constantly brought in, and the pernicious exhalations as constantly carried off."

If all farmers would adopt the above method, there would be but little complaint, in our country, about cattle. But rather than do this, the fact is, they want to be sleigh-riding, and leaving the management of their stock in the hands of those who care but little about them.

Cattle ought to be supplied with a plenty of pure water in winter; and if they do not have it, they will run down hill. They need more water in winter than they do in the summer, because their food is very dry, and therefore causes great thirst; and if that cannot be quenched, they will greatly suffer. There are many farmers in this section, who are not supplied with running brooks; therefore they are under the necessity of digging wells to supply their stock with water. If a farmer is compelled to dig for water, it is highly important that he should select the most convenient place, which, in my opinion, would be in the barn yards, and thus save the cattle from going to and fro through the mud to obtain it. One great thing, in my opinion, that causes the hoof ail to be so prevalent among our horned cattle, is their going a half or three quarters of a mile to get water, getting their feet into the mud and water, and thereby they are frozen, which, in my opinion, is the only cause of the hoof ail.

The winter food for domestic animals is an article of importance, both on account of the quantity required and the value. There is scarcely any place where good hay will not, at some season of the year, bring several dollars a ton. Every means, therefore, by which it may be saved, or the nutriment it contains applied to the best effect, should claim special attention. It has been asserted that by cutting all kinds of fodder before feeding to cattle, at least, in my opinion, one half is saved; but supposing it saves one-third, it is very evident it would, in a few years, amount to no small sum, where there are a considerable number of animals wintered. The labor in cutting fodder for a lot of cattle, to be sure, is something, but it is nothing, when we can have a good straw cutting machine for the purpose. Among the best now in use, is Green's patent. It does the work exceedingly well, although it is turned by hand; however, one man is entirely sufficient to turn it, and cut all the fodder that another can put in, working with activity too, and having the hay or straw close by. Two bushels of fodder can be cut in a minute, though sometimes it requires to be cut over twice to make it fine enough for use. The expense of cutting fodder is very small, and if driven by horse power

would be *trifling*. All our coarse fodder might be saved, especially our corn stalks, (which very often are entirely wasted,) by cutting them up in a straw-cutter, and mixing a very small quantity of meal with them. Yet, notwithstanding all this, what a vast majority pursue the old wasteful course of foddering about stacks, and throwing their fodder into the mud, to be trodden under foot and wasted. If a farmer wishes to prosper in his pursuit, he must, of course, have a great deal of care upon his mind, and see that his cattle and sheep are well taken care of; and a good supply of food, as often as twice or thrice a day, given them.

Some suppose that swine can provide for themselves in winter, only let them have free access to an orchard, where, perhaps, a very few apples were left at the time of gathering, in autumn. But it would be altogether impossible for farmers to winter swine so in this country, (where the snows fall so very deep,) if they did have a free access to an orchard—I care not how plentifully the apples are, or how ample the orchard—they would, in my estimation, come out, as the old saying is, at the little end of the horn in the spring. Swine need a warm and comfortable place in winter, and then a very small amount of food will keep them in a good condition through the winter; and when spring arrives they will look fine, and therefore thrive much faster than those that are wintered out in the cold and stormy weather, with twice the quantity of food given them. Therefore a neat is gained by having warm and comfortable places for the protection of swine, through the inclemencies of our winter seasons.

Enough has already been said to convince the farming community that the protection of their domestic animals, in the winter, is one great thing that will, in the end, conduce to their prosperity in future years.

Respectfully yours, W. S. T.

South Venice, January 16, 1840.

AGRICULTURAL IMPROVEMENTS.

In the retrospect of the past, we find that agriculture has received a greater impulse during the last twenty years than in double or treble that period previously.—that during this space of time, scientific knowledge and enlightened education have been brought to bear upon the subject, and in putting theory into practice, the narrow prejudices contracted by the world at large, have been thrown aside. Science has clearly demonstrated that in this pursuit there is an ample field for the exercise of the clearest faculties, and the deepest scientific researches, calculated to afford enjoyment to those engaged in it, and fully reimburse their expenditures.

This march of improvement is not stayed,—happily we may safely assert, that at no point of time was it more in the full tide of progress than at the present, and no limits can be set to its advancement. To quicken it, our farmers themselves must lay hold of the matter; they should individually feel that a portion of this work is assigned them—that they are called upon as integral parts of a great community, to further its interests, by the means which they severally have at command;—they should be willing, impartially, and unbiassed by old prejudices, to canvass all their actions, and bring them to the test of reason.—They should not suppose that in any one particular they have reached to ultimate perfection, but keep this always in view as the point to arrive at.—*Farmers' Cabinet.*

Bee Moth.

Mr. James Thatcher, author of the "American Orchardist," &c. &c., in a communication to the *New England Farmer*, says, "I will embrace this opportunity to communicate, for the benefit of the cultivator, what I believe to be an infallible remedy against the bee moth, which has proved so destructive to bees throughout our country of late years. The remedy is simple and easily applied. It consists merely in covering the floor board on which the hive stands, with common earth, about an inch thick. A hive set on earth will never be infested with worms, for the bee moth will not deposit her eggs where the earth will come in contact. She naturally resorts to a dry board as her element. The remedy has been employed by a number of persons in this vicinity for several years, with the most complete success."

For the New Genesee Farmer.

On the different varieties of Grass and Clover.

Messrs. Editors—Believing that a mutual interchange of our opinions, through the medium of the New Genesee Farmer, is of great advantage to us farmers, I will offer a few remarks on the different kinds of grass and clover used for hay or pasture in this section.

Red and white clover, timothy or herds grass, red top and June grass, are the principal kinds known or used by farmers in Western New York.

June Grass, (*Agrostis vulgaris*,) is considered much more injurious than beneficial. It is never sown by farmers, but it seeds and spreads itself so abundantly, that it appears to spring up spontaneously in most of our cultivated fields. It yields but very little pasture, and is worth nothing for hay. It is difficult to eradicate, and is very injurious to cultivated crops. In short, it annoys the cultivator and injures the land, without yielding any profit in return; and it would be well for Western New York if it was wholly exterminated.

Red Top, (*Agrostis stricta*,) is sown to some extent in this section, particularly on moist soils, for which it is better adapted than timothy. It produces plentiful crops of hay on such lands, but is of little worth for pasture. I do not think the hay contains much nutriment, although some intelligent farmers think differently. Sheep can scarcely live on it, and cattle and horses do not thrive well though fed on it plentifully. It also impoverishes the soil and is difficult to eradicate, consequently it is injurious to grain-raising farmers.

Timothy or Herds Grass, (*Phleum pratense*,) This is a most valuable grass for hay or pasture; and on good soil it yields heavy burdens. When intended for pasture, it always should be sown with white clover, as the two together make the best and most nutritious pasture. They do not impoverish the soil, unless when suffered to remain too long without ploughing, as is frequently the case.

White Clover I consider more nutritious than any other kind. It is very valuable for pasture, especially when intended to remain long down. If the bottom be smooth so as to cut it close to the ground, it yields tolerable burdens of hay; but, as before stated, its chief excellence is for pasture, and it ought always to be sown with timothy. White clover springs up so spontaneously in most of our lands, that it is seldom sown by farmers in this section—although I believe it would be of great advantage to the farmer; as it would then start with the timothy, and while the ground is fresh and in order. It is easily eradicated, and it cleanses and enriches the soil, so that I consider it of great advantage to the farmer.

Red Clover.—This is by far the most valuable to wheat growing farmers, and cannot be too much cultivated. It cleanses and enriches the land, and is, in reality, the great renovator of our wheat soils. Owing to its more rapid and succulent growth, it is not so nutritious for pasture as the white clover; but what it lacks in quality, it more than makes up in quantity. It yields an abundant crop of hay which is very good for sheep and cattle. Horses are also fond of it, and it is very good for them if it is preserved free from rust or dust, which is rather difficult to be done.

There are two, and some say three, varieties of red clover, the Small, the Medium, and the Large. Farmers are not all agreed as to the relative value of the different kinds, particularly for hay. I prefer the large kind for all purposes, especially on a hard dry soil. It is more luxuriant and productive, and more cleansing and fertilizing to the soil; and, owing to its stronger and deeper roots, it is less liable to suffer from frost or drought. When red clover is intended to remain for hay more than one year, timothy should

be sown with it. The large clover and timothy come to maturity at about the same time, so that the full benefit can be obtained from both. When the large clover is intended for mowing, it should be pastured awhile in the spring, so as to reduce its growth and prevent its lodging. It may be pastured till midsummer; and it will afterwards yield as much hay as the small kind. I find this early feeding of much advantage to me, especially when I have a large flock of sheep. I frequently pasture my clover meadows until the 20th of June; and this past season I pastured one piece until the first of July, and mowed it after harvest, and it then yielded me full a ton and a half to the acre. If the land is poor, and the season dry, it will not answer to pasture so late, nor will it do so well with the small kind as the large. The small kind should be mowed early, and it may be cut a second time in October, or it will afford good pasture in autumn. This is an advantage to those who have time to make hay before harvest. Those who want much clover hay, will do best to sow both varieties, as the difference in time of maturing allows a longer time for cutting and securing the hay which is a great advantage, as it is very essential that all clover should be cut when in full bloom, or as nearly so as possible.

WM. GARRETT.

Wheatland, Feb. 22d., 1840.

For the New Genesee Farmer.

Messrs. Editors.—Being a reader of the old Genesee Farmer, and perceiving the establishment of the New, I thought I would give my opinion on the best way of improving new farms, especially on a thin and clayey soil. They should always be seeded down at the first or second crops with clover, where intended for ploughing; but with clover and timothy, when for meadow. Clover is much more easily subdued with the plough than timothy, especially if such land is wet. Many think if they lay their land to clover, they will reap but little benefit from it; but they are under a mistake. Let them stock with cows; and see the profit when one cow can summer on an acre of grass, and winter on another. If rightly managed, at a low calculation, she will make 150 lbs. of butter in a season, besides raising a calf, (by feeding sour and buttermilk after two months, and grass,) and will make 100 lbs. of pork by feeding a pig.

Butter, at 15 cents per pound, \$22,50

Calf, in autumn, 5,00

Pork, six cents per pound, 6,00

\$33,50

Some may inquire, where is the pay for the labor? I consider every industrious man or woman must use the means for every thing they obtain. Raising wheat is not done without labor; and on lands of this sort, the second or third crop will not average more than from six to ten bushels per acre, besides reducing your land; and in a few years you will be obliged to stock down, or lose the benefit of your land and labor entirely; when by stocking down while your land is good, you are giving time for the roots to rot, so that you may afterwards plough it with greater ease, and by the abundant product you will find yourself richly rewarded for your labor.

I give my opinion on this subject from my own experience. It is about twelve years since I first commenced farming in the woods. I thought at first I must continue ploughing year after year, till I found that raising grain was not what it was "cracked up to be." I thought clover seed so high I could not afford to purchase it; but I found I lost a great deal of time and labor, and that it is not wise to starve our land to make it profitable. Clover should be sown after every third crop, and always after oats, if possible, for there is no crop that reduces our land so much as oats. By clovering and keeping stock, land of this kind is fitted

for all kinds of crops, and for heavy crops of wheat, which exceeds in quality that raised on flat land. I still see the old practice among farmers, "no plaster, no clover, no grain, no stock"—they cannot afford to purchase the materials, their farms will not afford them—well, if they do not commence, they never will be able to obtain them by farming.

Tompkins co., 1840.

Agricultural Chemistry.

We offer our best thanks to the Editor of the Farmers' Register, (Petersburg, Va.) for his valuable presents; but at this time would especially notice as one among them, a new and correct edition, in pamphlet form, of Sir Humphrey Davy's "Elements of Agricultural Chemistry," published by our respected correspondent. It is a very important work, and ought to be in the library of every scientific farmer.

From an advertisement on the first page, it appears that this is an exact re-print of the last London edition, copied from that of 1827, which had received the latest alteration and improvements of its illustrious author, after fourteen years observation and discovery since its first publication; and at a later period, notes were added by his brother Dr. John Davy, yet it is remarkable, that all the American editions preceding this, were copied from the early and imperfect edition of 1813.

In this number of our paper, we shall only give two extracts, but if we find room hereafter, we may be more liberal.

The most nutritive Compounds in Vegetables.

"The most nutritive, is gluten, which approaches nearest in its nature to animal matter, and which is the substance that gives to wheat its superiority to other grain. The next in order as to nourishing power, is oil; then sugar; then farina; and last of all gelatinous and extractive matters."

The best time to apply Manures.

"There has been no question on which more difference of opinion has existed, than that of the state in which manure ought to be ploughed into the land; whether recent, or when it has gone through the process of fermentation; and this question is still a subject of discussion. But whoever will refer to the simplest principles of chemistry, cannot entertain a doubt on the subject. As soon as dung begins to decompose, it throws off its volatile parts, which are the most valuable and the most efficient. *Dung which has fermented, so as to become a mere soft cohesive mass, has generally lost from one third to one half of its most useful constituent elements;* and that it may exert its full action upon the plant, and lose none of its nutritive powers, it should evidently be applied much sooner, and long before decomposition has arrived at its ultimate result."

This edition is large octavo, about 120 closely printed pages of two columns, (7½ sheets) price 75 cents single; but five dollars will pay for eight copies. It is not sent to the booksellers to be sold; but those who have friends in congress may obtain it free of postage, perhaps, after they adjourn next spring.

Siberian Hard Spring Wheat.

This variety of wheat was introduced into this section from St. Lawrence co., two years ago, and sold at the Rochester Seed Store. It was sated last year, that a farmer in the town of Wheatland had tested this, together with several other kinds of spring wheat, and it proved superior to them all. The experiments of the past season, although an unfavorable one, fully establish the superiority of this variety over all other spring wheat, not excepting the celebrated Italian. The following account of a crop raised on a farm owned by Mr. Gay, in the town of Gates, near this city, is to the point.

The land was three acres of good sandy loam, on which corn had been raised the year previous. The seed was sown the last week in April, at the rate of a bushel and a half to the acre. It grew very strong and handsome, was but little injured by rust, and did not lodge except in some places where the ground was rather too wet, and would have turned out a very fair sample, but the worm attacked a large part of the

heads, and destroyed some of the kernels and caused others to shrink. Still the produce was extraordinarily, and superior to most crops of winter wheat. A neighbor offered to cut and thrash an acre of the best of it, and take for his pay all that it produced over forty bushels. Only a small part of the crop has been thrashed out, and consequently the exact amount of the produce cannot be ascertained. The sheaves were counted when harvested, and their number was 1600. On thrashing a part of them, without selecting, they are found to yield at the rate of a bushel to 14 sheaves. According to this ratio, the three acres will yield 114 bushels, or nearly 35 to the acre.

A field of the *Italian* wheat, raised on an adjoining farm, was so smutty and shrunk as to be not worth the thrashing, while this Siberian wheat is pure and handsome, and not a particle of smut can be found in it. The millers offer to give within 6 cents per bushel as much for it as they do for common wheat. A sample of this wheat, in the straw, together with the clear grain, can be seen at the Rochester Seed Store and Agricultural Repository.

For the *New Genesee Farmer*.

Borrowing and Lending.

"From him that would borrow of thee turn not thou away."—M^{at}. V. 42.

Messrs. Editors.—That "it takes all sorts of folks to make a world," is a true maxim; and hence we see the use of such a being as "Splitlog," the writer of the matchless article in your last paper.

Why, for all the world he reminds me of the well-meaning woman, who, after living to a good old age by borrowing every thing she used, at length bought a "brand new" pail. "Now," said she, "I mean to be as obliging and neighborly as any other person; but a PAIL I will neither borrow nor lend."

Now, "Splitlog" has no doubt been, as he says, never "a disobliging, cross-grained fellow," but, on the contrary, "a good-natured man, and willing to oblige;" i. e. he, like the good old woman, was always willing to lend any thing and every thing which he *did not possess*; but prosperity has probably turned his brain:—alas! how few of us can bear what we all sigh for as a blessing.—He is now enabled to substitute the pronoun "*my*" for "*your*;" and in musical and sonorous strains, he forthwith cries "avunt! nor presume to meddle with *my* scythe, *my* rake, *my* flail, *my* brake, *my* axe, *my* hoe, *my* plough, *my* crow.—He moreover, "sets up his Ebenezer," puts on his "grit and resolution," declares he "will not be pestered as he has been for a series of years;" he forthwith mounts his "Rozinante" and repairs to "*the city*," to purchase something which he can have the pleasure of calling "*my* beetle."

But alas! in the city his good fortune deserts him. He is evidently "not at home" in the beetle line. He "enquires at the several establishments" without success. He "whews" and "trudges away" from place to place;—whether he inquired at the banks or insurance offices,—the upholsters or the milliners, he does not say. Poor man! his mind was too expensive;—he looked too far off. Indeed, were it not for St. Paul's famous charity chapter, I should be almost tempted to insinuate that he possibly might have found the article he so much desired, where the man found his spectacles after so long looking for them whilst they were on his forehead. At length, however, he succeeds in finding "a miserable flimsy affair," an "ill-shapen smasher, as long as a horse's head;" which, notwithstanding its ugliness, he makes sure of; for it is "called a beetle," and he is thereby enabled to say "hands off from *my* beetle and wedges."

Pardon me, Messrs. Editors, for permitting such a compound of egotism and selfishness to keep me so long from saying, (what I designed to say on taking up my pen,) that *no man can live in society without borrowing and lending*. I never heard of but one

creature who was rash enough to undertake it, and he did "not live out half his days." If "Splitlog" is really about to embark in the experiment, I would suggest that he should—for his own convenience, as well as the benefit of society—together with his beetle and all and singular his goods and chattels, as by him particularly set forth and enumerated—be consigned to some desolate island, where he can be "monarch of all he surveys."

Contending, as I do, that every *member of society* must, from his own nature, and the universal law of custom, both borrow and lend, I had proposed in my mind to submit, with deference, to the consideration of your readers, a few plain, practical rules for neighborhood intercourse in the mutual interchanging of friendly offices in general; but, as you and your readers prefer short articles to long ones, these must be reserved for your next paper. C****.

For the *New Genesee Farmer*.

Importance of a Newspaper.

Messrs. Editors.—In former and better times I was, in connection with one of my neighbors, for several years, in the practice of selecting, in the summer or fall, a choice lot of wethers, and feeding them through the winter for the spring market.

In doing this we found it both convenient and profitable to purchase beyond our own wants, with a view to sell to drovers or feeders who had not time and patience to collect for themselves.

Finding ourselves one year, late in the fall, with twice as many sheep on hand as we could conveniently winter, we advertised the balance in the village paper. The same day on which the advertisement was published we were called upon by a feeder from Massachusetts, who, before he went to bed, closed a bargain for above 300 sheep, at a price which gave us a clear profit of about 60 cents per head. He then asked if we knew of any more such sheep for sale, saying he wanted about 500 in all. We told him our neighbor across the way had some, to whom we introduced him the next morning. Here he purchased 200 more, and was ready to start home before noon.

Before he left, he told us he had, in company with his brother, (who resided in this county,) spent a whole fortnight riding round the country enquiring for sheep, without being able to suite themselves in a single purchase. That they had indeed abandoned their undertaking, and set their faces towards home; but on stopping at a tavern in the village for refreshments, he observed on the table the picture of a sheep in a newspaper. He took up the paper, and on reading our advertisement, wet from the press, they started to see our sheep. "And now," said he, "within less than 24 hours, I have completed my purchase. You have no doubt sold at a profit. I, on my part, am well pleased with my trade. These sheep will be worth, when I get them home, 75 cents per head more than cost and charges. Hence you see the importance of a newspaper." C****.

Ontario co., Feb. 1840.

Rohan Potatoes in Wheatland.

Messrs. Editors.—As I do not think the subject has become exhausted, I will venture to give your readers a few words on the *prolific* theme of *Rohan Potatoes*.

In your last paper I noticed the remarkable success of Mr. John North, with his peck of Rohans. I say remarkable, not because I considered the quantity he produced as very extraordinary, (although it was a good yield,) but because I think he had remarkable success in making sale of them. I have known some experiments made during the past year which in quantity of produce are equal if not superior to that of Mr. North. I let one man have half a peck last spring, and he raised from them 18½ bushels. Another man had less than

half a peck, or what he called three quarts, and he raised 14½ bushels. Another I let have one peck, from which he gave a friend four potatoes, and then raised from the remainder, 26½ bushels. And if the four given away, yielded as well as some that I planted, the whole peck would have produced 32 bushels. Another neighbor planted fifty hills, three eyes in a hill, and dug from them ten bushels. Some of the largest weighed three pounds each, and seven weighed twenty pounds. The land on which these crops were raised, is what is called "oak openings," and not of the richest kind for potatoes. A farmer in the town of Chili, who planted a few of these potatoes last spring, informs me that he is fully convinced that he can raise one thousand bushel from an acre; and intends to make the trial next summer.

Every man to whom I sold these potatoes last year, as far as I have heard from them, is well satisfied with his crop, and some have made very handsome profits from them. I do not know of any one except John North, however, who has asked or expected six or eight dollars per bushel for them this season. I think, with respect to profit, his crop was one of extraordinary merit; and I should be glad if he would inform us of the manner in which he disposed of them to so good advantage. I advertised mine last fall for sale at \$2 per bushel, and have sold a good quantity at that price; yet I have a good supply left for those who desire them.

I am fully convinced that this potatoe needs only to become known, to be approved and extensively cultivated. The small quantity of seed which is required for an acre, (four or five bushels only,) and their unparalleled productiveness, certainly gives them a decided preference over all others. Then their large size and compact manner of growth, renders them much easier to dig than other kinds. Add to this their fine quality, either for the table or for feeding stock, (which is admitted by all who have tasted them,) and it is safe to predict that this root will, in a short time, be more generally cultivated by farmers than any other kind.

R. HARMON, JR.

Wheatland, Monroe co., Feb. 20, 1840.

Domestic Economy.

Restoring Sweetness to Tainted Butter.

Messrs. Editors.—I am not able to answer the inquiry of your correspondent respecting the taste of turnips in milk, as I have had no experience on that subject; but the following simple method of restoring rancid or over salted butter, I have practised with success, and it may be of value to some of your readers.

Cut or break the butter into very small pieces; or, what is better, force it through a coarse wire sieve, so as to make it small as possible. Then put it into a churn with a sufficient quantity of new milk to swim it, and churn it well; then take it out and work it thoroughly to free it from the milk, adding a little salt if necessary, and it will hardly be distinguished from entirely new butter. ANSELMO.

To make Rice Apple Dumplings.

Boil the rice ten minutes; then let it drain thoroughly.—Pare and quarter as many good apples as you want dumplings; then take as many small cloths, and put a portion of the rice, enclosing an apple into each—the rather loosely, and boil three quarters of an hour. Serve with butter and sugar as usual. If you do not believe this is good, try it. ANSELMO.

SEED STORE CATALOGUE.

The new catalogue of seeds for sale at the Rochester Seed Store, is sent as an "Extra" with this No. of the Farmer, to each of the subscribers. It contains many new and rare kinds of seeds; and any of the agents or correspondents who have assisted the *New Genesee Farmer*, may obtain, gratis, any kind which they wish to try by way of experiment. Persons writing from a distance will please name the kinds they desire, and the manner in which they can be sent.

M. B. B.

From the Maine Farmer.

China Corn and Rohan Potatoes, down East.

DEAR DOCTOR—I see that numerous of your correspondents manifest a peculiar affection for Grant Thorburn and his "China Fall Prolific Tree Corn." Indeed they seem to regard it as the most "magnificent humping" of the nineteenth century. If the old "Sweden" believes that it is better to be infamous than non-famous, his present position must give him great joy. I have no doubt that he feels in his pockets all the triumph which his experiment on popular credulity gave him.

Why should the people so abuse him, when they pay daily to be hoaxed, and the intention of the hoax is declared in advance? Why should Grant Thorburn shine out in such deceptive splendor from amid the petty luminaries which twinkle in the world's firmament?

I have had some experience in this China Corn—that is, I have been made the repository of other people's experience, and will, with your favor, bestow a little of it upon your readers.

The farmers on Saco River are good corn growers. They were among the first to bite at the China Tree Corn. A friend of mine who cultivated a garden patch—purchased, last year, in Hallowell, at the rate of a cent a kernel. He, of course, believed that he had got his money's worth—and I think now, is gratified that he did not get more for his money—for more would have been a misfortune. He got just enough for his money to test the cheat, and I guess was fully satisfied on that head with his bargain. I used frequently to visit his garden for the purpose of watching its growth and development. I saw, first the "blade, then the ear," but never was my sight blessed with the full-ripe corn upon the ear. My friend was proud of his rod of corn, though it was only a rod in pickle, and used to expatiate upon its luxurious growth in glowing terms. Nature proceeded in this way until the ear began to form. This did not appear, as was confidently expected, upon the ends of the promised branches, but grew close upon the main stalk, and stuck close to its side, as a man's rib. This opened his eyes to the deception which he had purchased, and paid for. In addition to this, it was plainly evident that Jack Frost would do the harvesting. Then it was that the tide turned, and I was requested to blow up the China Tree Corn in the newspapers. It was, however, too late, for it had blown up of itself. Almost all our farmers on the Saco got more or less of this corn. One man purchased five dollars worth, and gave up to it almost all the land he had intended for his corn crop—others purchased and distributed in small parcels of a dozen kernels to 'the neighborhood.' The determination seemed to be that this blessing should be as widely diffused as possible. It was early a marvel to me how there could be such an abundance of this new variety the "first year." Joseph's Egyptian granary, which contained a seven year's supply, could hardly have answered the drain which was made upon the little Long Island patch. It seemed to realize anew in a more remarkable manner than the poor widow's oil-cruise—for the more there was sold, the more there remained to sell. It multiplied, though it has failed to replenish itself from the earth in our region.

The Tree Corn was the butt of much merriment, and the wags found it more fruitful, for their purposes, than it was recommended. To them it yielded more than a hundred fold. It was truly "prolific" in causing fun and humor. During the latter portion of the summer, it was at all times a standing joke of "the tallest kind." One man declared that if his had turned "other way, it would, in the course of the summer, have gone down to China. On one man's land it "turned out a box," while his next neighbor's patch did not "turn out at all," and in the garden of gardens, the pride of the village, it "turned out tall." Our man was complimented on the luxuriant growth of his sap-lings—and generous offers were made to secure *stumpage*. Another was asked whether his tree-corn would *surrey or measure* to the best advantage. It was recommended to the Pigwacket farmers as the best corn for them, as they could "tree hoar" on it. Time, space, and patience would fail me to record even a moiety of the jokes which were coined on this matter. They are, however, worthy the attention of some modern Joe Miller, and deserve to be *corned* down for preservation and use.

The corn-planters were variously affected, as their dispositions were various. Many laughed, while the more testy, when reminded of their crop expectations would like Commodore Trumion, let off an oath to ruffle the current of their speech. Some were for running Grant Thorburn "up a tree" higher than that of

Haman. Indeed could the old man have heard a few of the many imprecations poured out upon him, he would have begged a "Tyburn Tippet" and permission to do his own hanging—and perhaps, in mercy, Grant's petition for this purpose would have been granted him, and care taken that he should have perfected his own execution.

There were others who practised upon the poet's maxim:

"Meth always should good fortune meet,
And render 'e'en disaster sweet."

These were willing, as a return for Grant's benevolent enterprise, that he should be granted titles from all the crops, on condition that he would gather them himself.

In this way matters proceeded until Jack Frost took the crop into his own hands—and he at once *cropt* short its existence. Early one October morning he whispered something in its ear that chilled its very life blood to freezing, and curdled the sweet milk of kindness which nurtured its bosom. Then those who speculated on the "rise of stalks" during the summer, began to count the loss occasioned by their anticipated fall, in autumn. If the corn did not ripen—there was much ripe humour expended on it. If it did not get dry to cut up—there were the more jokes "cut and dried" and traced up on its account—on Saco-River the last was emphatically a "Tall-corn" year. This corn was all and more, than it was "cracked up to be."

Then there were Rohan potatoes. But these were no hoax. They were planted in little patches about our "diggings" and in the end dug well. "Look here Tom," said a friend of mine, as he examined a gigantic Rohan from the earth—"Don't that make your Irish mouth water?" I was fain to confess that made into Irish Whiskey, and smacked off with the smoke of the pipe fire, it would smack right well—and even if he would get a good bake on it, I promised not to be mealy mouthed about buttering and eating it. The way the little potato hills elapped their hands for joy, was mirth inspiring, truly. The murphies were "good nice big 'uns," and a good many of 'em in a hill.

But I have exceeded by far the limit which I proposed myself, and will stop here, for fear I shall get off my sheet and not get into yours.

Yours truly,

SALATHIEL.

From the Albany Cultivator.

Of Stock, and the Manner of Feeding.

I have learned that a good cow, in good condition, will more readily sell for forty dollars, than a poor cow, in low flesh, will bring twenty dollars. A good cow, well fed, is more profitable than two poor ones. Hence the importance of keeping such stock as will pay well for first rate keep. We are too careless on this subject. A great proportion of the farm stock is of that worthless character, that its best returns will not pay for the food it consumed. But still, I believe there is more carelessness and indifference, more censurable negligence, and perhaps greater call for reform, in the manner in which our stock is protected and fed, than in the quality of the breed. Within the last two years, in the course of business, I have visited many farmers in different parts of the country, and for the most part during severe winter weather. I have been into the house, barn, cattle yard, and fields; and I am ashamed to tell the result of my observations. I am exceedingly mortified to see, and even to think of such slovenliness and poverty, even among men esteemed respectable. I mean not, however, poverty absolute, but poverty of the ewsens of cattle, sheep, and horses. And, sirs, I would only whisper these facts to you, were it not that I believe there is a remedy. And that remedy is in diffusing information.—And I feel it my duty to proclaim such facts upon the house-tops. I would go into the minutia of such management. I would draw such a picture of improvidence and recklessness, as should prove a looking-glass, in which every farmer, if he saw not himself, would at least see more or less of his neighbors.

And first, of the cattle yard, which, in some cases, was a lot of six, eight, or ten acres, and the barn somewhere near the centre. In other cases there was a pretended enclosure about the barn, but did not afford the least hindrance to all the stock, from rambling the whole farm over in search of scanty food and water. In these cattle yards I have seen dead sheep, which, from the appearance of those alive, one would expect had died of starvation. Colts and calves, which might be expected to be found in the same condition in a few days. Cows which, instead of furnishing the family with milk, looked as if they themselves would require to be fed with milk, to preserve their lives a month longer. Not a stable, cow-house, lavel, or shelter of any kind, to protect them from the chil-

ling winds and storms of winter. I have seen the owner of such a stock of cattle and sheep, scatter hay of the most worthless kind about the yard, which was filled with mud and filth. The stronger of the herd would, with reluctance, eat a portion of the hay, and trample the balance in the filth of the yard; while the weaker were driven away to shiver in the corners of the fence.

Such management I have seen with my own eyes, or I would not believe it. Such, to be sure, is not the general character of our farmers, but far too many would see themselves in the above description. Now, sirs, what do you suppose was the first question I should ask such a man? I will tell you. It was this: "Do you take the Genesee Farmer?" And can you imagine what was his reply? Of course you can.—He says, "No, I do not; I have thought several times I would, but my family expenses are large, and I cannot afford it." "What! not fifty cents a year?" said I. "Suppose you sell one of those pigs for fifty cents, give the same food to the other three, and subscribe for the Genesee Farmer. Here, (continued his visitor,) you have three or four sons, between twelve and twenty-one years of age, and it appears to me exceedingly important that they should have the opportunity of reading and informing themselves of the very great improvements in agriculture, which have been made within the last few years." But all to no purpose—Ignorant he was, and ignorant he will be.

But I rejoice to say I have visited farmers of a different character. And, with your approbation, will give you a little sketch of the management of one of them, with whom I am personally acquainted. I went also into his house, barn and cattle yard, for he had one deserving the name, on two sides of which were barns well filled; on one of the other sides, a good frame cow-house, and on the other side a large stack of straw, and a well-house, covering a good well of water and a pump, and in which well-house were deposited ploughs, harrows, cultivators, roller, wagon, &c. In the yard were good substantial racks for coarse fodder, such as corn-stalks, straw, &c. But no mud or water. This was all absorbed by the straw and litter which was scattered liberally about the yard. I went with him to his barn at night, (for he attends to these matters himself,) to observe his manner of doing things. And when he opened his stable door, first a large pair of oxen, next several cows, all in such condition as butchers would not complain of, marched into the stable, and each to the proper stall, in the most perfect order and regularity, where they were tied with ropes, standing to their knees in dry straw litter. Then he took a basket, and went into a cellar adjoining the stable, and brought out sugar beets, and fed to each milch cow a half bushel, first cutting them in a box standing on the barn floor, directly in front of the stable, with an instrument resembling a large family chopping knife, the edge straight and about fifteen inches in length. In the same manner, and from the same cellar, did he feed to his oxen and other cattle the same quantity of ruta baga turnips.

I requested of this farmer a statement of his opinion of the root culture, and the comparative value of roots and hay; also his manner of wintering his stock. And I was so well pleased with his views and his practice, that I am inclined to give it to the public through the Cultivator. It was in substance as follows:—He says, "In the first place, I keep no more stock than I can keep well. As to the feeding of milch cows, I commence in September with a liberal supply of pumpkins, which I continue until the first of December, and then commence with sugar beets, in preference to turnips, because the turnips give a bad flavor to the milk and butter. The sugar beets I continue all winter, half a bushel per day to each cow. When I put up my cows at night, I first feed them their beets, and in the course of the evening feed them with good clover and timothy hay. In the morning give them corn stalks, and through the day feed with straw, plentifully scattered in the yard. And I find by experience, that I can keep more stock in this manner than to feed hay only. And besides I am doubly paid for the cost of the roots, in the increased quantity of milk. And with this feed, together with good water in the yard, and a decent application of the card every morning, cows are always in good flesh, and, as may be supposed, are always glad to see me. I feed my oxen and calves in the same manner with turnips.

"My manner of feeding my sheep is as follows:—They are kept in yards well protected from winds and storms. They are fed in boxes made perfectly tight, very accessible, and yet so constructed that they cannot get into them. In these boxes I feed in the morning, at the rate of one peck of corn to a hundred sheep, and at evening $\frac{1}{2}$ bushels ruta baga turnips, cut fine and salted. This is all the feed they get except a libe-

ral supply of straw of the different kinds scattered about the yards."

Perhaps some of your readers may at first object to this manner of feeding sheep, thinking the expense greater than to feed on hay. But suppose we make an estimate for 130 days, say from 1st. Dec. to 1st. April. 130 pecks of corn, or 3 $\frac{3}{4}$ bushels, at 4s. \$16 25
195 bushels turnips, 1s. 24 38

Total expense of keeping 100 sheep 130 days, \$106 37
It is generally estimated that ten sheep will consume as much hay as one cow, and some think more, which, at 1 $\frac{1}{2}$ tons for every ten sheep, would require fifteen tons for every 100 sheep, which, at \$10 per ton, is..... 150 00

Then would there not be a saving of..... \$106 37 in the keeping of 100 sheep for one winter?

Again. Suppose we compute the quantity of land which would be occupied in these two cases. Fifteen tons of hay, at an average yield of one and a half tons per acre, would require ten acres of land to furnish hay for the hundred sheep. But at a very moderate calculation, one acre of corn will furnish the 3 $\frac{3}{4}$ bushels, and the corn fodder in the bargain. And one-fourth of an acre of turnips will furnish the 195 bushels. Thus have we not 8 $\frac{3}{4}$ acres of land appropriated to other purposes? Or, if you please, let us put eight of the ten acres to corn, and the other two acres to turnips, and we shall have the means of keeping eight hundred sheep from the same quantity of land which would be required to keep one hundred upon hay; and the manure of the eight hundred sheep will keep the ten acres of land in good condition.

But enough for the present. Should you deem such communications conducive to the agricultural habits of the farming community, you may expect again to hear from your friend,
NIAGARA.

Who is independent?

Is that person independent who cannot satisfy the demands of a rational appetite without having half a dozen persons employed half of each day in torturing nature's plain, simple, healthy viands, into instruments of dyspepsia, fever, liver complaint and consumption?

Is he independent who cannot eat bread unless it is just from the oven, hot enough to burn out his very vitals; or meat unless it is rendered diseased by stult feeding and cramming, swine in gravy, and is covered with mustard and pepper?

Is it a mark of independence when a man cannot drink nature's purest, simplest, best—nay her only beverage—until it has been poisoned by a foreign narcotic herb or embittered by some filthy drug, or mixed with from four to fifty per cent of rank poison?

Is he the independent man—whether he ploughs or preaches—who cannot speak until his sounding box has been besmeared with snuff, both internally and exactly; or until he has converted his mouth into a sty, his nose into a chimney, and his lady's parlor floor and atmosphere into something which has no name in the English language?

Is he the independent young man, or she the independent young lady, who cannot forego the delights of celibacy, till late, not only to ride to church, but into the garden, in a coach and six, maintain a dozen domestics, and dwell in a palace?

Is he independent who cannot walk on the legs which nature gave him, except in dog-days, four rods without being clad in a Greenland dress, for fear the air should hold in solution some staggering particles of moisture, which might reach his lungs, or without India rubbers to keep the dew from the thick cuticle of his feet; nor ride, unless the carriage is so tightly covered as to entirely exclude the air?

Is the robust young man of eighteen or twenty, independent, who cannot go abroad in winter without wrapping himself up like an Egyptian mummy in a cloak without sleeves, or cannot walk in summer without an umbrella?

Is she the independent mother who has so much to do of greater importance, that she cannot find time to take care of her own babe; but must leave it to the disposal of those who will only take care to ruin it?

Is she the independent, valuable and happy housewife, who cannot for the life of her, break an egg without her husband to help her; or shave all, stoop so low as to wet her delicate hands in dish water?

Is she the independent female, who, (worse than the ladies of the Celestial Empire, that only brace their feet, or the parents of Charles II., that only brace—with steel boots—his feet and legs,) under the idea of affording support to her chest, dresses so tightly as to restrain the motion of those vast organs the

lungs, and thus prevent free circulation of the crimson tide whose purity is indispensable to cheerfulness, happiness and health?

Are they independent pupils at school who cannot study unless their books are prepared in the way of question and answer;—and unless, to prevent mistake, the questions and their appropriate answers are marked by the kind, indulgent, and excellent teacher; and who cannot read either at home or at school, a book that is not presented in language so plain as to save all trouble of looking into a dictionary?

Are they independent, in short, who, though they cannot deny themselves the smallest gratification, in compliance with the requisition of God's laws, or to promote the happiness of their neighbor, will yet submit to die by thousands and tens of thousands, the willing martyrs to the tyrant fashion, however unenforceable may be her mandates, or however arbitrary her decrees?—*Moral Reformer.*

Speculation.

This word has become absolutely odious to almost all the sober and reflecting part of the community, and cannot sound very melodiously in the ears of many who can lay no claim to being either sober or reflecting. It is no better in general than arrant gambling; and its tendency is to disturb all the common pursuits of fair trade, and stop the operations of wholesome industry. A man who lives by speculation entirely, is in general living upon the necessities or weaknesses or ignorance or follies or vices of other men. This is a poor trade; and such men are commonly the curse of the community. A man buys a piece of land to-day, and sells it to-morrow for twice as much as he gave. The next purchaser gets an advance upon it, and so it passes on through successive hands, without any improvement of any description whatever being made on it. Now who is benefitted by such an operation? The community is not, most certainly.

A man buys into some public stock. He to-morrow sells his shares to another man at an advance; and so it goes on, passing through various hands without any change whatever in the property disposed of.—Now who is benefitted by this operation? Certainly not the community, for not a cent of intrinsic value is added to the property. No wealth is created; and no increased value is given to the property in question by the operation, let the transfer of the property pass through ever so many hands. But there is a serious injury to the community by all such operations. They excite extravagant expectations. They induce men to desert their farms and their trades, that by some chance adventure they may get rich without the slow processes of frugality and labor. Successful speculations of this nature, too often ruin the operator himself, either by inducing him to hazard every thing in a single cast of the die, or hurrying him on in his misdirected prosperity into deeper kinds of gambling, and too often impelling him into courses of extravagance, luxury, dissipation and profligacy, absolutely ruinous and dreadfully fatal.—*New Eng. Farmer.*

From the *New York Sun.*

Important Facts.

We observe with astonishment and regret, the conclusive evidence which appears in every direction, that the business of agriculture does not receive the attention due to it in this country, but is treated with absolute neglect compared with other pursuits. This ought not to be, and the inhabitants of this country will yet learn, that they have committed a gross error by abandoning the cultivation of the soil, for less independent and more precarious modes of obtaining a livelihood.

Who has ever heard of such a state of things as now exists here? We have a soil as fertile as the sun ever sows upon; a country almost boundless in extent, and so cheap that any man may purchase a farm with the proceeds of a few months labor, yet we are actually importing for consumption, immense quantities of agricultural products from foreign countries! A people thinly scattered over a land unequalled in fertility, and exhausted in its resources, are buying their bread at enormous prices, from countries so overburdened with inhabitants, that political economists have feared that the earth would fail to produce sufficient to support them. Such an extraordinary and unnatural circumstance should excite attention and awaken the inquiry as to its cause.

The fault, as we have seen, is not in the soil, nor is the country overrun with inhabitants. It is, therefore, evident that the cultivation of the soil is neglected, otherwise we should be exporting agricultural products; but it is easier to show the fact, that agriculture is neglected, than to find a sufficient reason for this neglect. We apprehend, however, that it will be

found to spring, in a great measure, from the same causes which have produced much evil in this country, and the bitter fruits of which we are now reaping.—The first and chief of these causes is the inordinate thirst for wealth, which pervades every class of society, and induces men to abandon their legitimate business to engage in some wild, hazardous speculation, in the hope of becoming suddenly rich. It is also too often the case that the farmer becomes tired of the moderate and gradual accumulation of property by the products of his land, and leaves the cultivation of it to engage in the business of commerce or manufactures. He finds out his egregious mistake when it is too late. The property he had accumulated is often squandered and lost in consequence of his ignorance of his new business, and he again sighs for the cheerful and independent mode of life which he has abandoned, when it is out of his power to resume it. We have in our mind numberless instances of this kind, where industrious and prosperous farmers have been lured to their ruin, by being induced to lay aside the implements of husbandry, and engage in the universal scramble after sudden wealth.

There is another great error prevalent upon this subject, and that is, the business of agriculture is generally looked upon as less respectable than that of commerce, manufactures, or the professions; and wealthy farmers, instead of teaching their sons their own business, most usually transform them into merchants, lawyers, doctors, or dominees. This is all wrong.—Agriculture is the very back-bone of all business, the main-spring of all wealth, and should be regarded as a profession of the highest respectability. It gives those who are engaged in it a feeling of independence, genuine nobleness without ostentation, honor, honesty, and firmness, well calculated to perpetuate the free institutions of our happy country. The truth of the eloquent panegyrics of the ancients upon this employment, may be more easily realized here, than in any other country upon earth. We confidently hope to see public opinion speedily righting itself upon this subject, and to find people seeking their permanent interests, and advancing the prosperity and glory of our wide domain, by engaging more generally in this healthful, honest and independent business.

Barley Hores.

"A truckman in Boston, that had a refractory horse that would not draw or move forward, beat him most unmercifully. A gentleman came along, who told him he must not beat him any more. 'What shall I do?' said the man, 'my horse has stood here these two hours. Shall I stand here all the day?' 'Oh no, the horse must go, but you must not beat him any more. Get me a rope, twice as long as the horse.'—The rope was got, secured to his tail, and then passed between his legs forwards, then a smart pull on the rope was given. The horse was frightened and showed symptoms of kicking, but the pulling was continued. Suddenly he started forward, and went off without any more beating. The gentlemen had seen that method tried on that most refractory of animals the Jackass of South America. If you question this, you that have obstinate horses, try it for yourselves."

GOOD SENTIMENTS.

Agriculture is the nursery of patriotism.

Agriculture, aided by science, will make a little nation a great one.

Science must combine with practice to make a good farmer.

A wise government will not be slow in fostering the agricultural interest.

Let every farmer who has a son to educate, believe and remember that science lays the foundation of every thing valuable in agriculture.

The opposition against book farming rests on the shoulders of two monsters, ignorance and prejudice.

If you separate science from agriculture you rob a nation of its principal jewel.

All the energy of the hero, and all the science of the philosopher, may find scope in the cultivation of one farm.

Kings never hear the voice of truth until they are dethroned, nor beauties until they have abdicatd their charms.

A gentleman observed upon an indifferent pleader at the bar, that he was the most affecting orator he ever heard—for he never attempted to speak but he excited general sympathy.

The most foolish thing in the world is to bow to the rich till you're unable to stand before an honest man.

Honest industry is, after all, man's only sure dependence for the double blessing of a contented mind and a comfortable livelihood.

An humble man is like a good tree, the more full of fruit the branches are, the lower they bend themselves.

NEW GENESEE FARMER.

MARCH, 1840.

Hints for the Month.

If the repairing of farming utensils has hitherto been neglected, it should now be attended to. Such work may be done on stormy days without interruption of other business. See that ploughs are in good condition for use, have good points, that no pins are lost out, the beam sound, and the handles firm. See that your hoes and forks are well provided with handles, your rakes and harrows with teeth, and that your harness is well oiled and in good repair. In procuring tools, be careful always to get the very best, though they may cost a little more. A good tool, that is much used, pays for its extra price a hundred times over by the extra work which is done with it. Provide a place for every thing, and be sure that every thing is in its place, by the time that the busy season of spring commences, in order that no time may be lost in long and fruitless searches.

Procure a pot of paint and a brush, and paint all your tools, your hoes, rakes, forks, ploughs, harrows, cultivators, spades, and shovels. The cost of this is very trifling, and it will, in most cases, make them last many years longer, especially if effectually done at the joints and accidental cracks, where moisture is apt to penetrate and cause decay.

In open weather, repair fences, lay up the fallen stones of walls, draw manure from barn-yards, and clear away and draw off old chips from about your wood houses,—if large, lay them aside for burning in summer, and if small, put them on land for manure. They are also excellent for putting round young fruit trees, to prevent drouth and the growth of grass and weeds.

In wet or thawing weather, examine the water furrows in wheat fields, and see that they are not obstructed by snow-banks, nor by crumbling earth. A want of this attention is often followed by large pools of water standing on the fields, and many a bushel of wheat has been lost which might have been saved by the work of an hour.

Every good farmer has doubtless drawn wood enough for the following summer—if it is not cut for use, let it be done during stormy weather, and pile it up neatly in the wood-house.

Now is a good time for cutting grafts—be sure to get good kinds—it would be better to travel ten times as far for them than get poor ones. Make grafting plasters—unsized paper is as good as cloth for spreading the wax on, and much easier made. Grafting may be done in cold weather, by having something always at hand to warm and soften the wax just before applying. Where but little work is to be done, a hot brick or block of wood, or a vessel of hot sand, will do; but we prefer a candle or lamp placed in a lantern. The most convenient is the common glass lantern, the plaster being held over the chimney in the current of hot air, where they become softened immediately.

Potatoes in heaps and in cellars should be examined as early as practicable, to see if they have not suffered from the frost. Where they have been but slightly touched they may be saved by sprinkling lime upon them in sufficient quantity to absorb the water under the skin. Those more affected should be immediately cooked in a large boiler for feeding to cattle and hogs.

Every farmer should always receive his best hay for cattle to the latter part of winter, and see that their feed is rather better than before. Let them enter the summer season in good condition. "Cattle well wintered are half summered."

Horses and working cattle especially should have every attention, in order that they may be prepared to endure the labor which is soon to come heavily upon them.

Cows near calving, should be kept housed in cold weather and at nights, and be well and regularly fed. The increased quantity of milk which they will give in consequence, will be ample payment. It is of great consequence at this time that they be kept very clean and well littered. The time of calving may be very nearly known by observing the time of gestation, which is forty-one weeks with a bull-calf, and forty weeks with a heifer calf.

Sheep should have constant care and good protection during the variable weather of this month, and if possible, well fed with roots.

CATTLE AND HORSE BARN.

We frequently hear the practice of keeping cattle in stables, strongly discouraged; and the reason assigned is, that the practice is less cleanly, and the confined air unwholesome. This is indeed true, where they are neglected; but when they are properly attended to, and their apartments sufficiently ventilated, we know this is not the case. A friend who has visited the dairy establishments of the Dutch in Ohio, informs us, that the cow stables are thoroughly washed every day, the animals carried every day, and more pains taken to keep them clean and comfortable, than any farmer here takes with his best horses; for which they are amply repaid by the increased quantity and quality of their products.

Stables for horses, we believe, are very much neglected, both as relates to construction and subsequent condition; and as a small contribution to an improvement in this respect, we furnish our readers with the following excellent plan of a horse barn, taken from *London's Suburban Gardener*, believing at the same time, that many, if not the most, of the principles of the constructions, will apply advantageously to stables for cattle. We would remark that, in relation to the latter, we consider it of importance, both on the score of cleanliness, and for the manufacture of manure, that clean straw litter be copiously used. If frequently removed, we think the objection which London makes to its use, would not apply with much force to cattle, especially during the cold of winter.

"The ground on which a stable is built ought to be dry, either naturally, or by drainage; and the walls ought to be of sufficient thickness to exclude the extreme of heat in summer, and of cold in winter.—There ought to be abundance of light admitted, as well for cheerfulness as for cleanliness; and, independently of the doors and windows, there ought to be suitable openings for ventilation. In the stable there ought to be a wooden tube, at least six inches square, placed over every stall, and reaching from the under surface of the ceiling to the ridge of the roof, with a cap on the outside to exclude rain; and a slide in the ceiling, at the lower end of the tube, to regulate the quantity of air admitted, so as to keep the atmosphere of the stable at about 50° in winter, and from 60° to 65° in summer. This flue will do for the stable of the horse, what the chimney does for the dwelling of the human being. To give a palpable idea of this mode of ventilating, we may refer to the figure in which the ventilating tube, with its protecting cover, is shown at RR; 2 is a corn bin, placed under one of the windows, s is a drain under the floor of each stall, which leads to a

main drain under the gutter behind the horses; these drains having grated openings, each with a bell-trap,* to prevent the ascent of bad smells; T is the cast iron manger; U, the bull's eye cast iron rack, the hay of which is let down from the loft above, through the open space behind. The mode of keeping hay in lofts, over the horses, and letting it down through a space over the racks, which is continually open, is very properly objected to, as contaminating the hay by the breath of the horse; but when there is a raised ceiling with a ventilator, as in the section before us, the breath of the horse rises to the ventilator, and does the hay no injury whatever. At the bottom of the rack there is, in the space behind, a grated floor, which retains the hay, while it allows the dust and seeds to drop into the open space V, whence they can be taken out at convenience by an opening under each stall.—There is a cast iron ramped cap, H, to the boarded partition between the stalls; and a cast iron sill, X; both cap and sill having grooves for receiving the ends of the boards which form the partition. The partition post, Y, is also of cast iron. That part of the floor of the stable on which the horse stands, should always be made perfectly level, with a grating and bell-trap under it, in the centre, for drainage. In general, the floor of the stable should never be covered with litter in the day-time, or when the horse is not expected to lie down; because the litter retains moisture, harbors insects, and produces an unequal surface for the horse to stand on. Stables, as they are commonly kept, contain an atmosphere, charged with an ammoniacal gas from the urine, and carbonic acid gas from the lungs of the horse, which, with moisture from the floor, and other ariform matters, are extremely disagreeable to man; but if the stable were properly constructed, ventilated and drained, kept free from litter during the day, and amply lighted, in the manner we have recommended, they would be as wholesome for a human being to enter and to remain in, as the living-rooms of a dwelling-house."

* A "bell-trap" is made as follows:—A vessel is placed immediately under the grating; through its bottom a tube passes, and extends upwards in the vessel about half way to the top, so that the vessel can be only about half filled with water, as the rest escapes through this tube. Directly over the upper end of this tube, is inverted a bell-shaped vessel, somewhat smaller than the other, so that its rim dips in the water of the lower vessel, and prevents the escape of bad air upwards, while it freely admits water to run downwards through the tube.—Eds. N. G. F.

Gardener's Work for March.

The severity of winter is now mostly past, and this month is called spring. The sun begins to make his power felt, and will soon revive the vegetable world. The gardener will now resume his labors and direct his attention to the production of an early supply of luxuries for the table. The first thing to be done by those who wish to obtain early vegetables, is to construct a hot-bed. The time of doing this may depend on circumstances. If it is desired to produce articles quite early, without much regard to the labor or attention required, the bed should be made early in March; but for ordinary purposes the middle, or latter part of the month will suffice. Every professed gardener knows how to make a hot bed; but for the benefit of the inexperienced portion of our readers, we will give brief directions.

For Making Hot-Beds.

Select a site for the bed, on dry ground, where it will be fully exposed to the sun, but sheltered from the north and west winds. Mark out the size of the bed, allowing six or eight inches on all sides larger than the size of the frame. Then drive down a good strong stake at each corner, as high as you intend to build the bed. Then take the manure (which should be fresh stable manure in a good state of fermentation) and commence building the bed by mixing the manure thoroughly, and putting on successive layers, beating it down with the fork. Observe to place it smoothly and firmly around the outside, so that it will not settle unevenly from the weight of the frame.—The height of manure requisite, will depend on the time at which the bed is formed, and the purpose for which it is intended. If made early in March, and

tended for growing cucumbers, &c., a good deal of heat will be required for two or three months, and at least four feet high of manure will be necessary. But a bed made early in April, for the purpose of forwarding early plants to be transplanted into the garden, will not require more than half that quantity.

The usual size of hot bed frames is either four feet by eight, or four feet by twelve. The former size has two sashes, and the latter three. The frame should be made of good sound boards or plank, firmly nailed or bolted together on corner posts inside. The front should be one foot high and the back about two, so as to give a good slope towards the sun, and carry off the wet.—The sash should be made without any cross-bars, and the glass set so as lightly to overlap each other, in order to allow the rain to pass off freely. (The crevices between the panes at the laps should not be stopped up, so they allow the steam and wet to pass out from the inside, which would otherwise injure the plants.)—The sash and frame should both have a good coat of paint, and they will last a number of years.

When the bed is made, put on the frame, and then ut in about six inches of good fine earth; put on the sash and let it remain two or three days for the heat to rise, when it will be ready for sowing.

Make the earth smooth and fine before sowing; if cucumbers or melons are to be planted, raise slight hills for them under the middle of each sash. The articles usually sown in hot-beds are cucumber, radish, lettuce and cress, for early use; and cauliflower, broccoli, cabbage, egg plant, tomato, pepper, celery, &c., to transplant. The earliest varieties of each are of course the best for this purpose.

Every farmer can make up a small hot-bed, say four feet square, which may be covered with an old window sash. This would produce an abundant supply of early plants for the garden, by means of which many excellent vegetables may be obtained for the table, a month or two sooner than they could be otherwise.

After a hot-bed is sown, it should be carefully watched in order to give the young plants plenty of air, and see that they do not get scorched by the sun or killed by frost. It often happens that the heat in the bed will be too strong at first, and in that case the sash must be raised at the back, so as to let the heat and steam escape. A mat should be placed over the opening to keep out the cold wind. In sunny weather the sashes must be raised considerably, and if very warm, the plants should be shaded during the middle of the day. An hour of sunshine will often destroy a whole bed of plants, if the sashes are closed tight. They are much more frequently destroyed by heat than by cold. In frosty weather, mats or straw should be laid over the bed for protection, especially during nights.—Keep the bed moist by gentle waterings. The water would stand several hours in one corner of the bed, so as to become a little warm, before being used. As the weather becomes warmer, and the plants increase in size, plenty of air must be admitted.

Work in the Open Ground.

The weather during this month is so severe and changeable in this section, that little can be done in the open garden, except making preparation for next month. Manure may be carried on, and dug in as soon as the ground is sufficiently dry, where early crops are to be sown. Towards the latter part of the month, on warm early soils, a few kinds of seeds may be sown, such as Peas, Parsnips, Lettuce, early Beets and Carrots. Plant Top Onions or small onion sets or early use.

Asparagus Beds should be dressed towards the latter part of the month, or before the shoots begin to start. Clean off the litter, if any, and fork up the earth carefully, so as not to injure the crown of the plants. If the earth has become shallow, put on a dressing of good rich mould.

Currant and Gooseberry bushes should be pruned this month. Cut out all old or decayed wood and straggling shoots, so as to admit plenty of light and air, and leave young and thrifty wood to produce the fruit, which will be greatly improved thereby.

Raspberry bushes should also be pruned. Clean away the old stems, and cut off at the ground all but four or five of the strongest shoots in each lump, which should be left for bearing. Shorten the tops of these to three or four feet, and tie them to a stake. Keep the ground about them mellow and clean from grass during summer.

Grape Vines of the hardy varieties should be pruned as early as possible, if not done last month. Tender kinds which were buried in the fall, should not be uncovered before April.

Rhubarb or Pie plant may be forwarded by covering the roots with boxes, or tubs, or large flower pots, and surrounding them with hot stable manure

[Further hints on Gardening, next month.]

Descriptive Catalogue of Turnips.

The proprietor of the Rochester Seed Store, while in Europe last summer, took special pains to become acquainted with the different kinds of turnips; and obtained in England and Scotland, Seeds of all the most approved kinds. Some of these are but very little, if at all known in this country, and the following descriptions, with the accompanying engravings, will give the reader a good idea of the principal varieties:

White Turnips.

Large White Flat Norfolk, (No. 1.)—This, or a degenerate variety of it, is more commonly cultivated in this country than any other white turnip.—When grown in perfection it is very large and productive; flat and rather irregular in shape. It is not as firm in texture, or as sweet and juicy, however, as many others; and is not very good for the table except when young. It soon becomes light and pithy, and consequently is only fit for use in autumn, or early in winter.

White Globe, (No. 2.)—This is more generally cultivated than any other in England; but owing to the opinion which prevails among farmers in this country, that a good turnip must be flat, it is not much cultivated here as yet. Its true shape is nearly a globe, with a fine smooth skin, and small neck. But like most other kinds, it is very liable to be effected and changed by soil and climate. The flesh is more firm and juicy than the Norfolk, and much superior to it for winter and spring use, whether for cattle or the table. (Seed of this variety was imported two years since, under the name of *White Flat or Globe*, and sold as such at the Rochester Seed Store; but the term flat was an error, and should not have been applied to it.)

Long Tankard, (No. 3.)—This turnip is but little known in this country. The roots are long and smooth, grow much above ground, and are sometimes bent or crooked. The tankards are of very quick growth, and consequently may be sown quite late. The flesh, like the Norfolk, is soft and tender, and not good for keeping. There are several sub-varieties of this and the preceding kinds; as the red and the green top—distinguished only by the color of the skin above ground.

Red Round or Red Top.—In shape this turnip is rather more flat than the globe. Roots medium size, smooth, regular shape, bright red color above ground, flesh fine and good. This excellent variety is particularly adapted to light hilly soils. The writer of this saw fine crops of them growing on some of the poor chalk lands in Kent, (England) where, he was informed, no other variety could be raised. It is well worth a general trial in this country.

Early White Flat Dutch.—This is an excellent garden turnip for early table use; but when full grown, it

soon becomes light and pithy. It is of very quick growth, medium size, form quite flat.

Early White Garden Stone.—This is a handsome round turnip, rather below medium size, excellent for the table. It is of very quick growth, but apt to run to seed if sown very early.

Several other varieties of white turnips are worthy of trial, but do not differ materially from the preceding.

Yellow Turnips.

Ruta Baga or Yellow Swedish.—This is too well known to need any description. It is more productive, hardy and nutritious, and will keep longer than almost any other kind of turnip. Consequently it is more valuable to the farmer, and more generally cultivated than any other. There are several varieties of ruta baga, and it is liable to degenerate if great care is not taken to select the best roots for seed. The kind used a few years since, was the green or yellow-top.—This was superseded by the red or purple top variety, which has the upper part of the root of a dull red or purple color. An improved variety of the is now most in use, and found to be superior to all others; the roots are more uniform in shape and size, have a small neck, and a deeper purple color above ground—inside yellow and of fine texture.

Dole's Yellow Hybrid.—This is a mule or hybrid between the white globe and ruta baga; and partaking in some degree of the qualities of both. In hardness, firmness of texture, and keeping properties, it is next to the ruta baga; but it requires shorter time of growth, and may be sown later. Consequently, it is valuable for sowing when ruta bagas have failed or were not sown in season.

Large Yellow Scotch Aberdeen or Bullcock.—This, and its sub-varieties, are deservedly much esteemed and extensively cultivated in Scotland. The roots are large, smooth and handsome; of a flattish round form, firm texture, hardy, and keep well; very good for table use as well as for cattle. There are yellow, green, and purple top varieties of this turnip, with different names.

Yellow Malta.—This is a most excellent turnip for table use, when not overgrown or kept too long. The root is very flat, with a peculiar hollowed or concave form beneath—small neck and tap-root—flesh, a rich yellow color, tender and juicy.

Yellow Attingham.—This also is an excellent garden turnip. Form, globular, a little flattened. Skin smooth, green above ground; flesh yellow, sweet and fine; very small neck and tap-root.

Yellow Stone.—Similar to the preceding; a much esteemed garden turnip.

Early Yellow Dutch.—Similar to the two last, but of a much quicker growth, and more suitable for early sowing and summer use.

Seeds of several other, and newer kinds, may be obtained at the Seed Store, by any person disposed to give them a trial. M. B. BATEMAN.

Giant Rhubarb.

The leaf stalks of this improved variety of Rhubarb, are much larger and better for pies than the common kind. It is now generally cultivated for that purpose in the best gardens in England, where the writer obtained a supply of the seed.

There is still a larger and newer variety, called "Myatt's Victoria Rhubarb," which was raised by a gardener near London, a year or two since. This is quite rare, as yet, and the roots are sold at a very high price. It is said that the seed of this variety will not produce the same kind. I could not learn that any person had raised any of it from seed, or that any of the seed was to be had.

* A correspondent of the "Cultivator" inquired where this seed could be obtained. If the editors will send us his address some seed shall be sent him. B.

New Species of White Clover.

Among the articles brought from Europe by the proprietor of the Rochester Seed Store, is some seed of the *White Alsike Clover*, which was obtained of Mr. Lawson, at the Highland Society's Agricultural Museum, Edinburgh. It is said to be entirely a new species, introduced from Sweden, and not yet disseminated in Scotland or England. It is more perennial than the red and larger than the common white—grows to the height of two feet—stem branching—roots fibrous.—Not much is known as yet respecting its value; but it is expected to prove a great acquisition. Only a small quantity of the seed could be obtained. It will be distributed for experiments. B.

AGRICULTURAL SOCIETIES.

To the Farmers of the State of New York:

GENTLEMEN—You must have noticed that when two men ride on one horse, one must ride behind! It was established by that Bang who made the world, that the producer or agriculturist should ride before, and hold the reins of the common horse. And such was evidently the constitution of the producer and consumer in the early ages of the world. As these companions were compelled to travel together, they enjoyed for a time the order of nature; but when both stopped to rest in the early and dark ages, the consumer seized the reins and mounted before, and the producer has been compelled to ride behind ever since.—Now this state of things ought not to be; and a state of peace and order will never exist on earth, while it continues. A majority of men never can be content while the principles of Eternal Justice are violated to their immense injury.

We now call upon you to begin the remedy: to attempt a cure for an evil which has long afflicted your whole body, and to remove a burden which has long oppressed you. Many of your brothers and producers say to you that the remedy is easy, and will do injustice to no one. It is plain and may be seen by you all. It is only unitedly to say we will govern ourselves, and not be governed; we will ride before on the common horse, or we will travel in company no longer! We will say to those who are neither producers nor manufacturers, God made men to work six portions of time out of the seven of his active existence; and that when he was not in want of so many, or much of the fruit of labor as at present, God placed him in the garden of this world, not to study politics nor metaphysics, but to be an agriculturist. We will say to the rest of mankind, that while we follow the order which God has established, we are not to be looked into the shade or ruled over by those who have abandoned it! We are about to tell you that that class on which all other classes of citizens are dependent for clothing and bread, are not any longer to be ruled by the dependent ones. It is not for want of intelligence among the farmers, but for want of confidence in the knowledge which they have: a confidence which can alone be obtained by associating with their fellows, and participating in the business of deliberate assemblies, that they find themselves neglected. It is a known fact, that a man lost in the wilderness and a long time addicted to solitude, will flee from every man that approaches him! It is this principle of our nature, that makes us imagine that others are superior to ourselves, until we become acquainted with their weakness; and this can only be done by associating with them, where we shall soon find that their talents are diminished by comparison; and your confidence will be increased by a discovery of your own strength.

This is not all that is to be accomplished by associations. Your neighbors have made your laws and governed you, only because you have not placed before your eyes, common objects of action; and when you have had them, you have not been united in the manner by which these objects might be obtained; and therefore they have divided you and ruled you.

In order that you may be united, you must meet and associate one with another. You must form yourselves into a society, and enjoy a mutual interchange of thoughts and opinions. You certainly can unite in mutually aiding each other by a communication of the results of your experience in farming; and union of sentiment and opinion in one thing, will naturally pave the way for union in many things; and the effect of union in your agricultural pursuits will not fail to make you sensible of the importance of union in the business of vindicating your rights. We are well aware that our brethren of the field and mechanic's shop are extremely averse to the business of society makers in general; for they have often been to the community, and especially to the farmers, like dry sponges; they have taken up and absorbed your treasures, and from them nothing afterwards could be squeezed. But still, you must know that the formation of societies is the only way in which you can act in concert, and make your influence to be felt.

We invite you to unite in agricultural societies for other purposes more immediately connected with your employment in life. Nature is not yet half explored; not one half her capabilities brought to contribute to your comfort or happiness. Yes, farmers, it is true that more than one half of the power of the state of New York is yet unused, and a large proportion of it remains so only for want of practical and scientific knowledge how to use it to advantage. The formation of a society is the only way in which the whole community of the state may be benefited by the superior knowledge of the few. It is by coming together

and seeing the great improvements in husbandry, and the adaptation to use of the different improvements, that all can be effectually benefited by them; and it is by coming together and conversing on the best methods of cultivating the earth, and adapting particular means to particular soils, and ascertaining the most valuable seeds, that the knowledge of the few may become universal among you. Punditions may do much, but they cannot do all that is desirable to be done in this respect. Many subjects of valuable information cannot be so placed on paper as to be profitable to you all; and what is wanted cannot be known to those who might be disposed to unite, without such personal interviews as may be had in societies such as those which have been formed in your counties, and in which we invite you to take a part.

We are sure also that by the existence of societies such as have been formed in this state where due notice will be taken of every valuable discovery made by its members, and due publicity will be given to all the improvements that may be made, great encouragement will be given to the enterprise of farmers and mechanics to develop the powers of nature, and to bring to light and useful application her hidden resources of wealth and means of happy living.

And what must greatly add to this spirit of enterprise, will be the substantial reward that may be bestowed by the societies on those who make discoveries in the arts, by which the toil of the farmer is diminished, and the amount of the productions of the earth is increased. How much may yet be done by the discovery of the application of steam power to the purpose of threshing, ploughing, and performing other labors which now occupy much time and strength, no man can tell! Yet such things are on the eve of development, with many others that will soon facilitate the progress of the agriculturist in the acquisition of wealth and happiness. And no one can tell what new seeds may be introduced from some part of the world, which will double the population of the state, when proper encouragement shall be given to the discoveries of such things. —N. Y. Far. & Am. Gard. Mag.

From the Farmers' Register.

Change in Soil Effecting a Change in Plants.

A change of soil may be effected either by removing a plant from one spot of earth to another differing from it in fertility, or by the addition of manure producing a change in the character of the soil in which a plant grows, without changing the location of the plant. The effect of removing a plant from a comparatively barren to more fertile soil, is to increase the size of all its parts, and often to convert its organs of one kind into those of another. Experience has taught us that it is advantageous to supply food to plants artificially. Where increase in the size of vegetables, without reference to their magnitude is desired, it can almost always be accomplished, by affording an increased supply of all the ingredients of the food of plants, distributed in well pulverised soil, in such a manner that the roots of the plants can easily reach it. The effect thus produced, can be greatly increased by additional heat and moisture; and by a partial exclusion of the direct rays of the sun, so as to moderate the evaporation of fluids from the plant. Experience alone can determine to what extent this may profitably be carried in the case of each species of vegetable.—The results which have been produced in some instances are truly remarkable. London states that cabbages have been produced weighing half an hundred weight, apples a pound and a half, and cabbage roses of four inches in diameter, or more than a foot in circumference. By cultivation and a change of soil, the appearance of many trees has been entirely altered. The wild crab-apple, the original stock from which our vast variety of apples have sprung, has its stem and branches thick set with thorns. On removing it to a more fertile soil and more favorable circumstances, all these thorns have disappeared, and their place has been supplied by frailest branches. Yet all the distinctive characteristics of the tree, the structure of its wood and bark, the shape and arrangements of its leaves, the form and aggregation of its flowers, indeed all that a botanist would consider characteristic of the plant, have remained unchanged.

Perhaps the most remarkable changes which result from a change of soil, are those of organs of one kind into those of another. It is by such channels that all our double flowers have been obtained. The organs which are most commonly converted into others, are the stamens, and next to them the pistils. In the hundred-leaved rose, and some other double roses, almost all the stamens have been converted into petals; in the flowering cherry the pistils have been converted into green leaves; in the double columbine a part of the

stamens have been converted into petals, another part into nectarines, whilst a third part have retained their original form. The perfect regularity with which the changes have taken place in the last mentioned flower is worthy of notice. Wherever one stamen has been converted into a petal, a corresponding one has always been converted into a nectary; and so regularly have these changes proceeded, that by careful dissection, you may separate one of these double flowers into several single ones, each perfect in itself, and destitute of none of its appropriate parts. Where flowers have been doubled by art, the only sure way of propagating them, is by some means by which the new plant should be nothing more than a continuation of the old one as by slips or cuttings. Whenever the seed is resorted to there is danger that the plant will revert to its original type, and the flowers appear single again. A change of color also frequently results from a change of soil. Respecting the nature of this change, no fixed laws have been as yet discovered. As a general thing, however, the brightness of the colors of a flower is injured by enriching the soil in which it grows; and hence florists, when they wish to procure tulips of very bright colors, prefer planting the bulbs in a light sandy soil, which is rather poor than otherwise.

Choice of a Profession.

It has frequently occurred to us that our young men, on completing their studies in our colleges, must take the road to usefulness and comfort in preferring the study of some fashionable profession to the pursuits and occupations of rural life. As soon as a young gentleman is admitted to the degree of Bachelor of Arts, his thoughts are turned on the future, and perhaps the first resting place they find is upon the acquirement of professional knowledge of some kind which to him seems the only road to wealth or distinction. Thus we see the science of agriculture neglected by those who are capable of investigating it as should be; and every possible inducement to engage in the improvement of the soil, and to assist nature in what she is wont to do for man is but a feather in the scale of reasoning. And though fear of adopting some pursuit that is attended with a little labor, and as some call it, *drudgery*—but which is the great conducive to good health—resort is had to the study of some profession—which has done, and we fear is doing great injury to our country. We wage no war against professions of any kind; on the contrary, they are indispensable, but it is a fact that it is considered an unpopular step now-a-days, for a young man completing his academic studies, to devote his time and talents, if he possesses any, to the advancement of the cause of agriculture.

We have before us an address, delivered before a young gentleman admitted to the degree of Bachelor of Arts, at the first commencement of the University of Nashville, by its venerable President, Dr. Phil Lindsey—which deserves to be more extensively circulated than we fear it has been—and from which we make the following extract.—*Southern Cultivator*.

"I know not what are to be your future profession or occupations. Every honest calling ought to be esteemed honorable. I address you as moral and intellectual beings—as the patriot citizens of a great public. You may be merchants, mechanics, farm manufacturers—and yet be eminently distinguished and eminently useful, if you will persevere in seeing after knowledge—and making a proper use of it. The Medici—Necker—Renois—were merchants bankers; Franklin was a mechanic; Washington was a farmer. By far the greater part of our countrymen are and must be farmers. They must be educated; what is the same thing, educated men must become farmers, if they would maintain their just influence and ascendancy in the State. I cannot wish for alumni of Cumberland College, a more beautiful, dependent, useful, virtuous, honorable, patriotic employment, than that of agriculture. Nor is there a condition in life more favorable to the calm pursuit of science, philosophy and religion; and to all that previous training which ultimately constitutes wisdom and indelible integrity. Should our college eventually become the grand nursery of intelligent, virtuous farmers, I shall esteem it the most highly favored institution in our country. I have often thought that our college graduates often mistake the true path of honor and usefulness, in making choice of a liberal profession, instead of converting agriculture into a learned profession, as it ought to be, and thereby turning an honest livelihood in the tranquil shade of the country."

It is stated by the Mayor of Boston that one-fifth of the taxation of the city goes to the public schools.

From the Journal of the A. S. S.

Silk Culture--Now is the time to begin.

The price of mulleinis trees having fallen to a very low rate, the present is a most propitious time for the commencement of the silk business, by those who have heretofore avoided it on account of the high prices of the trees. Every thrifty farmer in the Union ought to plant at least one acre of ground--some out-of-the-way old field, some chestnut ridge, some inconvenient hill-side, that yields little or no profit in any other case. It will cost now but a trifle. A thousand trees should be obtained and planted either by layers or cuttings, and there will enough be certain to grow, to occupy the ground. Plant them in rows, four feet apart, and if they grow so that they stand nearer than six feet apart in the row, take up intervening trees and plant them where failures had left open spaces; and if you have still more than the above proportion, extend the field.

In July, they will have grown so far as to enable our daughters, or your female servants or children, to feed worms; and you may then hatch 10,000 eggs. Any common room will do to keep them in, and the first volume of the Silk Journal will teach you how to manage them. When the first crop is three weeks old, hatch 20,000 more, to be ready to take the place of the first as soon as they spin cocoons. When the second crop is three weeks old, bring out the last, the main crop of 50,000 to hatch. As 5,000 trees will produce 5,000 lbs. of leaves, and as each worm will eat one ounce of leaves, your 5,000 trees will feed 80,000 worms, which you will have fed in the above three weeks. As soon as your first crop has finished the cocoons, set a couple of intelligent girls to reeling. You can teach them from the Silk Journal above referred to. The Piedmontese reel should be used. In a few weeks, they will learn to reel as well as you may desire; and then let them take one or two other girls as apprentices to learn to reel. By the time the last crop of worms have spun cocoons, you will have four reels, who will be able to use up the cocoons speedily. The result will be twenty-four to twenty-eight pounds of raw silk, which you can either send to market, or use to be made into elegant silk dresses for your daughters, who have so well deserved them. Next year, double this amount may be made, and every year one two to five hundred dollars worth of silks may be produced without any cost to yourself.

Then why not begin? How hard must a farmer work to produce a hundred dollars in wheat, corn, or hacco; or in flour, whiskey or pork, or any other product. Let us see. He must break up four acres of ground, there is eight or ten days hard work at ploughing and seeding in October. During winter he is staid with promises of good weather, that seldom happens, and in the spring he fears his wheat is 'winter killed;' or, if it escapes that, in March there comes a season of freezing and thawing, that threatens to sweep it out of the ground. Well, it escapes even at, and now the fly flits about, but even that spares not.

The spring passes, and summer with its cradles and rakes, and harvest labor arrives. Six or eight days more of hard labor is again required and performed. The harvest is in the stack, October again arrives, and he flail now tells heavily of six or eight days more hard labor. But the wheat is in the sack, and two or three days more hard labor with the four-horse wagon, required to carry the one hundred bushels of wheat to the mill. The wheat is ground, and the flour in barrels. Well, now we have two or three days' labor with the four-horse wagon again, to carry the sixteen barrels to market, and some time in November, the farmer returns home weary and hungry, with his hundred dollars. Here we have had hard work enough, and time enough occupied too, for a hundred dollars surely. Let this picture be placed by the side of the little coconery of 80,000 worms, and then compare them. But we would not interfere with the growing of wheat, nor with the production of any other staple. We would not take the hardy ploughman from his plough. But while he labors in the field to produce his hard-won dollars in wheat and corn, we could enable the more delicate inmates of his house to add something to his income. And this they will be able to do, if he will only in the first instance furnish them with a small mulberry orchard. Try it, farmers, try it.

G. B. S.

The Farmers.

The following just and eloquent tribute to this meritorious class of American citizens, is from the pen of an eminent New England clergyman:--
"There is one class of men upon whom we can yet rely. It is the same class that stood on the little green in Lexington--that gathered on the heights of Bunker Hill, and poured down from the hills of New England

--which were the life-blood of the nation when the English lion was ready to devour it,--I mean the Farmers. They were never found to trample on law and right. Were I to commit my character to any class of men, my family, and my country's safety, it would be to the farmers. They are a class of men such as the world never saw for honesty, intelligence and Roman virtue, sweetened by the Gospel of God. And when this nation quakes, they and their sons are those who will stand as the sheet anchor of our liberties, and hold the ship at her moorings till she outrides the storm."

English Hay-Making and Hay-Makers.

The following lively and faithful picture of the rural peasantry of England, is copied from Chambers' Edinburgh Journal, and cannot fail to interest many of our readers.

One of the most remarkable peculiarities of the land for a number of miles around London, is the large extent of ground kept in grass for producing hay for the metropolitan market. The hay is generally of a sweet and nourishing quality, very unlike the harsh kind of wry grass and clover which prevail in the northern part of the United Kingdom, where it would be called by the name of meadow hay; and its preparation forms an important branch of rural economy. The hay-making season, which is the busiest in the year, draws laborers from places most remote from the scene of operations, in the same manner as the grain harvest attracts a throng of reapers in other quarters of the country. Those who mow or cut the grass, are almost to a man English laborers; but the other class of workers are a mixture of English and Irish, the former being about two to one of the latter. A Welshman is rarely to be seen among either class, and a Scotchman never.

The hay-making season is from about the middle of June to the third week of July. In the beginning of June, English laborers are to be seen on the different roads, travelling with their faces towards London, each bearing his scythe and a basket or small bundle, the edge of the scythe carefully protected against the action of the atmosphere. These precursors are mowers, men known to be good and worthy workmen, who, year by year, work on the same farm, and until the times of cutting are sure of other work. Day by day the numbers of the travelling laborers increase, and by the middle of June the roads are thronged with them. Some of the English bear scythes, and most of them a bundle or basket; now and then one has a fork, its points guarded with corks. A few of the Irish carry a bundle, but the majority bear no greater burthen than the clothes they wear. At home, and on the road, the English term their emigration "going upwards for work." The English laborers commonly travel alone, or in parties of two, three, or four, and usually leave home with provision sufficient for the greater part or the whole of their journey, and money to pay for decent lodgings at night. On the other hand, the Irish, first congregated on board a vessel, when they reach England, commonly travel in droves, trusting mainly to chance for food and lodging during their travels.

The mowers are paid by the acre. A common price at the beginning of the season of 1839, was 4s. 6d. an acre without beer, but it afterwards rose to 5s. and 5s. 6d. an acre, with beer. The pay of a hay-maker (in distinction to a mower) was 2s. and 2s. 6d. a-day; and afterwards rose to 3s. and 3s. 6d. a-day, with an allowance of beer, some of them finding their own forks. When the hay is spread, or is fit to carry, and rain is expected, the farmers urge all hands to increased exertions by extra allowances of beer, and the promise of a supper. In this district, compared with others, the women employed in hay-making are few, and their pay is commonly 1s. a-day: this is not fair; for, although it is true that a woman cannot take every place in the work, she will, in the lighter portions, perform as much as a man. The boys employed are also few. In fact, very few women and boys are employed but those belonging to the resident agricultural population.

In the beginning and at the height of the season, the public houses and cottages in the district, where lodgers are taken, are crowded with the migratory laborers. Every chamber has as many beds as can be put into it, and the men sleep two, sometimes three, in a bed; in rooms of not greater dimensions than fifteen feet by twelve, from eight to ten, and even twelve men pass the night. The price of lodging to a man who has a bed to himself is sixpence a-night, but when more than one sleep in a bed, the charge for

each is fourpence. If a man pays four nights consecutively, he pays no more that week; at least this is the practice in some places. The Englishmen usually sleep in beds, and the Irishmen in barns, stables, or out-houses, sometimes encompassing themselves in a haycock. A prejudice exists against the Irish laborers, that they are not so clean in their persons as the English, and some publicans make a point of refusing them lodgings. When the Irish hay-makers have women and children with them, they often camp in the lanes, but without tents, there cooking their food, and taking their evening meals; such a case with an English party is very rare.

Beer is the hay-makers' usual drink. They very seldom have recourse to spirituous liquors, and, compared with the workmen on canals, railroads, and in brick-fields, they are generally of sober habits. The Irish are decidedly more sober than the English. When lodging either at a private or public house, each man buys his own food, the cooking being performed, and pepper and salt being provided, gratis. The publicans usually keep bread, cheese, and bacon, and sometimes cooked meat, for sale; at some houses soup is supplied, for which the charge is twopence a basin. Tea and coffee are not commonly used.

Towards their employers and strangers, the hay-makers are civil in manner and language, but with each other practical jokes are not uncommon. The language of the English laborers among themselves, particularly of the young men, is mixed up with many oaths, and horrible imprecations. This species of language is at present dreadfully on the increase, and has not yet reached its climax: for these laborers are still behind the workmen on railroads and canals, inland boatmen, brickmakers, and the like, from whom the contagion has been caught.

Upon their way from home, and at their places of destination, anxious are the inquiries and the mutual talk of the men as to the probabilities of the weather, the state of the crops, the numbers of workmen likely to come up, the prices of labor, and the masters who have and who have not engaged their complement of men. The season fairly entered into, the merits and demerits of the different masters who give the best wages, whose beer is the best, who are most liberal in giving that and victuals, and who look most sharply after their people, are engaging subjects of conversation; but of these, "the beer" is the most frequent; and it is impossible for strangers to conceive the importance which hay-makers, in particular the English, attach to beer, either as a source of pleasure or a help to work. When elevated with this same beverage, their own capabilities are boosted of; and how much, in one day, a man can mow of grass, cut or thrash of corn, fens of strength and agility, and the like, supply matter for noisy but friendly debate. Sometimes the meaning of words and phrases locally used in the neighborhoods of their respective homes, and local peculiarities in manners and customs, especially as regards labor, beguile their leisure hours. With them Saturday nights are times of carousal. Sunday is a tiresome day, not one hay-maker in a hundred attending a place of worship; from singing, or any kind of play, they usually abstain on Sunday, but often get tipsy; and if their master required it, (as is sometimes the case in wet weather,) they would not hesitate to work. Tobacco, in smoking, is used in great quantities; a few chew it; but snuff is only taken in fun, when an elderly mechanic or old woman offers a pinch. To sing huldence, to decide which man shall pay for beer, or a game of skittles, the stake very seldom exceeding a pint of beer, is almost the only gambling in which they indulge; cards are very seldom used. Over the rugs and pipes, a song is a favorite recreation; the music, however, is never, and the words not frequently, of a refined order. Occasionally a song is sung in praise of poaching, after the manner in which war or sea songs set forth the hardships, pleasures, glories, and honors of war and the ocean. The way in which such songs are received, and the heartiness in which all join in the chorus, prove that with the English agricultural laborers, poaching is not considered a crime; though, in talking of poaching, they treat it as a misfortune for a man to have a propensity towards it, and call him a fool for indulging therein. Politics they never discuss. If any portion of a weekly news, or paper be read aloud, it commonly is something which relates to a murder, a robbery, or dreadful accident. Quarrelling, likely to lead to fighting, is carefully avoided; and if a man in this respect lacks discretion, he is expressed by his fellow-workmen, particularly a mower or by fellow-mowers, and remanded, that a fight will probably spoil him for work for a week; not a slight consideration with a laborer, miles away from home, depending upon his daily work for his daily bread.

IMPROVED SHORT HORN BULL SIR WALTER.

The noble animal represented by the above engraving, is owned by Wm. M'Knight, Esq., of this city, and kept on his farm at Paris, in this county, by L. W. METCALF. Sir Walter is now six years old, and weighs about 2,500 lbs. He was raised by Mr. Christy, a celebrated breeder of improved cattle in Northumberland, England, and imported in 1836 by Adam Ferguson, Esq., of Nelson, U. C.

Sir Walter was got by Batchelor, (Herd Book No. 1616;) Dam Sprightly, by Bamptom, (No. 1677;) Grand-dam, by Haverly, (No. 2819;) Great Grand-dam, by a son of Washington, (No. 674.)

It gives us pleasure to inform our readers where such animals as the above can be found; and we hope that the farmers in this section of country will avail themselves of such opportunities for improving their breeds of stock.—[P For Terms, &c. see handbills.

The Agricultural Society and Fair.

The subject of forming an Agricultural Society for the county of Monroe, was brought before our readers last month; and according to a suggestion then made, a number of farmers in this vicinity have given us their views on this subject, and are decidedly in favor of the project. We have not as yet, however, received as general an expression from the influential farmers of Monroe, as to warrant any decisive measures; and those who have given in their opinions in favor of a society, are not agreed as to the best time and manner of forming it. Two plans have been suggested, both of which are plausible, and either of which will prove successful, if the farmers will awake to their true interests.

The first is, that a public meeting be held this spring, to discuss the subject; and if agreed on, to organize a society, and make arrangements for holding a fair next fall.

We think this the most proper course to be taken, provided the farmers feel sufficient interest in the subject to induce them to come together for the purpose.

The other suggestion is, that no attempt be made to get a meeting or form a society this spring; but let general notice be given that an Agricultural Fair will be held at Rochester, next fall, at the time of the Mechanics' Fair; at which all kinds of choice stock and farm productions will be brought for sale and examination. This, it is thought, will bring together the best farmers in the county, and awaken a spirit of improvement which will induce them to unite their efforts to form an efficient Agricultural Society.

This plan will succeed well if farmers will manifest sufficient zeal in the exhibition without the stimulus of awarding premiums.

This subject is of so great and obvious importance to the farmers of Monroe, that we are unwilling to believe they will not give it their attention. All that appears to us to be wanting is, for a few well known influential farmers to lead the way, and set others an example. There are enough who are ready to follow; are there none willing to lead? Are there none who are willing to give a little of their time and influence for this purpose? Does not the present state of our affairs, the condition of our agriculture, and the credit of our country demand it? How many will answer during the present month?

Horticultural Fair, and Premiums for 1840.

The important art of Horticulture has of late received comparatively very little attention from this community. When we consider how largely it contributes to the enjoyment and comforts of life, to supplying our wants and furnishing our luxuries, all must admit that it deserves more attention, and ought to receive more general encouragement.

In view of this subject, it has been proposed that a Horticultural Exhibition be held next fall, at the time of holding the Mechanics' Fair. It is expected there

will be an Agricultural Fair also.) A fund will be raised for the purpose of awarding premiums for the best Vegetables, Fruits, and Flowers; and it is confidently expected that all who are engaged in this business, or feel an interest in the subject, will lend their aid, so as to make the exhibition highly interesting and useful. A list of articles for which premiums will be awarded, will be published in the Farmer as early as possible.

Premiums for Early Vegetables.

In order to induce gardeners to exercise their skill in producing fine early vegetables, so that our market may be earlier supplied with these luxuries, the following premiums will be awarded during the spring and summer:—

Table listing premiums for various vegetables like Asparagus, Radishes, Lettuce, Cucumbers, Melons, Tomatoes, Green Peas, String Beans, Green Corn, and New Potatoes, with prices per bunch or dozen.

The articles are to be delivered at the Rochester Seed Store, in the Arcade Hall, where they will be examined by the committee. All gardeners are at liberty to compete; but when two premiums are awarded for the same articles, they must be from different gardens. The size and quality, as well as earliness of the articles, will be taken into consideration. The names of the successful competitors will be published.

M. B. BATHAM, H. O'REILLY, T. M. WATSON, } Committee.

EATON'S BOTANY.

We have received a Prospectus from Professor Eaton, for a new edition of his Botany, which is to be ready early in the spring, and be comprised in about 550 pages, large octavo. We cannot do better than to give his Address to his former patrons without abridgment.

To Botanists and their Pupils, who have contributed to, and patronized, the Manual of Botany through the seven preceding Editions:—

Most of you remember, that the first spark of zeal for Botany, as an Academic study, was the incandescence, produced by legislative collision; when the question on the purchase of Dr. Hooker's garden was agitated in the New York legislative assembly. You will

also remember, that this treatise was well-timed: by coming out, when we had no substitute in English.—Bigelow's Boston Flora, and Muhlenburg's Catalogue were our only guides, until the learned work of Frederick Pursh appeared. This being in Latin, it did not check the progress of the Manual. Your united in its support, and carried it on by your liberal contributions, unto its seventh edition in 1836. For more than a year it has been out of the book market though loudly called for by you, and by those who have been dependant on your advice. The reason for so long withholding the 8th edition could be justified but it is not necessary.

I now solicit your renewed contributions for a very few weeks. Localities are so very important, that every addition you can make of a rare plant, will be a valuable contribution. But my time for receiving such favors is short. Mr. Gates, the publisher (I never will be a proprietor) has now sent me a proof-sheet, extending to page 120; and he gives me 48 pages per week. The work having grown beyond the fair size of Manual, I now entitle it, NORTH AMERICA BOTANY, and adopt the octavo form.

Age, and declining vision, have admonished me that I must call in the youthful zeal, with talented energies, to supply my loss by the wantings of years. I have been so fortunate, as to succeed in associating Dr. John Wright with me in this edition. He is a zealous and accurate young naturalist. After six years of ardent devotedness to the Natural Sciences this institution, he had the benefit of Professors Lyell and Silliman's instructions at Yale College. He is since been united with Professor Hall in a descriptive catalogue of Troy plants. In the summer of 1838, collected and reported, the plants of Michigan as official Botanist to the State Geological Commission.

Dr. Wright is going through all the generic and specified descriptions; correcting and modernizing language, as far as may be done, without departing from the original simplicity of manner peculiar to the work. New and well authenticated discoveries are also added by him. He has before him the works of Lindley, Torrey, Darlington, Hooker, Beck, &c. The contributions of many friends, in catalogues, letters, and rare plants, afford him many facilities.

I devote myself chiefly to the application of Lilliey's Natural Orders, New Medical Flora, &c., in order to give the student, in a cheap way, a greatly improved view of the properties and uses of North American plants.

Most respectfully, your obliged, TROY, Feb. 1st, 1840. AMOS EATON.

*The last four editions gave two thousand copies each.

Unfrequent Ploughing.

Under this head, in an agricultural Address by Nicholas of Belmont county, Ohio,—kindly furnished by the author—we find the following remarks:

UNFREQUENT PLOUGHING.—A doctrine formerly prevailed that it is the division of the particles of soil that causes fertility. This led to frequent ploughing as tending to produce this division. Fallows ploughed from three to four times. It operates to make the first crop better, but continually diminishes the strength of the soil. Philosophy, through the agricultural societies, came to the aid of the farmer, taught him that his great labor in ploughing was actually exhausting his soil, by exposing to the evaporating powers of the sun and wind, those particles which substitute fertility, and by all allowing the fertilizing gases to escape. The consequence is, the intelligent farmer now argues: If I can increase my crop one fourth as much by manuring as by a second and third ploughing, I had better manure than plough; for the first every year make my land rich and richer and thereby increase my crops, and the second will continually make it poorer. The frequent ploughing of the soil makes it an exhausting crop, but no means of averting it is yet known.

We should be glad to hear from some of our practical farmers on this subject, as well as to have further illustration of this theory from its respected author.

Silk Publications.

We omitted to mention in our last, "THE SILK CULTIVATOR," an excellent monthly paper, published at Wethersfield, Conn., by F. G. Comstock, Secy of the Hartford Co. Silk Society. Terms, \$1 per Annum. Subscriptions received at the Rochester Seed Store.

"THE SILK GROWER," formerly published at Burlington, N. J., is discontinued, and its subscribers transferred to the Journal of the Am. Silk Socy. The price of the Silk Grower was \$2 per year in advance of \$1, as stated in our last.

For the New Genesee Farmer.

Observations on the departing Winter.

It seems desirable that a small portion of the "Farmer" should be appropriated to subjects of interest, other than agricultural. If one page could even be filled with the most pertinent and valuable literary matter, it would probably be most welcome to a great majority of its readers. There are many things which have a pretty direct bearing upon farming interests, which are not strictly agricultural. The laws of weather, or the laws by which the changes of weather are directed, to advert to no other, are subjects of great consequence. Like all the other laws of this splendid system of nature, this wondrous and beautiful fabric of divine power and skill, they are to be ascertained only from observation. Facts are the elements upon which the general principles must be deduced.—The man who seems to know more about these changes, and to have the wisdom to anticipate them more than others, has been a more careful observer of facts, and taken a wider range of observation, and possessed a more happy talent of generalizing the principles, and forming special and important conclusions. Unavailable is the atmosphere, and hidden from the eyes of men as are the causes of changes, yet it was said with truth nearly two thousand years ago, "ye can discern the face of the sky." The same discernment is still to be acquired, and is to be the result of observation and deduction.

In the winter, which is now passing away from us, there has been a singular succession of facts. The changes of the weather have been great and attended with great consequences. The barometer has shown great differences in the weight of the atmosphere.—The winds have been uncommonly violent. Over a large tract of the Northern States there has been an unusual fall of snow. The ground froze in autumn before the rains had filled the earth with water to its usual extent, and yet there has been little want of its necessary of life and comfort.

The mean temperature of 1838 for December, was 29° 56, and for December 1839 was 28° 36, being considerably higher, from the first half of the month being uncommonly warm.

In 1838, the canal was closed by ice on November 1st, and remained closed through the winter. But in 1839, the canal closed on November 22, and was fully open in a fortnight and was not finally closed till Dec. 7. Hence it was that the mean temperature of the first half of December last was 34° 45. The last half had a mean temperature of 23° 33, a little above that of the whole of December 1838.

The mean temperature of January 1839 was 25° 31, and that of last January was 19° 54, a difference of nearly five degrees for the month. This is a great difference, and shows the severity of the last month.—The thermometer attests the correctness of the impressions of the public on this subject.

In December 1839, there fell about Rochester forty-nine inches of snow; in January 1840, about twenty-four inches. In the whole winter of 1838-9, there fell about 60 inches of snow, but it did not fall in such large quantities at a time.

The mean temperature of the first half of February 1839 was 20° 22, and of the present February was 7° 48, being warmer than the last year. Last year the sleighing lasted nearly through February, while it was gone this February as early as the 18th, and chiefly gone some days earlier.

The coldest weather in this city in 1839 was only four degrees below cypher; and this winter only three below. In the cold change, January 16 and 17, when our temperature was three below; at Albany it was from 28 to 32 below in different parts of the city; in Pittsfield, Mass., 32 below, and at New Lebanon and Baker Village, east of Albany still lower.

The winter has been much more severe on the east side of the Allegany ridge than on the west side.—Thus Virginia has had extreme cold over the lower country; the same also in New England and the eastern part of the State of New-York. In the county of Plymouth, Massachusetts, there has been little snow, and over the eastern part of the State of Ohio; but in the intervening distance, the snow has been deep, and the eastern part of this State and Massachusetts have been absolutely overwhelmed with it. Yet it is remarkable that on the west side of the Green Mountains in Vermont and in the northeastern parts of this State, there has been only a moderate fall of snow, and the winds that have been so tempestuous in other parts, have not reached that portion of our country.

More damage has been done by storms along our coast the past winter than usual; far more shipping lost, and far more lives destroyed. The breaking up of the ice and rise of the streams in the last fortnight, has made much desolation in several of the States.—From Ohio and the western part of Pennsylvania, from Virginia and Maryland, as well as from the Hudson and its tributaries, there are sad reports of great destruction of property.

In this section of our country, have we so far shared less in these sufferings. Even now the swollen Genesee is a roaring, dashing, and harmless, stream, is hastening to be lost in the blue waters of the Ontario.

Rochester, Feb. 25, 1840.

C. D.

Wild Rice, (*Zizania aquatica*.)

A subscriber writes "I would ask as a favor any information you or any of your subscribers can give through your paper respecting wild rice of the northern and western lakes and rivers, as I want some to sow in our flooded meadows and swamps, having reason to believe it may be cultivated on such lands to good advantage. I think the experiment well worth trying."

We have noticed the wild rice growing on one or two localities on the borders of lake Ontario, but not very abundantly. If an opportunity offers we will obtain some of the seed next summer, and send to our correspondent. From what we have seen, however, we should judge that it is decidedly a water plant, and cannot be cultivated except on such lands as are mostly covered with water.

We are not aware that any experiments have been made with a view to its cultivation, and if any of our correspondents can give us any information on the subject we shall be happy to hear from them. In the mean time we give the following extract from Loudon's Encyclopædia of Agriculture, the only work containing any thing on the subject, at this moment at hand: "*The Zizania aquatica* might be cultivated on the margins of ponds for its seeds, which much resemble those of Polish millet. It is exceedingly prolific, grows in great luxuriance, and produces abundance of bland, farinaceous seeds, in all the shallow streams of the dreary wilderness in north-west America, between the Canadian lakes and the hilly range which divides Canada from the country on the Northern Pacific ocean. Its seeds contribute essentially to the support of the wandering tribes of Indians, and feed immense flocks of wild swans, geese, and other water-fowl, which resort there for the purpose of breeding. Productive as is this excellent plant, and habituated to an ungenial climate, and to situations which refuse all culture, it is surprising, says Pinkerton [*Geog.* vol. III., 330,] that the European settlers in the more northern parts of America, have as yet taken no pains to culture and improve a vegetable production, which seems intended by nature to become at some future period, the bread corn of the North."

Duty on Silk.

The subject of imposing a protective duty on silk, for the purpose of encouraging its production and manufacture at home, is a question of great importance to this nation at the present time. Most journals have recommended that petitions be sent to Congress on the subject. But in the Dec. No. of the Silk Culturist

we find it asserted that Congress has not a right to impose any duty on French silks, (which constitute a large proportion of the manufactured silks imported into this country,) owing to a stipulation in a treaty made between France and the United States at the time of the settlement of the indemnity question, in which the latter guarantees to the former that no duties shall be imposed on her silks. We have made considerable search for some record of a treaty containing this stipulation, but have not been able to find any. And further, we are unwilling to believe that our government would shackle itself in such a manner, merely to "induce France, not to be generous, but just." Besides, in a late discussion of this subject in Congress, HENRY CLAY declared himself in favor of imposing a duty as large as the compromise act would allow, which is twenty per cent. And during all the debate, no allusion was made to the existence of any such stipulation with France as that mentioned above. We cannot but conclude therefore that the "Culturist" was mistaken.

From the Ohio Farmer.

Maple Sugar.

We publish, at the request of a correspondent, the following article on maple sugar, published in our third volume. As the sugar season is now approaching, it is to be hoped that many of our farmers will follow the simple process here described. The superior quality of the sugar will certainly justify every manufacturer in exercising neatness and cleanliness, where they involve no expense. And the higher price which this fine sugar will bring in market, will more than compensate for the diminution of weight arising from the drainage.

We think the method of drainage here recommended, by far superior to the usual method with barrels.—The conical shaped vessels are made of a cheap material, and no man can be found who is not sufficiently acquainted with carpenter's tools to make them for himself—besides these considerations, experience has fully shown us that small quantities of sugar are much more easily drained than large ones. These small vessels are readily handled, and can without difficulty or inconvenience be placed in a warm room, and the form of them is the best that can be adopted for the ready flow of the moisture.

MR. MEDARY—I send you a small specimen of beautiful Maple Sugar, manufactured by Mr. David Augustus, a very intelligent farmer residing in Tarryton, Fairfield county. When you are informed that this sugar derives its beauty from the particular cleanliness exercised by Mr. A. in its manufacture, I trust that with me you will wish that our sugar makers were in general better impressed with the propriety of attention in this particular. Is it not to be imagined, that in a pecuniary point of view they would be profitable? Mr. A. made, as I understand from himself, about 450 lbs., all of like quality with this specimen. The following description of the process of manufacture, is in his own words. It will be observed that he only varies from Chaptal in his language, and in the want of technical terms:

"Be particular to have clean buckets for the sap, and to have clean kettles. Boil only one barrel of sap to each kettle, and when boiled to a proper syrup to strain it through flannel, take it off the fire, and clear the kettles;—then pour in one pint of sweet milk to each barrel of water evaporated,—put it over the fire, and when it is about to commence boiling, take it off—let it stand a few minutes, skim it and strain it through flannel. It should not be suffered to stand off the fire more than one night, then put it over the fire, and for every three barrels of water, use at least four eggs well beaten—skim it, and if it is not perfectly clear, take it off, and strain it again—then boil it down with a rapid fire, adding, if necessary, clean butter or lard to prevent its boiling over; and when it is sufficiently boiled to lift from a cup of water with the point of a knife, take the kettle off to cool, and let the crystals form, for which purpose two days are amply sufficient. Then put it in the cones made of poplar boards holding from 15 to 20 pounds, bringing them to a point at the lower end, and leaving a hole at the point about the size of a shingle nail—set them in a stove room, or some other place where it may be made hot, so as to cause the molasses to separate from the crystals; leave it in the stove-room for a week, so that it may become perfectly dry."

I send you this description with the hope that the simplicity of it will induce others to make a trial.

I am yours, respectfully,

A. S. CHEW

Part of the Address of the Rev. D. V. McLean
before the American Silk Society.

DELIVERED IN THE HOUSE OF REPRESENTATIVES AT
WASHINGTON, DEC. 12, 1839.

The December No. of the Journal of the American Silk Society contains this able address. As we read it we could not help wishing that it might be read by every American citizen, especially every Farmer.—At the same time we feared that its length would deter many from its perusal, and also prevent our giving it a place in our columns. By the request of several of our friends, however, we have concluded to publish the most interesting and important portions of it, which we are satisfied our readers will find well worth an attentive perusal.

The Journal states that the "address was listened to with wrapt attention by a very large and respectable audience. The hall of the House of Representatives was crowded with ladies and gentlemen, and among the latter we observed Mr Clay, and many other members of Congress, all of whom appeared to be much pleased with the address. It is proper to say that the twelve pounds of raw silk produced by Mr. McLEAN, from a quarter of an acre of land, was on the table before the speaker, and gave great force to his arguments."

That our country is experiencing great and perplexing embarrassments, and that we are far from enjoying, as a nation, the plenty and the prosperity which our almost boundless resources lead us justly to expect, is painfully felt by all our citizens. We may blame our government or our banks, but whatever agency they may have in our difficulties, they do not *directly* produce them.

Such are our *real* or *imaginary* wants, that we *consume* more than we *produce*, and as long as this is the case, neither our government or our banks can furnish us effectual and permanent relief. Our imports have exceeded our exports; our consumption has gone beyond our production for years in an alarming degree. The commercial balance against us, *this very year*, will probably fall little short of \$50,000,000; added to which is the annual interest on state loans amounting to full \$12,000,000 more. That is, we are this moment in debt to the amount of upwards of \$50,000,000—besides a debt on time for somewhere near \$200,000,000, and this debt *must* be paid; our creditors are themselves embarrassed at home, and they must and will have their money. Here is the cause of the melancholy prostration of business in our whole country, the stoppage of banks, the ruin of merchants, and the downward tendency in the price of all the products of our soil. Look where we will no permanent relief can be found, but in the *actual production* of that which will liquidate our present debt, and the possession of which will diminish our importations in time to come—or serve as a valuable export in exchange for foreign products. But what can we produce that will promise these desired results?

After considering Wheat, Cotton, and Tobacco, and allowing conclusively that these articles will not answer the purpose, he proceeds:

These indeed form a respectable item in our annual exports, but they are utterly inadequate to accomplish the results desired, and neither can be materially increased to advantage. Where then shall we seek for relief? Is it answered, diminish our imports. True; but where shall we begin? What do we import now to any considerable extent that is not *absolutely* necessary to the *real* or *imaginary* wants of a great and rapidly growing nation? Will a prosperous people—with unlimited resources, submit to *real* or *imaginary* privations—because we read to them homilies on political economy. Is it not morally certain, that as our nation increases, our consumption must also increase, and our importations in a corresponding degree. The only hope of a diminution of imports, is home production. We *must* produce, for home consumption, some important articles, and in this way lessen importations, or we *must* produce something largely for export, that will balance our account current with other nations. Once more, I ask, where shall we turn for relief?—what shall we produce? Plainly, whatever it is; it ought to be something which we *largely consume*, which will command a *high and certain* market abroad, and which our *whole country* can produce. And what

article, I ask, is this? You anticipate my answer.—I fearlessly affirm, in my deliberate judgment, the production of silk alone, will meet the exigency of the case. *Silk must become a great national staple in America*, if we would secure and perpetuate individual and national prosperity. When this becomes the case—and, sir, I honestly fear not till then, under the smiles of a gracious Providence, and the benign influence of a paternal government, we may walk abroad with proud independence—secure from the vexations and embarrassments which, to a greater or less extent, invariably attend a debtor nation.

Here is an article which we largely consume, an article with which we *cannot* dispense, which the nation *must* and *will* have, either produced or imported in annually increasing quantities.

Next to food, the chief want of man, in every state of society, is clothing. This, in all civilized countries, is produced from *wool, flax, cotton, and silk*. The increasing extent to which silk enters into the clothing of the civilized world is amazing! In our own country it pervades every class of society, and enters largely into the *holy-day*, and even *daily* habiliments of 12,000,000 of people. The average annual importations of silk into the United States during the last five years, was \$13,273,114. In the year 1836, it rose to the enormous sum of between 25 and \$26,000,000. Now the *mere abstraction* of such an item from our indebtedness, would almost render us independent.

Here then *certainly* is an article which we largely consume at home, and which will command a ready market in any quantities abroad. But can we produce it? Why, I ask in reply, can we not? Nature has surely thrown no insurmountable obstacles in our way. We are nearly or quite on the same parallel of latitude with the principal silk growing countries in the world. The tree which furnishes food for the silk worm, we know will flourish here; because, in very many portions of our country it is of spontaneous growth. And even the more valuable kinds, which have of late years been introduced into our country, and which have been supposed incapable of enduring the rigors of our northern winters, are found by actual experiment, every thing their warmest friends could desire.

In the *actual production* of silk experiments have been made in every period of our colonial as well as national existence—which have uniformly resulted in the production of silk of as beautiful texture and lustre, and as strong a fibre as is produced in any country.—Especially have experiments been made during the last few years, from Maine to Florida, which triumphantly settles the practicability of producing silk in our country. There is something in the dryness and elasticity of our summers, which seem to adapt our country in a peculiar degree to the production of silk. We *can* produce it therefore, just as certainly as we can produce corn or wheat. But can we produce it to a profit? Are not the circumstances of our country such, and the nature of the business such, that the cost of production will equal, if not exceed, the value of the article produced? Here it must be confessed in the consideration which must be *decisive* on the whole subject, both in an individual and national point of view. Individuals will not embark in any kind of business, or having embarked, will not pursue it if it is found to be unprofitable. Nor can the introduction of any business benefit the nation, which does not benefit individuals. The great reason why it is thought it cannot be profitably produced in this country is the fact that labor is here so much higher than in any silk growing country on earth. How can we produce it as cheap as we can buy it when our labor, necessary to produce it, costs from *three to eight* times as much as the labor in silk growing countries.

There is much plausibility in this objection, I will acknowledge—and there was a time when it perplexed me greatly.

There are *facts*, however, on this subject, which it does seem to me triumphantly meet all objections to this business, drawn from the comparative price of labor; and I love to deal in facts.

Is it not a *fact* that manufactured cotton goods are furnished cheaper and better by England than by other parts of Europe? Are not the manufactured silks of England furnished *as good and as cheap*, if not *better and cheaper*, than the silks of other countries where labor is much lower.

I might instance the production of our finest linens. They are furnished *cheaper and better* by Holland and Belgium, than by other powers where labor is cheaper. France *can* and actually *does* furnish fine woollens cheaper and better than they can be furnished by Spain, although the price of labor is much in favor of Spain.

One great reason, undoubtedly, why the price of labor is neutralized, so to speak, is the fact, which the

history of the *whole world* will prove, that a *decided superiority* and skill is usually obtained in the production of a given article, by those with whom the price of labor is dearer than with their rivals.

We know the price of labor in any country, other things being equal, is usually according to the *skill and industry* of those who perform it.

We do not pay a mechanic or laborer a high price for his labor merely because he chooses to ask it, but because we know the product of his labor will furnish us that which we *know* we can sell to a good profit after paying him his wages. Suppose the daily wages of the East Indian is but a few cents per day, will this advantage counterbalance his want of skill and his destitution of the labor saving machinery, which pervade every branch of business in our own free and happy country?

The inventive genius of Americans is proverbial, and who can doubt the application of their skill and genius to the production of silk?

But again,—how can the price of labor operate to our disadvantage, when the silk growing countries of Europe generally, either owing to their negligence or climate, are in all cases obliged to make large deductions, for disease and death among their silk worms, while our attention, and the balmy nature of our climate render it unnecessary for us to make *any such* deduction. Some writers assert that even *fifty per cent.* is a reasonable allowance for the per centage which they lose. Should it, however, be but the quarter of this, *this consideration* alone more than balances the difference in the price of labor. If they can lose such a per centage, and still make a profit on their low priced labor, how much greater profit can we make, even if our labor is higher, when no loss is sustained?

But again, I ask how can the price of labor operate to our disadvantage when we are entirely free from every thing like excise duties on trees or silk? A burden which is borne heavily, indeed, by European silk growing countries. We have it on the best authority, that in the Neapolitan territory every mulberry tree pays to the government an annual tax of about sixteen cents, and every pound of silk about thirty three cents. Even the refuse and unprofitable part of the silk and cocoons pay about one per cent. to the government.

Surely if labor cost even *nothing* there, and it still profitable to produce silk, it may be vastly more profitable here with all the high price of our labor.

But if we can, as we actually do, grow and manufacture cotton and sell it in India cheaper than the can elsewhere procure it, why can we not do the same with silk?

We know with all their disadvantages other nations produce silk to a profit, and while in other things we yield to no nation on earth, why shall we in silk alone?

But we are not left to such a course of reasoning conclusive as it is, to my own mind, to prove that silk may be profitably produced in our own country. I do not believe we are warranted, as yet, from actual results—to speak with absolute certainty, as to the amount of profit per acre in the production of silk; still sufficient is known from actual experiments to satisfy a reasonable mind that it can be produced to a profit.*

Experiments have been made in various sections of our country during the last few years, expressly with a view to test the profits of this business; and feeling obliged as I do, to believe the statements of gentlemen who have made such experiments, my only surprise has been that the results have shown such *large* profit. I could name experiments made in Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, and Ohio; but they are familiar to all, and they all go to prove that silk can be produced so as to yield a *very large* profit.

But on this subject I have *other evidence still*, the silk can be produced in our country, notwithstanding the high price of labor, to a large profit—evident which, to me at least, is *perfect demonstration*, I have actually produced it myself to a large profit. Last year I actually produced silk at the rate of \$104 per acre. This year, valuing the raw silk at \$4.50 per lb., I produced at the rate of \$108 per acre; or valued it 2.6 per lb. at the rate of \$180 per acre. The gross product this year was 520 lbs. of cocoons, or 48 lbs. reeled silk. The cost of producing which is \$2.2 per lb., or the value of one male and two female hands twelve weeks each, which, valuing the silk as above, leaves the minimum profit \$108 per acre. Now I this I know there is no mistake. *There, sir, before you is the silk—it will speak for itself.* Nor was my knowledge or facilities and advantages greater than what is possessed by *any and every* member of the

ommunity; I am perfectly persuaded every prudent man may realize the same.

Now, in view of the foregoing reasoning and facts, an I doubt the practicability of our producing silk to profit, notwithstanding the high price of our labor; and can I, as a patriot, a philanthropist, refrain from urging my fellow-citizens to embark in this business?—and can any man who believes these facts, and this reasoning, fail to urge the same thing on his fellow-citizens, by his example, as well as by his precept.—*That demonstration* which results from the actual production of the article itself will convince.

It is not to be supposed that individual cases of failure and disappointment will not occur; some may undertake more than they can accomplish, and fail. Unfavorable circumstances may prevent success in others; the visionary and the grasping, who expect, at once, to miss a fortune in the production of silk, will be disappointed, and will, doubtless, abandon the whole thing. Those who engage in the business, however, intelligently with common sense views, will, with patience and perseverance, infallibly reap a rich reward, while they will assist in adding millions to the wealth of their country. What more then, I ask, is necessary to induce this whole nation to commence the production of silk.

I will advert to two or three considerations, which, in my own view, are of great importance in reference to this subject. The first is the employment which the production of silk will furnish to that portion of our community which are destitute of profitable employment. All the means of human enjoyment, and all the accumulations of wealth, are in one form or other the product of human labor. The happiness and wealth of nations are, therefore, promoted in exact proportion to the active industry of the community.—In order that readily extended prosperity exist, it is absolutely necessary that industry pervade every department of society, and that this industry should be directed to objects, adapted to those who labor, and capable of producing wealth. Then something is produced by all. No community, as a mass, can grow rich, no large number of families can permanently thrive, when one, two, three, or more members in each family are entirely unproductive. Suppose one quarter of the community, devote their energies to speculation, in its thousand forms. They may grow rich by their speculation, but all they gain is abstracted from others in some way, they produce nothing, their country must grow poorer—they must be sustained by the labors of the other portions of the community, and permanent prosperity cannot exist.

As nations and large communities are made up of families and individuals—in order to national prosperity it is absolutely necessary that industry pervade the domestic circle—that all the members of our families could be usefully employed. In the present state of society and the existing subjects of industry, however, profitable employment cannot be furnished to the whole of the domestic circle. In the days of our fathers there was indeed no want of such employment—the music of the spinning wheel, and the noise of the shuttle and the distaff was heard in all our dwellings. The numerous labor-saving machinery—the product of the art and preceding age—introduced into almost every department of business, has entirely superseded these a domestic life. The circumstances of a very large portion of our farmers are such, and the state of society is such, that there is now an absolute want of suitable and profitable employment for the female members of their families. They cannot, in consistency with their education and rank, take hold of the culinary department, and perform the drudgery of domestic duties. If there are many such in the family, even this would not furnish them employment: and the actual consequence is, that many an affectionate, prudent, and laborious father, has actually sunk beneath that dearly cherished but unproductive part of his barge. Every community, therefore, that would secure permanent prosperity, must seek employments in which they can profitably bestow domestic labor—and where, let me ask, is there an employment that promises so much, in this respect, as the production of silk? The production of silk seems almost designed for female hands—it is suited to their ability, and promises as large returns for the labor bestowed, as any other employment. In every period of the history of silk, it has actually received the fostering encouragement of female influence. Queens and noble ladies have been its patrons—and the noblest daughters of our land would be honored, by devoting a portion of their time to the production of silk in some of its stages. May we not hope that an article, which enters so largely into the wardrobes of our wives and our daughters—which, more than all other fabrics, adorns their persons—will receive their fostering care? In-

deed vast as may be the importance of the introduction of silk culture to our country, I despair of witnessing its complete success until our fair country women actually engage in its production. And one of the most cheering signs of the times is, that this to some extent is already the case. When your daughters and mine, sir, shall walk abroad in silks, which their own hands aided to produce, then the culture of silk, as a source of national wealth, will no longer be doubtful.

But there are other members of the domestic circle, besides those already referred to, whose labor is almost or entirely unproductive, for want of proper objects on which to bestow that labor. In almost every family, there are children and aged and infirm individuals, whose labor is of little value on the farm, and these are the persons who can almost entirely take care of the cocoonery. With a little direction and superintendence, even children can do much toward gathering the leaves and feeding the worm,—even the aged and decrepid, with the aid of ingenious contrivances for moving along by the shelves, can perform the work of the most athletic laborer.— Surely that community cannot but grow rich, when the labors of all are made productive. Other communities may be convulsed with every fluctuation in trade—this can smile with complacency in the midst of plenty—while all are debtors to them, they to none.

I know much mystery hangs around the whole subject of producing silk, in the midst of most of our farmers and planters. Accustomed to deal in the heavier products of the soil, the very delicacy of the article causes them to distrust their ability and skill in its production. They read or hear of large and expensive cocooneries, with nicely adjusted shelves, and hurdles and spinning frames, with furnaces and flues, with hygrometers, and thermometers, and serometers, and hourly feeding by day and by night—and they are actually frightened from the undertaking, or even from an honest and serious examination of its practicability. But these appendages do not belong to the subject. I can speak from at least some little practical experience—the production of silk in the farm of the cocoon, is an exceedingly simple thing. There is not a farmer or planter in our land, who has not sufficient accommodations, either in his house or his out-buildings, to produce from one hundred to one thousand dollars worth of silk, and no fixtures in most cases will be needed, but such as he himself, with his hammer and his saw, can furnish. Care and attention are indeed necessary; but these are equally necessary in order to the most successful results in any business. This is a business, concerning which experience alone can give us our best and most valuable information. Much, undoubtedly, may be learned from books, and the experience of others,—still we cannot hope for the most successful results until we have had some little experience.

The advocates of silk are far from wishing to see other products of our soil diminished. These may, and ought to be increased an hundred fold—but they do wish by their example and by their precept to add another to the existing list of our productions. They do wish to develop our resources, and add to our population an hundred fold; they do wish to retain in the possession of our own citizens the \$13,273,114 which we annually pay for foreign silk. They do wish to see productive industry pervade every department of life, and the condition and comforts of all our citizens improved. For ever dumb be the tongue that would represent our enterprize as inimical to the best interests of the poor. If ever an enterprize promised joy and prosperity to the whole community, especially to the poor, this is that enterprize. Is the immense production and manufacture of cotton no advantage to the poor? How then can the production of a rich and valuable article, the use of which pervades every class of society, which will give employment to thousands and tens of thousands of industrious poor, which will pour millions into our treasury—how can this fail to better the condition of the poor as well as the rich. Even if it should curtail the production of bread itself, which, however, it never will do, how could this operate to the injury or oppression of the poor? when the article produced will buy more bread than they could, by possibility, have produced from the soil?

Mr. President,—Time admonishes me, I owe an apology for trespassing so long on your patience, on this subject I scarcely know where to stop.

In know, sir, it is difficult to introduce to the extent of millions any new branch of industry among any class of men. It is not the work of a day. Patience and perseverance alone will accomplish it. But it is doubly difficult to introduce such a business as that which has called us together, generally among the farmers of our land.

Than farmers, there is no more valuable class of men in any community; cautious and distrustful as they are of innovations, they will, nevertheless, act on demonstration and conviction; and may I not hope, sir, we have demonstration in the beautiful specimens of silk here exhibited that will produce conviction and action.

Do I mistake the signs of the times, when I predict, as I here publicly do, the speedy and triumphant success of the silk culture in our beloved country. You and your associates, sir, may have opposition. A thousand fingers may point at you, and a thousand tongues may exclaim 'what do these feeble Jews.'— But wiser counsels will yet prevail in your halls of legislation. Then clannish will die, faint and fainter still will they grow, as year after year your bales of silk shall count by hundred and by thousands, until all the clamor of opposition is hushed to peace, and the voice of the croaker is heard no more.

O, sir, to my own mind the prospect before us is bright with promise. I look forward but a little, and my fondest anticipations are more than realized.— I behold this single product flowing to all our ports, through a thousand channels, and peace and plenty pervading all our borders, second only to cotton in the magnitude of its results.

An eminent senator, on a memorable occasion, promised all our farmers silken purses filled with gold shining through their meshes. But, alas, the worthy senator gave us nothing with which to procure either the purses or the gold, and no more would either come at his call, than the ghosts of Macbeth. But here, sir, is the silk to make the purses, and here is the gold, the returns of silk, to fill them.

Allowance of Water to Horses.

It is by no means an uncommon notion that if horses are to be got into condition for work, they should be allowed to drink but a very small quantity of water. On what physiological basis this opinion is founded, I confess appears to me a perfect mystery. Nevertheless, as many persons adopt this treatment, it is fitting to notice it. For my own part, I have ever found that it is an extremely bad plan to stint a horse in his water, and have consequently always made a practice of leaving plenty of it at all times within reach of every horse I have had. Of course I do not intend to say that when a horse comes in, heated from exercise, he should be suffered to drink, or should have a belly-full of water just prior to being ridden; but if a horse be watered *ad libitum* in the morning, he will not require to drink again for some hours, and should never be allowed to do so then unless perfectly cool. Those horses that are only supplied with a limited quantity of water at a time, and are never permitted to slake their thirst fully, will be much more liable to be griped, if at any time they by chance should drink their fill, than those who are always suffered to take as much as nature dictates to them: but should a horse have been hard worked and come into his stable very hot, I would, after having seen him well dried, only give him a small quantity, for two reasons; first, because his eagerness for water, may lead him to drink more at a time than is good for him; and, secondly, because a large quantity of water will probably cause him to break out into a cold sweat, in which he may remain all night if not looked to. After having taken a third or less, of a stable pailful of water, he should be kept without any for some time, and then be allowed to take what he pleases. When, however, you intend to stint your horses, do not sniffer your groom to offer them a pailful of water, and to take it from him when he has drunk a small portion of it, but let just the quantity you wish him to have, and no more, be given to him; he will then feel to a certain degree satisfied with what he gets, whereas by taking from him what he expects to have, he becomes fretful and discontented. In the first instance he makes up his mind to slake his thirst with a short allowance of water; whereas in the second his just expectations are balked in mid career, and his imagination cheated as it were in the height of his enjoyment—and there is much more in this than may be supposed. Physiologists are well aware of the connexion existing between the stomach and the brain; and those who have not enquired into this fact must either do so before they attempt to refute it, or take what I have said as proved.

"If youth were to come again," said an aged gentleman, "I would be a scholar." Ay: and how many more would be? What a useful hint this is to youth.

If every youth would keep in view the fact that "sixty minutes make an hour," how much wiser than the past would be the rising generation.

Time is the cradle of hope, and the grave of existence. It deprives beauty of her charms, while it transfers them to her picture.

For the New Geneesee Farmer

Female Readers--Farmer's Daughters.

MR. EDITOR.—As the object of your paper is to promote the interests of the Farming Community, permit me to direct your attention to a large class of that community, who, I think, have been too much overlooked by your predecessors, as well as by most other writers of the day. I allude to the female portion of the agricultural population; particularly to *Farmer's Daughters*: of whom I am proud to call myself one. I am aware Mr. Editor, that you will probably think I am about to introduce a subject which is not exactly adapted to your columns; but sir, I hope to show that it is not only adapted to them, but that your paper of all others is the most proper medium through which to discuss the subject.

I have been a reader of the Geneesee Farmer for several years past, and have often imagined that its editors did not expect it to be read by any persons except our fathers. But from my personal knowledge I am convinced that it is read as much by the female members of families as by the other portion. And as it has a more general circulation than any other periodical in this section, it is capable of exerting a wider influence on this community than any other paper. I can assure you that your paper is not thrown aside or destroyed like common political trash; it contains so much instructive and interesting matter in relation to our daily avocations and the scenes which we witness around us, that it is carefully read by the whole family and preserved for future reference. Thus you see that it exerts an influence, not only on the minds of the sturdy farmers themselves, but on their whole families. The sentiments and instructions which it contains will affect the character, and the happiness of the rising generation; and therefore it is that I wish to engage a portion of your attention in favor of that class to which I belong, and which I am fully convinced have much need of such influence. Had I time and space I think I could plainly show that *Farmer's Daughters* may be greatly benefited by means of your paper; and also that it would be within the proper sphere of such a journal to devote a portion of its columns to their use, in such a manner as will lead them more properly to understand their privileges and advantages, and to appreciate, improve, and enjoy the numerous means of happiness by which they are surrounded.

If it meets your approbation, Mr. Editor, I will hereafter endeavor to point out a remedy for some of the difficulties which exist in country life, and show that we possess great advantages and the means of true enjoyment within the reach of all. I am aware that this is a task which I am poorly qualified to perform, and therefore hope that some abler pen than mine will ere long be induced to enlist in this cause.

Very respectfully yours,
ANNETTE.

Maple Grove, Feb. 14, 1840.

P. S. I was encouraged to write the above letter to you Mr. Editor, by reading an article in your last paper which led me to infer that, (though not likely to remain such long,) you are at present a Bachelor and disposed to favor the Ladies. If it was a mistaken inference I shall not expect to see any notice taken of my communication. A

REMARKS.—It is with much pleasure that we add to our list of correspondents the signature of Annette, and we are highly gratified to learn that our paper is so much read by females, especially by farmer's daughters. When we consider the immense influence, which, as wives and mothers they are soon destined to exert, not only over the character and happiness of farmers and the advancement of agriculture, but over the destiny and prosperity of our country; we are constrained to admit that their improvement is an object of the

highest importance, and deserving more special attention than most writers have bestowed upon it. As far as is consistent with the character of our journal, we will gladly afford some space for such communications as are calculated to promote the interests of our female readers. And as their improvement is intimately connected with subjects relating to agriculture and horticulture, we have no doubt that much good may be accomplished.

The above epistle from ANNETTE, was addressed to our junior editor, and her *postscript* would have received a private answer had he known exactly the *who and whereabouts* of the fair writer. As it is he would say that Annette is nearly right in her conjectures respecting him; but he does not intend to change his condition until he has had an opportunity to become better acquainted with some *Farmer's Daughters*.—*Ed'rs New Geneesee Farmer.*

“*Line* as manure for wheat,” “*Descriptive list* of Beans,” and a number of communications are omitted for want of room. They will appear next month.

ARNOLD'S IMPROVED PORTABLE HORSE POWER.

THE Patentee of this machine, intended to have furnished to the readers of the “*New Geneesee Farmer*” this month, with some important facts relative to his recent improvement in his *Horse Power*: showing that all the difficulties or objections which the experience of one year has discovered, are entirely removed, and that he is now prepared to challenge any person to find a fault in it that is worthy of notice, or to produce a *Horse Power Machine* that can compare with it in point of utility. But for the want of room the article must be deferred until next month. In its present state of perfection it would seem that nothing is wanting to make it the most desirable and most useful *Horse Power* in the country. They are now made for one or two horses, and sufficient power is obtained for all ordinary purposes with only one horse.
W. C. A.

Rochester, Feb. 27, 1840.

IMPROVED BERKSHIRE AND CHINA PIGS.

THE subscriber will have on hand for sale in the month of May next, and during the summer season, pigs of the above breeds, of perfect purity of blood and from the largest sized and best stock in the country.

A new imported Boar, direct from Berkshire county England, was added to the pigery last Fall and stock of his get will be ready for delivery from the first of July. This boar possesses all the requisite fine points of a good hog, and has great length for his age. He was descended from large parents, and said by his shipper to be totally unrelated to any thing yet sent out to America. His color is nearly black, and all other characteristics like the best of the old strain originally imported by Mr. Hawes. His stock is recommended for a fresh cross to those already possessing Berkshires. The subscriber has also of the get of Mr. Lossing's importation in the Fall of 1837.

Price, per pair, of Berkshires, caged and delivered on board steamboat, \$20.00
Price, per pair, of Chinas, 15.00

All tasks, after shipping, with the purchasers.
When something of a number are taken and it is desired, they will be delivered at Portsmouth on the Ohio river, or any intermediate point on the Ohio Canal, 10 to 12 weeks old, for \$30 to \$35 per pair, free of all other charge. Money must be remitted with the order for stock, or it will not be attended to. Those first remitting will take precedence in point of time. Bill at par at this place, or nearly so, will be expedient. Address, *post paid*,
A. B. ALLEN,
Feb. 1, 1840. Buffalo, Erie county, New-York.

Gilson's Straw Cutters and Root Slicers.

FOR CUTS AND DESCRIPTIONS, SEE PAGE 25, N. G. FARMER.

THESE MACHINES are now manufactured by the Subscriber at his machine shop, near the east end of the Aqueduct, Rochester, where a supply will be kept for sale, and also at the Rochester Seed Store. Farmers are respectfully invited to examine these machines before purchasing others, as it is confidently believed that they are superior to any other machine of the kind now in use.

The price of the Straw Cutter is \$20
Of the Root Slicer, 11
JOSEPH BALL.

Rochester, Feb. 1840.

BUFFALO NURSERY.

LARGE ADDITIONS are constantly being made to this establishment, and it now embraces a large collection of choice varieties of the Apple, Pear, Plum, Peach, Cherry, Apricot, Quince, Almond, Grape, Currant, Gooseberry, Raspberry, Strawberry, &c. Also, a fine collection of Ornamental Trees and Shrubs, Vines, Creepers, Bullous Roots, Herbaceous Perennial Flowering Plants; 100 kinds of the most hardy Roses; 15 kinds of Peonies; 75 kinds of the most splendid double Dahlias. Also, a large collection of choice Green House Plants, in fine order. A few thousand Marigolds, Mollucanas, at low prices.

The location of this Nursery is well adapted to supply Western orders; as the numerous Steam Boats on the lakes enable the proprietor to ship all packages direct to port without delay. Printed catalogues forwarded gratis to any persons on receiving their address. Orders will receive prompt attention.
B. HODGE.
Buffalo, Feb. 1st, 1840.

PURE CLOVER SEED.

BOTH the large and the medium kinds of Red Clover Seed, true to its name, and free from injurious weeds, may be had at the Rochester Seed Store. This seed was raised by well known respectable farmers, and may be relied on.
M. B. BATEHAM.

March 2, 1840.

SPRING GRAIN.

SUBERIAN Bald Spring Wheat; Spring Rye; English Potatoe Oats,—and true Chevalier Barley, for sale at the Seed Store.
M. B. BATEHAM.

GENUINE ROMAN POTATOES.

THESE celebrate potatoes are for sale at the Rochester Seed-Store, at the following low prices:—\$2 per bushel—\$5 per barrel, (21-2 bushels.)

As the price will undoubtedly advance in the spring, those who wish to obtain them will do well to order them soon.—They will be safely kept till spring, if desired, and sent according to order.
M. B. BATEHAM.

January, 1, 1840.

Agents for the Rochester Seed Store.

A full assortment of seeds, put up at the Rochester Seed Store, may be found at each of the following places. Subscriptions will also be received there for the “*New Geneesee Farmer and Gardener's Journal*!”

Remarks.—We are sorry to say that it appears by the *H* news from England, that the demand for flour from that country is not as great as was anticipated; and consequently the price in the Atlantic cities has somewhat declined. This has checked for a time the anticipated advance in our market, and prevented any improvement in our report.

Provisions of some kind have advanced a little, and some kinds of produce bring a fair price; but still business in general is quite dull, and people still complain sorely of its times. The banks have got in the greater part of their collection, and are afraid to let it out. So that our suffering is not owing to any scarcity of the necessities of life! I am not want of circulating medium with which to transact business. It is needless to say, that we believe it impossible for this state of things to last long; the inventive and elastic powers of this people will soon devise a remedy; and the energy and enterprise will carry it into effect.

Our Success.

Our most sincere acknowledgements are due to Agents, Post Masters, and the friends of Agriculture generally, for the kind and efficient aid which we have received during the past month. It is with great pleasure we inform them that we received, during the month of March, very nearly two thousand subscribers. And although many more will be required, in order to defray the expenses of the present year, enough has been done to convince the most sceptical, that this paper can and will be sustained, notwithstanding some opposition, and the pressure of the times. Let the friends of the cause continue to exert themselves a little longer, as they have thus far, (which we are confident they will do,) and we will soon show that the Genesee country is not on the retrograde, but is still able to sustain the cheapest and one of the best agricultural papers in the Union.

Be Particular.

We again have to caution our friends not to send letters addressed to the "Editor of the Genesee Farmer" (without attaching the word *New*), as they are claimed by Mr. Tucker or his agent, and we do not receive them. We have lost a number of remittances in this way, and Mr. T. being now absent, we have been unable, as yet, to recover them, although informed of the circumstances.

Address papers, "New Genesee Farmer," and letters to BATEHAM & MARSHALL.

A few EXTRA COPIES of this paper are distributed on account of the advertisements and other matters which it contains. Any persons who may receive it, who are not subscribers, need not consider themselves urged to subscribe if not disposed to do so. Any subscribers who may receive an extra copy, are requested to give it circulation.

¶ The friends of the Genesee Farmer are particularly requested to read the article on page 57.

The Public Press.

We feel under much obligation to many Editors for the favorable manner in which they have noticed our effort, and their liberality in offering us exchanges. The price of our paper is so small, compared with most of theirs, that we do not ask, or expect them to exchange with us; but we will send our paper to all who will notice or advertise it, mentioning the character, terms, and agents, and send us one paper, marked. Agents for the Rochester Seed Store, and all Post Masters are agents for the "Farmer."

All Agricultural Papers are requested to exchange with us, and may draw for any difference in value.

¶ Will the AMERICAN FARMER (and others) please give credit to the *New Genesee Farmer* for whatever it extracts from our pages, and not to the "Genesee Farmer." And will the YANKEE FARMER please inform its readers where it found the article in its No. 12, headed "Rohan Potatoes in Wheatland," and signed R. HARMON? It looks very much like something that we have read before somewhere, and we guess the Yankee did not mean to call it original.

Agents For the New Genesee Farmer.

It does not appear to be understood by all of our friends, that Post Masters generally are authorized to act as Agents for this paper, and most of them very kindly consent to do so. Consequently our readers who feel disposed to aid us, and do their neighbors a favor, have only to hand their names, with the money, to the Post Master, and request him to forward them to us.

Persons residing near the towns mentioned on our last page, can make payments to, and get the back numbers of the Seed Store Agents.

Hints for the Month.

At the opening of this month the farmer should prepare to drive his business energetically—to take time by the forelock, and to keep well ahead of his work. The success of some crops greatly depends on their being early put in, and well put in.

There are many places, on heavy soils, where large patches of wheat have been winter-killed; let these patches be sown with *spring wheat*, and this vacant ground will not be lost.

Take early measures to cart out all the manure which has been collected during winter, to be applied to corn and root crops. A farmer might as well throw away his pocket-book, as to leave manure wasting by fermentation, when it can be applied with so much advantage.

As good crops depend much on ploughing well, and getting ground in good order, hasty and superficial ploughing should always be avoided, and thorough work only performed. In ploughing ground already broken, instead of attempting to cut slices a foot or eighteen inches wide, they should be only six or eight inches. Let the farmer try this mode, and the appearance of the work will convince him of its advantage.

Plaster operates to the greatest advantage by being sown early.

Meadows should be early and carefully shut up, and all animals excluded from them. New ones should be cleared of stone, and rolled.

Draining, on hard soils, where not too wet, may be done much more easily and cheaply in spring, than in autumn when the soil has become hard and dry.

Young fruit trees that stand in grass ground, should have the earth spaded two or three feet around them, and kept clear from grass and weeds during summer.

Peach trees should be examined at the roots, for the worm, which eats and remains in the bark; its presence is generally indicated by the oozing gum at the surface of the ground.

Plant ornamental trees and shrubs whenever opportunity permits—a farmer, who attends only to making

money, and not to the appearance of his dwelling, neglects an important comfort of life.

Let strict accounts be kept of the farming operations for every day in the year, and of every field on the farm, that the profit and expenses of each crop may be known.

Agriculture in Upper Canada.

Notwithstanding the numerous disadvantages under which the farmers of Upper Canada have labored for several years past, we perceive that there is still a most praiseworthy spirit of improvement existing there.—The numerous scientific English and Scotch agriculturists who reside in that rich province, are too intelligent and fond of reading, to remain uninformed respecting the improvements of the age; and too enterprising and public spirited, not to carry them into practice, as soon as the means are brought within their reach. A number of efficient Agricultural Societies exist in the province, and appear to be conducted with much ability and usefulness. Many very superior domestic animals have been imported, and improved implements, seeds, &c., are annually introduced.

Above all, we are happy to see that agricultural papers are receiving an increased patronage in Upper Canada. The *New Genesee Farmer*, owing to its low price and perfect adaptedness to the climate, soil and system of farming, is fast gaining circulation, both among individual farmers and societies. We hope soon to find some valuable correspondents among our Canadian friends; and we would suggest to the officers of Agricultural Societies, the expediency of making this paper the organ of their communications, with which they can most readily promote the interests of Agriculture in Upper Canada. Our terms to companies are so extremely low, that a mere trifling sum would place the paper in the hands of each member; and if a large number are taken, we will send the packages by steamboats, during navigation, if desired, so as to avoid postage; and we will also devote a portion of our columns to the more particular interests of Canadian readers. We hope this subject will receive prompt consideration; so that if desired, we may furnish them all with the back numbers.

The following notice, copied from the Cobourg Star, is a good illustration of the spirit which is manifested by the people of Upper Canada. Let this spirit of improvement be cultivated and increased, as it easily may be, till it pervades the whole farming community, and the character of that naturally fine country, will soon attain an eminence, which will surprise those ill-informed minds who imagine Canada to be a cold, unfruitful region; and who suppose that its farmers are behind the age in agriculture. It is true they may make less noise, and appear to move more slowly in the march of improvements; but it will be found in the long run, that their progress was more sure, and their success more permanent, than that of many of those who think they are making the most rapid advancements.

"We understand that at a committee meeting of the Northumberland Agricultural Society, held at Graton last Wednesday, it was resolved to import a large quantity of *Plaster of Paris*, to be sold at cost and charge, to members of the society; and also a quantity of the celebrated *Rohan Potatoes*, to be distributed among them gratuitously. No member, however, is to be entitled to avail himself of either of these advantages, unless he shall have become so, and paid his annual subscription of one dollar to the Treasurer, previous to the first day of April next. We hope that our farmers will profit by this information. *Grass Fair*, for cattle, all sorts of live stock, manufactures, &c., we would remind our readers, will take place on Wednesday, the 15th day of April."

Farmers' Meeting.

Just as this paper was going to press, we had an interview with Mr. T. Weddle and one or two others, who were desirous that a call should immediately be published for a meeting of farmers and the friends of Agriculture, to take into consideration the subject of forming an Agricultural society in this county, and discussing any other matters of interest to the farming community. The time and place were not agreed on before our paper went to press. If it is decided to have the meeting before next month, notice thereof will be given in the Rochester News on 15.

Lime as Manure for Wheat.

Our correspondent "SENeca" in our second No., inquires for the best method of testing the presence and quantity of lime in soils, and whether the use of lime on what are termed limestone soils, is beneficial.

It is much to be regretted that accurate and systematic experiments have not been made to a greater extent in this country on the use of lime; but that it is greatly beneficial to many of our soils, has been sufficiently proved, and none appear to doubt. Experiments have especially proved its value in the culture of wheat.

In order to ascertain the presence of lime, (carbonate of lime), let a handful of the soil be put into a glass containing water sufficient to cover it; stirring it until it is entirely freed from atmospheric air, and removing what vegetable fibres and scum may appear upon the surface. Then pour in a quarter or half an ounce of muriatic acid, which, by its greater specific gravity, will sink and mix with the soil. If any lime be present it will immediately combine with the muriatic acid, and effervescence will follow from the escape of the carbonic acid. This method will indicate a very minute proportion of carbonate of lime, as, according to Ruffin, "the gas that only eight grains of calcareous earth would throw out, would be equal in bulk to a gill measure. Indeed, the product of only a single grain of calcareous earth, would be abundantly plain to the eye of the careful operator, though it might be the whole amount of gas from two thousand grains of soil." If no effervescence whatever is visible, we may be certain that the soil does not contain the smallest portion of carbonate of lime.

To ascertain the precise quantity of lime, when present, one of the best methods is by means of the pneumatic apparatus of chemists, which measures the quantity of carbonic acid gas liberated; the quantity which two grains of the carbonate of lime will yield, being equal in bulk to one ounce of water. Its proportion in the soil can hence be readily calculated. It is to be observed, however, that in this experiment, the soil must be thoroughly dried before the operation, otherwise, in weighing it, the presence of water would cause inaccuracy and spoil the result. Care must also be taken that a sufficient quantity of muriatic acid is added, and that it acts thoroughly on all parts of the soil.

The second inquiry of our correspondent is, "Does all land in limestone countries contain as much lime as is advantageous, and what experiments have been made to ascertain the effects of applying lime as manure, on limestone, or other lands of our country?" We believe that Edmund Ruffin, author of the essay on calcareous manures, was the first in this country to prove that many fertile soils; those in the immediate vicinity of limestone rocks, were entirely destitute of carbonate of lime. In Cayuga county, soil from the most fertile fields, when taken near the surface, gave little or no indication of its presence, although in the immediate vicinity of immense beds of limestone, fragments of which were scattered over the ground.—Such soils have consequently been greatly improved by its application. Very productive soil in Wayne county has yielded the same results, although in both instances, the subsoil indicated, by its effervescence with acid, a considerable portion of lime.

Experiments in the improvement of such soils by lime, have been very limited, but they have sufficiently proved its beneficial effects. We hope, in a future number, to notice these experiments more at length; and, in the mean time would earnestly recommend all farmers in Western New York, with whom it may be practicable, to make accurate experiments on this subject, measuring the results, the communication of which to the public would doubtless be of essential benefit. There is probably little, if any, land in the

western part of the state which would not be much improved by its proper application. We believe that *shell-marl*, equally efficacious with lime, (and which is, in fact, nearly pure carbonate of lime,) may yet be found in many places in great abundance, in the northern portions of Western New York;—it occurs in immense beds under the Cayuga marshes, and has been found in many swamps, as, for instance, in Junius, Seneca county; in Macedon, Wayne; and Farmington, Ontario. Its presence may be easily ascertained by thrusting a sharp pole through the peat of the swamp several feet downwards, and if mail be present it will cover the lower part of the pole, and is readily distinguished by its whiteness, by the numerous small shells it usually contains, and by its powerful effervescence in acids.

We close our remarks on this subject for the present, by the queries proposed by the English Agricultural Society, which we copy from the first volume of the Journal of the society, published last year, with the request that if any of our readers or correspondents can now, or in future, answer any of them from experiment, they will give us the results.

1. How many years have you used lime as a manure?
2. How many acres have you limed each year?
3. What quantity have you put on per acre?
4. On what sort of soil?
5. At what time of year?
6. For what crop?
7. Whether with or without manure?
8. In what manner applied?
9. What effect on the crop?
10. What effect on the succeeding crop?
11. What was the price of the lime?
12. Do you continue to use it?
13. What is the chemical description of the lime you use?
14. State generally any particulars with respect to lime.

Destroying Couch Grass.

The following method of destroying *couch*, *quitch*, or *witch grass* (*Triticum repens*), if effectual in thoroughly eradicating this obstinate intruder, will be of great value, as it is becoming abundant in some parts of the state, our fertile lands being doubtless favorable to its increase. The method which has formerly been practised, was by frequent ploughings in hot, dry weather, and harrowing between each ploughing, that the roots might be all worked to the surface. Sir John Sinclair says, "It is one of the greatest banes that husbandry has to contend with;" and, "is so interwoven in the soil, when land has been long under tillage, as to form a perfect netting." London, in his Encyclopedia of Plants, also says, "It is one of the worst weeds in arable lands and gardens; and in the former it is only to be destroyed by fallowing or fallow crops, or *laying down to grass*; and the latter by hand picking or very deep trenching."

Quitch Grass.—Mr. EBRON—Some of your correspondents have been striving to rid themselves and their neighbors of that troublesome weed, quitch grass. Now, I happen to know, from experience, one of the easiest and most profitable methods of destroying this grass. This grass will never increase in pastures. It always finds its way into such land as has a warm light soil, and is most cultivated. Land abundant in this weed should be immediately converted to a sheep pasture, and in a few years it will be entirely eradicated.

My father once took a piece which was thickly set with it, ploughed it late in June, sowed it with winter rye, and turned it into his sheep pasture.

The rye continued to come up for a year or two and was kept closely fed by the sheep, and in a few years the quitch grass was exchanged for sweet clover and red top. I doubt not but that this plan might be adopted to advantage on many farms that are overrun with this useless weed. It is folly to talk of digging it up when it has obtained a firm foothold. Land that is of a light thin soil can be changed from tillage to pasturing to great advantage. Pastures would be improved in this way, for it is bad economy to possess a pasture that will give only now and then a spot that cattle will touch.

Another method I have seen practised in ridding small garden spots of this grass, which is by laying boards over the ground for a season. This is much easier than to dig it up. While on this point I cannot help noticing one fault among gardeners. They are very anxious to prevent the weeds from going to seed during the first part of the season, but as soon as the plants get a little start, they suffer the weeds to take their own course. Consequently there is a fresh supply of seed for the succeeding spring.

If some of your correspondents will counsel me killing thistles with as little labor and as much profit I advised them in killing quitch grass, they will receive my sincere thanks.—*Farmer's Register*.

For the New Genesee Farmer

Profits on Sheep, &c.

MESSES. EBRONS—It was with much pleasure that I placed my name on your list of subscribers;—determined, as I was, to have an agricultural paper, I subscribed for the Cultivator before your prospectus arrived. It was not known here, till then, that there would be a new Genesee Farmer, but one and of the old subscribers have enrolled their names for New, though many had ordered the Cultivator. Success to your undertaking, gentlemen, is my most cordial wish—such a paper as yours is much needed in this part of the state, and I hope that every farmer in the Genesee country will not only become a subscriber, but a reader also.

As I have noticed invitations given to farmers furnish results of their observations, I would give some statements relative to a flock of sheep which I have the management of for a few years. They were reared from a flock of ten coarse ragged sheep, purchased in 1831. This flock was crossed with the best blood within reach, up to the present time. It now contains forty-six; and for weight of carcass and fleece, is surpassed by any in our neighborhood. The following will show the profits of this flock for the past year:

For 10 fat wethers at \$3 per head,.....	\$30
" 11 coarse yearlings and lambs, \$1.25.....	13
" wool sold at 37½ cents,.....	17
" 120 lbs wool at 40 cents,.....	48
" 2 wethers slaughtered, worth \$3 per head,.....	6

\$114

Besides the above, there still remains the original number of *forty-six*, of as much real value as were last season. I lost but one lamb last year. There are no ticks among the flock; I follow them too closely with tobacco, which I apply, by steeping in water to the lambs a few days after shearing; for then they will have left the old sheep and have fled to the lamb for better protection among their thick coat of wool. A very little care in this way will often save a great deal of wool, besides making it easier to winter the flock.

Enclosed is a sample of silk, manufactured this season. The worms were fed from the leaves of white mulberry. We fed but a few hundred, but enough to obtain some knowledge of the business. We intend to engage in it to some extent hereafter. I have no doubt it will prove lucrative.

Will any one who is acquainted with raising grapes among the readers of the Farmer, give information through its columns, of the best mode of cultivating, pruning, &c., and the soil best adapted to it, that may bear soon? I have some choice varieties of large purple, but know nothing in particular of their culture.

Pike, Feb. 14, 1840.

For the New Genesee Farmer

Experiments with Potatoes for 1840.

MESSES. EBRONS—Many experiments have been made with a view of ascertaining the best and most economical method of cutting and planting seed potatoes; but still I do not think the subject is fully understood. For instance, it is not generally known how large a quantity of seed can be advantageously used when potatoes are very cheap; nor how the

then they are very dear. I would therefore suggest that potatoes are very cheap this year, it would be well for farmers to try various experiments on this subject. Let them prepare a good even piece of ground, and mark out the rows equally with a given number of hills, then plant each row with a different quantity of seed, or with seed cut in a different manner; for instance,

- No. 1. Put one whole potatoe in each hill.
- No. 2. Put two whole potatoes in each hill.
- No. 3. Cut the potatoes into two, three, or four parts, and put four pieces in a hill.
- No. 4. Put one, two, or three of the same pieces in hill.
- No. 5. Cut off the seed ends and put one piece in hill.
- No. 6. The same, with two or more in a hill.
- No. 7. Cut out single eyes and put two in a hill.
- No. 8. The same, with three or four in a hill, &c.

In this manner a large patch might be planted, each in a different manner. The number of the rows and the manner of planting each, should be set down in a memorandum book. Then let them be well cultivated, and not allowed to be disturbed until harvest, when each row should be carefully dug and measured, and the result given to the public, mentioning the number and distance of the hills. Care should be taken to have all the seed potatoes of one kind, and of a uniform size; and if the weight of the seed put in each row could be given, it would make the experiment more complete.

SAMUEL STROWGER.

Penfield, Feb. 10th, 1840.

For the New Genesee Farmer.

MESSRS. EDITORS—The 1st. and 2d. Nos. of the New Genesee Farmer came to hand this evening. I had passed away some two or three hours very agreeably, in reading the views and opinions of others in relation to the different branches of farming, when the thought occurred to me that I might contribute my "mite" to the pages of your new paper, which, by the way, I am confident will attain as high a reputation, as regards talent and usefulness, as did its predecessor.

Rearing Calves.

For a beginning, I shall be under the necessity of taking an exception to the opinion of "W. S. T.," in relation to "skim milk calves." He says, on page 19, "a calf will live through the summer on skim milk, but as soon as cold weather comes, he will begin to fail, and ten chances to one whether he will survive the winter." It is a very poor plan, in my estimation, to try to bring up calves on skim milk. They will never look half as nice as those brought up on sweet milk, or those that suck the cows, nor make half so good cattle at three years old."

Now, if what "W. S. T." lays down for fact, be true, there is not a farmer in our section of country, who understands or consults his own interest. All our calves are what your correspondent would call "skim milk calves;" but I believe they pretty generally survive the winter," and when "three years old," are more than "half as good cattle" as his "sweet milk" calves, or those that have "sucked the cows."

The farmer who keeps cows and rears calves, takes into consideration (or at least ought to) the profit to be derived from them. Making butter and cheese, if rightly managed, is profitable business. But if the calves are fed on new milk, or suck the cows, the making of butter and cheese must be postponed at least three months, say four. Well, what then? His calves are three or four months old, as the case may be, and look fine—yes, stately and handsome. But that is a long road that never turns. Here the calves are taken from the cows, or, as the saying is, "weaned," and are turned out to graze. They have now to get

their living another way. A change of diet takes place, and a change in the looks of the calves is soon discoverable. The fall arrives, they begin to lose their nice and stately looks; that beautiful symmetry given by a good coat of flesh, gradually disappears; winter now sets in, and the calves that have swallowed so much of the nutritious beverage, milk, are in none too good condition for its pinching cold.

Now for the other side of the case, to wit, "skim milk calves." They are to be taken from the cows when about one week old. The milk, for the first and second week, should stand 12 hours. It is then skimmed and scalded. After it has cooled to the temperature of milk from the cow, a handful of canell* is to be added to each calf's mess, which at first should be five or six quarts. This quantity is to be increased as the calf grows older, as judgment will direct. Whey, with shorts or canell added, may be given, after ten or twelve weeks, with good success. Calves, reared in this way, soon forget their dams, become docile and manageable, and continue gradually to improve, without any checks or pull-backs; will winter equally as well, and be in as good condition the following spring as those reared according to the directions of "W. S. T." But there is an item yet to be added to the "skim milk calf." The butter or cheese amounts to something. And, in order to be correct, we will allow "W. S. T." a surplus of one-third to add to his; then we shall have the remaining two-thirds. We will now suppose the butter or cheese to be worth six shillings per week, and the time fifteen weeks. "W. S. T." will have thirty shillings and we shall have sixty shillings, which will leave thirty shillings in our favor, and this we shall add to the value of our "skim milk calf."

As it respects shelters for calves, and in fact all other stock, I agree in full with "W. S. T." I am abundantly satisfied that they are not only a great saving of fodder, but have a very great tendency to keep the bones or frames of stock, of all kinds, well coated with that very indispensable article, flesh. I also agree with him, that farmers are apt to keep too much stock, and consequently they are not sheltered and taken care of in the most profitable manner. The farmer who manages judiciously, will take into consideration the quantity of fodder, or keep, he has on hand, or, at least, intends to have; then calculate the amount of stock this will keep in good condition through the winter. He will reserve enough of the smaller ears of his corn to feed his calves regularly once or twice each day, in order to keep their flesh up, and avoid the disagreeable task of raising them up by the tail every time they lie down to rest their weary and feeble limbs. His shoats will be supplied with a good comfortable place to lie in; they will be well fed and kindly treated, when he will have the satisfaction of knowing, that this animal, if rightly taken care of, is not so much of a hog as his appellation generally seems to indicate.—And, in fact, all his stock will be provided with shelters, and well fed. Should all farmers thus manage, we should not see so many "pitiable sights," as complained of by "W. S. T." Instead of long-haired, raw-boned horses and cattle, lank, lean-looking, squealing hogs, and "sheep with their fleeces almost torn off, others, as the old saying is, 'about ready to kick the bucket,'" we should have the sleek and prancing steed, the well-proportioned and handsome ox; a good-looking, decent hog; and well-clad and healthy sheep. Happiness and comfort would be dispensed to all the farmer's stock, and he would experience his share in knowing himself to be the dispenser of their comfort. CULTOR.

*A kind of fine mill feed or middling.

Cayuga Co., Feb. 21st., 1840.

A Large Green House.—The London Horticultural Society are building a Green House, which covers one acre of ground; frame work, iron: cost, \$100,000.

For the New Genesee Farmer.

Management of Fruit Trees.

Preparing the ground for planting.—The first requisite to procure a good orchard is to select a dry piece of land. A sandy loam is preferable, but any land will answer if it is sufficiently dry. The land should be manured, ploughed at least to the depth of one foot, and planted with some hoed crop the year previous to setting the trees. Potatoes are preferable, as they leave the ground well pulverized.

Trimming the top in transplanting.—Trees when first set should be very cautiously trimmed, and all or nearly all the top should be left the first season. I know that in this particular I differ from the commonly received opinion. But I have learned by sad experience, that cutting off and mutilating the tops at the time of transplanting, retards their growth at least one half, for the first five years. I shall here adduce some reasons why I think it a bad practice, setting aside my experience on the subject. The leaves of trees and vegetables are the lungs, through which the sap is elaborated and converted into vegetable fibre. This process "consists in the decomposition of carbonic acid gas, is either brought to the leaves by the sap, or absorbed directly by the atmosphere. The substance of all plants is mostly carbon; and as carbon in its common state, however minutely divided, is mostly taken up by the sap of plants, this most essential ingredient is obtained in the form of carbonic acid gas, from which the oxygen is separated by the leaves under the action of light, leaving the carbon ready for assimilation or conversion into vegetable fibre." From this statement, it will be seen that the leaves and roots act mutually; the one is as necessary as the other to promote the growth of the tree, and without this concert of action the sap would ascend and descend without adding any thing to the tree; and when the sap returns without being elaborated in the leaves the roots cease to grow, or at least grow very little the first season.

Washing the trunk.—Trees should be washed annually with soft soap, and well rubbed with a woollen cloth. This is the best preparation that I ever tried to destroy lice and give a healthy appearance to the trees.

Orchards should be well ploughed and planted to some hoed crop for four or five years. A. W. B. & Eric co., 1840.

For the New Genesee Farmer.

Culture of the Bush Cranberry.

(*Viburnum oxycoccus.*)

MESSRS. EDITORS—It is probably not generally known, that every garden may, with little trouble or expense, be supplied with this valuable fruit. The high bush cranberry is found in many parts of Allegany and Cattaraugus counties, and may, with great ease, be transferred from its native forest to the yard or garden. Indeed, I know of no shrub that bears transplanting equal to this, and have never seen it placed on any soil, wet or dry, sand or clay, where it did not flourish. The shrub so much resembles the snow ball as to be distinguished from it with great difficulty. A friend of mine once took great pains to procure a fine large snow-ball from an old garden, and was much surprised, in the next season, with a fine supply of cranberries. The fruit is not at all inferior in flavor to the cranberry of the swamps, and can be distinguished from it only by a small pit, which, for some uses, makes the swamp cranberry preferable. The fruit grows in large clusters, and will remain on the bush during the winter, and is of a beautiful crimson color. I do not know how extensively this fruit is cultivated in this part of the country; but I never saw it until I came to Allegany. Should you think this shrub unknown to any of your readers, you might confer a favor by publishing this.

YOUNG & CO., ALLEGANY FARMER.

Anglicco, Allegany Co., Feb., 1840.

The New Genesee Farmer was Honorably Commenced.

The following letter we received from Dr. A. W. Smith, of Lockport, who is well known as one of the earliest friends of the Genesee Farmer, and was a frequent contributor to its pages. We had an interview with him a few days since, and learned that, in common with some of his neighbors, he had got an impression that the New Genesee Farmer was commenced in an unfair and dishonorable manner, and therefore was unworthy of their support. We related to him briefly the facts in the case, and he soon became convinced that there was nothing wrong in the matter on our part, but on the contrary, the New Genesee Farmer was honorably established and ought to be well sustained.

We informed Dr. S. that we intended to publish a short statement, in order to overcome the erroneous impressions which we find exist in the minds of many of the farming community. This he thought was necessary and proper, but he was fearful that it would cause unkind feelings and remarks, where it was desirable that mutual good will should exist. The latter will explain itself, and the statement which follows it, we hope will satisfy the minds of all those who still feel any doubt on the subject.

To the Editors of the New Genesee Farmer—

"Let there be no strife, I pray thee, between me and thee, and between my herdmen and thy herdmen—*for we be brethren.*" That they were brethren, was, by the patriarch Abraham, deemed a sufficient reason why there should be no *strife* between himself and Lot, or their herdmen.

When the former conductor of the Genesee Farmer proposed breaking up the establishment at Rochester, and going to Albany, and there unite its destinies with the "Cultivator," I freely confess I viewed the movement with regret. Perhaps local attachments and prejudices, had somewhat to do with my regrets. This was natural. From early infancy I have been a resident of the Genesee country—have mingled with its inhabitants under the various circumstances connected with the settlement of a new country—have, with them, known and felt the stings of adversity—with them have rejoiced in our common prosperity—with them I have crossed the Genesee River when not a bridge spanned its waters—and have traversed the long Ridge road when scarcely a house enlivened the sad solitude through which it passed.—With them I have seen this *then* wilderness and solitary place blossom as the rose—a city rise from the wild wastes of nature as if by enchantment, on the lovely borders of the Genesee—and with delight, bordering on rapture, have listened to the sound of the "church going bells," mingling with the voice of its many waters, where once we heard the sullen plunge of the solitary flood, enlivened only by the scream of the eagle and the yell of the savage.

It was natural, therefore, that any indications of falling off or retrograding, should be viewed by a person, thus circumstanced, with feelings of regret. I was conscious that the Genesee Farmer had done much to promote these wonderful improvements; and the past as well as the future reputation of the Genesee country, was essentially dependent on the continuance and character of its agricultural journal. With these feelings, I could not but regret the determination of Luther Tucker to remove the Genesee Farmer from the land of its *name* and *nativity*, and to merge it into another, some hundreds of miles distant. I schooled my feelings into submission, however, and became reconciled to the "union"—nay, more, I became a subscriber and advocate of the "Cultivator," and even felt an honest opposition to your "New Genesee Farmer."

This feeling, however, arose mostly from a belief that something like *unfairness* had been resorted to by those concerned in getting up the new paper.—This view was strengthened in my mind by complaints which I frequently heard from others: so that on receiving a prospectus from its originators with a request to lend them my aid, I, too hastily, determined to have nothing to do with it, not even to read it.—I was led to suppose that it would have but a brief existence, and would serve only to injure the cause of agriculture. But in this, as in many other things, I have been mistaken; and I am now happily convinced that both papers may be eminently useful and well sustained. While the one embraces more of science and

scientific subjects, suited to the taste of the more educated and scientific portion of the agricultural community, and to "gentlemen farmers;" the other may be no less useful to another and more numerous class, equally deserving of attention, and more needing such assistance!—I allude to the *practical*, working, every day farmers. Not but that many of these would understand and profit by scientific research as well as the others; but that from the mere force of circumstances, they have less of leisure to attend to the details connected with scientific experiments, however much they might desire it. Another important consideration in these times, is the price—50 cents a year.—This certainly places it within the reach of all. One cent a week saved from tobacco or some other useless or hurtful indulgence, will cover the whole expense. I have no fault to find with the price of the Cultivator—it is richly worth its cost, and, for one, I will hereafter have them both—so say some of my most intelligent neighbors. Let every farmer take *one* of them, and *both* will be amply sustained, and the country immensely benefited.

L. W. S.
Lockport, March 20th, 1819.

M. B. Hatcham's Statement.

The commencing of the New Genesee Farmer, was a matter almost exclusively of my own managing; and if there is any blame connected with the affair, I am the one on whom it should rest; and consequently I am the proper person to give any explanation concerning it which may be required.

In order that my *conduct* may be rightly judged, it is necessary that my *motives* should be understood and appreciated; and to do this, it is necessary to look at the circumstances in which I was placed. For five years, I and a partner, had been proprietors of the Rochester Seed Store, and during that time had always been on the most friendly terms with Mr. Tucker. The Genesee Farmer and the Seed Store were both calculated to promote one object, and assisted each other. We considered the influence of that paper indispensable to the success of our business; and with that influence in our favor, we found it increasing and improving each successive season.

Rather more than a year ago, my partner desired to remove from town; and I purchased his interest in the concern, and took the entire control of the Seed Store. Last Spring, I found a still greater increase of the business; and saw plainly that it was necessary for me to make larger arrangements for obtaining supplies from abroad. I was determined to make the establishment commensurate with the wants of the community; and observing the increasing and beneficial influence of the Genesee Farmer, I was fully convinced that my arrangements for obtaining supplies were inadequate to the demand which would exist this and succeeding years. Accordingly I resolved on going to Europe; and after collecting in all the resources at command, I embarked; and spent several months, and a number of thousand dollars, in travelling, obtaining information, forming acquaintances and business arrangements in England and Scotland, and purchasing a very large supply of such seeds as I supposed would be wanted here this spring. I returned to New York in the fall, and there procured an additional supply of American seeds, so as to be sure to have my stock complete and adequate to all demands. Thus I invested, not only a large amount of money, but credit also, for the purpose of extending my business so as to meet the increasing wants of the farming community. It may be judged then, with what feelings of disappointment and regret I learned, on arriving at Albany, that the Genesee Farmer, on which my business so much depended, and on which I had so confidently relied, was to be discontinued, and my friend Luther Tucker was to remove to Albany. At first, I could hardly believe the report. On my arrival home, I remonstrated with Mr. T. and endeavored to dissuade him from the arrangement. But he thought it would be for his interest to go, and it was too late to re-consider the matter. I told him he must not expect that this place would long be without such a paper, as some person would doubtless commence one, if he gave it up; and the paper being almost indispensable to the success of my business, I should of course assist it if commenced, although I had enough business on hand already, and did not want to undertake the publication myself.

A day or two after this, to my surprise I was shown a prospectus for a "Genesee Farmer, New Series," headed by J. E. Force and N. Goodsell. The former I had seen in Mr. Tucker's office, but knew nothing of his character or abilities. The latter was one whom I had good reason to believe would use all his influence to break down my establishment, in order to build up one of his own. (I have since learned that

he had ordered a supply of seeds from a distance, pledging that he was going to edit the Genesee Farmer, and open a seed store in this place.) I therefore saw at once that if this project succeeded, it would decidedly injure me, if not to the public. I went to see Mr. Tucker in relation to it. He complained greatly of Force's conduct in getting out a prospectus, and said he should caution the public against it as an *imposition*—which he accordingly did, as is well known.

After Mr. Tucker had issued his "caution," Mr. Force came to me, and asked if I would like to engage in the project with him, either as part proprietor or as a compensation; to which I replied, in view of what Mr. Tucker had said, I did not consider that he had acted altogether honorably in the matter, and therefore I would have nothing to do with it, but would advise him to abandon it. He replied, that Mr. Tucker had misrepresented the affair and had injured him and he would not give it up, as he could get sufficient help *without* my assistance; and further, that he had already engaged an office, ordered type, &c.

A few days after this, I informed Mr. Tucker what had passed between me and Force. He appeared very indignant on the subject, and said he *should* have complained if any respectable person had commenced a new paper in an open and honorable manner, but this affair was an *imposition upon the public*, and he considered it his duty to do all he could to oppose it. I explained to him fully my situation, and then told him that some of my friends had advised me to commence a paper; and I felt much inclined to sue a new prospectus, in order to defeat the other. He said he had no objection to that, as I had a *perfect right to do so, if I chose*; tho' he was confident that would soon regret it; and he did not believe I could make the paper sustain itself.

I was now fully convinced that I must either take this matter into my own hands, or suffer my business and my credit to be greatly injured. I therefore, after consulting my friends on the subject, came to the conclusion that duty to myself, my friends and the community, *required* that I should engage in the enterprise, provided I saw any prospect of success. My friends of agriculture with whom I conversed, felt convinced that the project of J. E. Force was unworthy of confidence—would doubtless end in failure, and prove an injury to the cause it professed to advocate.

I consulted J. J. Thomas and some others, and found that there would be no great difficulty in obtaining Editorial aid and correspondence. In the meantime Mr. Force had been endeavoring to engage help, but did not appear to succeed. He again applied to me; I told him I could not assist him, but if he would *give up his project entirely*, I would see what I could do. This he declined, in the belief that he could still succeed; but, learning that I and E. F. Marshall had terminated to issue a new prospectus, he came and offered to abandon his effort, if we would agree to the expenses of his prospectus and give him a gratuity to mail our papers. This I refused to do, he left me. I then learned that he was beginning to receive considerable money from subscribers in that place where he had sent his prospectus. It is of course desirable that they should not be disappointed; and as we wished to get the matter out of our hands, I proposed to him, that if he would hand over to us all the subscriptions which he might receive from his prospectus, we would pay the balance due him for engraving, and for printing it; and we would give him the job of mailing our papers at such a compensation as we thought it was worth, or such as others were willing to do it for. He finally agreed to this proposition, and a contract was signed accordingly.

I have been thus particular in explaining the arrangement with Mr. Force, because it embraces principal charge which is brought against us. We have been accused of buying out his unjust project and forming a secret arrangement with him, by which he should be interested in the new paper. To this reply, that *we never gave nor agreed to give him a dollar*, except what he should earn by faithful labor; *he has no interest whatever in the New Genesee Farmer.*

It has been further intimated, that Mr. Force took from Mr. Tucker's office a copy of his list of agents or subscribers, and that it has been used to promote circulation of our paper. We have only to say, if we do not believe that he took any such list, and are sure that no such thing has been used in any way to benefit the New Genesee Farmer. Our papers have only been sent to Post Masters, and such friends of the cause as we happened to know.

Another ground of complaint is, the *name* of the paper. But this also appears to us unreasonable. We admit that the name *Genesee Farmer* of right belonged to Mr. Tucker, so long as he chose to continue

Farmer in the Genesee country. But as the title is strictly local, and confined to a certain territory, he could not justly claim an exclusive right to it, if he had removed some hundreds of miles from that locality. In order that we might not appear to build upon the reputation of his labors, however, we concluded to change the title sufficiently to convince all who should see the paper, that it was something new and different from what had heretofore been. We thereupon adopted the title "New Genesee Farmer," as being the most, if not the only appropriate one we could devise.

But there is still another objection brought against the title, which, although hardly deserving a reply, we find of considerable weight with some. It is intimated that there was some promise or agreement with the conductors of the Cultivator, that there should not be another paper established here. It is very probable that Mr. Tucker made such a promise on his part, but that any other persons did, we think he will not pretend. It is true, I told him that I should not aid in the project of Force and Goodsell; and I believe J. J. Thomas said he would not assist any effort of the kind, as he was convinced that it was honorably conducted. This is the substance of all the promises which have been made on the subject, by those concerned in the New Genesee Farmer.

But I find that I am occupying too much valuable space, and cannot reply to all the petty insinuations which are thrown out against us. I hope that enough has been said to satisfy the minds of all, and set this matter forever at rest. Still, if any of our friends desire further explanation, I will freely give it, as there is nothing concerning it which I am unwilling to publish if necessary. With regard to Mr. Tucker, I have long esteemed him as a friend and fellow laborer, and I deeply regret that a separation of interests should ever separate of feelings between us; especially while both are engaged in the same honorable calling. I am aware that any thing which conflicts with the interests is apt to affect his temper, and therefore although I have thought that Mr. Tucker was doing injustice, I am still anxious to lay aside all animosity and adopt the motto borrowed by our friend Dr. South: "Let there be no strife, I pray thee, between us and thee—for we are brethren."

M. B. BATEHAM.

Letter from Niagara--Hints for the Times.

Editors New Genesee Farmer:

GENTLEMEN—I have received the first three numbers of your paper, and have perused them, for the most part, with much satisfaction. Be assured, gentlemen, the effort you are making to re-establish an agricultural paper in Western New York, receives the unqualified approbation of the great portion of the friends of a predecessor. I most sincerely wish you success. You fail to obtain that patronage necessary to the carrying of your efforts, I hope and believe the reason may be any other, than that they should be unworthy of being sustained. And besides, the thoughts of farmers who are yet unsupplied with any agricultural paper, and who would be greatly benefitted by a supply, could one tenth part of them be induced to subscribe for the New Genesee Farmer, it would afford you a very liberal patronage.

But the hard times," says one; "the unparalleled hard times," says another; "I cannot afford the expense of an agricultural paper," says Mr. W., and Mr. X. says, "we raise so much produce already that the market is overstocked, and we cannot sell it."

Now this may all be true, and that a part of it is, there is no question. Hard times—money scarce—produce low, &c., &c. Well, what of all that?—Will we neglect our farms, because the productions thereof bring but low prices? Should we not rather endeavor to increase the quantity? If I wish to raise one hundred dollars from the produce of a certain quantity of land, if the price of produce is low, this deficiency of price must be supplied with an increased number of bushels. My neighbor N. planted, in 1838, 100 acres of potatoes, for market. He obtained 400 bushels, and sold them at 50 cents per bushel. The next year he plants the same number of acres, and obtained 800 bushels, but can sell them at only 25 cents per bushel. Still he is receiving the same amount of money

from the two acres of land as he did when the price was 50 cents. Not only so; but shall we not consider the great advantages to the consumer? The poor laborer when he was obliged to pay 50 cents per bushel for potatoes, \$8 per barrel for flour, \$8 per hundred for pork, &c. &c., found very hard times. But now, when these articles can be obtained for half those prices, the producer complains of hard times.

But I am not quite certain that the evil in this case is because we raise too much produce. There are undoubtedly other causes which have produced the present stagnation of business. We have too much, both at home and abroad. The balance of trade is against us. The general want of confidence—suspension of specie payments at the south, and a combination of circumstances, have produced the present state of the market.

But farmers should be the last to complain. An unprecedented course of prosperity has attended our labors for the last five or six years; and now, when we have an overflowing abundance; and, forsooth, because others have a tolerable supply also, we complain! Oh ingratitude! And moreover, complaining will never remove the evil. We must begin at the root of the disease. We must learn, as did our fathers in that great struggle to establish our national independence, to become, in fact and truth, independent of foreign nations.

Are your readers aware that all the wheat, corn, flour, meal, beef, pork, lard, butter, cheese, timber, and, indeed, every other article exported from the United States, (except cotton and tobacco,) will not, by several millions of dollars, pay for the silk goods which we import for our own use? And this foreign debt against us, although it is at present enormous, is constantly increasing, and probably will continue to increase, until the people, by refusing to purchase foreign goods, apply the remedy; or until it is applied by our national legislature, by the establishment of such a tariff, as shall prevent their introduction, and thus protect our own manufactures.

But enough of this: I have wandered from my subject. When I sat down to write you, I intended to have made the subject of mixed husbandry my principal topic; but I have wandered so much that it is hardly worth while to embark in that subject on this occasion. I will only add this request, to wit: just enquire of your readers whether they have got a good lot of ruta baga turnips, or mangel wurtzel, for their sheep during the month of April? Do their cows fare well? How are the pigs? Are the calves kept in a warm stable, well littered? Are the ploughs, harrows, hoes, forks, roller, chains, &c., all in good order? Is the wood for the coming season (not forgetting the oven wood) fitted for the convenience of the cooks? If so, very well. Yours truly,

Lockport, March 27, 1840. NIAGARA.

For the New Genesee Farmer.

Fictitious Signatures--Agricultural Society.

MESSENGERS EDITORS—I wish to make a suggestion to your correspondents, respecting the propriety of affixing their real names and places of residence to their communications for the New Genesee Farmer.

The writers for such a paper, engaged in similar pursuits, and laboring for the same cause, naturally feel a peculiar regard for each other; and it is very satisfactory to know each others names and places of abode, even though we may never have the pleasure of seeing them. We feel like familiar old friends, and we read each others remarks with a degree of real pleasure, which we cannot feel when the writer hides himself behind some fictitious cognomen.

But there are other reasons why writers should not only give their names and places of residence, but also mention the nature of the soil they cultivate. Our country embraces so great a variety of soil and climate,

that, without this information, when a writer gives us an account of his success in cultivating any crop, we cannot tell whether his practice is adapted to our circumstances or not, and the principal value of his communication is lost.

A farmer, located on the rich alluvial soil of Ohio, or even this state, will adopt a very different practice, and different views of agriculture, from one located on dry Oak openings; and both will differ essentially from him who cultivates the ordinary loamy soil of this region.

The communication of X. Y., in your second number, was worthy of the writer's name. I fully agree with him respecting the necessity of forming an Agricultural Society in this county, and believe the sooner it is commenced the better. The extreme scarcity of money will deter many from co-operating at present, who imagine that money is the main thing required; but I believe it can succeed, and if my name, with a reasonable contribution, can assist in the matter, it is at your service.

R. HARMON, JR.

Wheatland, Monroe co., N. Y., March 1840.

Remarks.—We like the suggestion of our esteemed correspondent respecting signatures; and we hope our friends will duly consider the subject. At the same time we can fully appreciate the motives of many writers in choosing "fictitious cognomens." We do not insist on it, but we greatly prefer that our correspondents should give their names and places of residence in full—especially when writing on practical agriculture, or giving an account of crops, &c.

In relation to the Agricultural Society, we apprehend that friend Harmon, in common with many others, has got a mistaken impression respecting our wishes on this subject. We do not care so much about names or money, (although these are somewhat necessary,) but we want to see some action on the subject.—Let farmers take the matter into their own hands, and organize a society, and conduct it their own way for their own benefit. A little effort on the part of such men as Gen. R. Harmon, Jr., would do more to set this thing agoing than all we can say or do in its favor. We only consider ourselves the servants of the farmers in this matter, and hold ourselves in readiness to obey their orders. Our paper is only a medium through which they can communicate with each other. At the same time we are willing and anxious to do all we can consistently to promote the object in contemplation.—Eds. New Gen. Far.

The Past Fall and Winter in England.

The following is the postscript to a letter which we received from a friend near London, dated Feb. 10th, 1840.

"We have had a good season in this country, for the four or five months past—almost incessant rains, with the exception of about 11 days of frost, in January.—Much of the wheat intended to have been sown could not be got in, and much that was sown, has been injured or destroyed by the wet. Gardeners' and Seed Growers' work is much retarded. Floods have been very frequent, and done great damage in some parts.

This is the day of the Queen's Marriage, and all is bustle and confusion in London. Several persons have been killed in the crowds, although it rained most freely (as usual)."

We copy from the Toronto Patriot the following extract from a letter, written by Dr. Thomas Rolph, and dated London, Feb. 18th.

"Will you say to all the farmers you know, that the wet season in England, not only prevented the wheat from being sown in the fall in many parts of the United Kingdom, but that the long continuance of it has proved exceedingly destructive to that which has been sown; and the weather is still so unpropitious, that ploughing cannot be proceeded with; the lands are saturated with water, and the rain still falls. The Farmers in Upper Canada, I think, should sow as much spring wheat as possible, as it will be in great demand."

Lucerne, or French Clover.

A correspondent asks for information respecting *Lucerne*, particularly whether any experiments have been made with it in this section of country. We wish some of our friends would give us information on this subject; in the mean time the following selections afford the best answer we can give our friend at present.

"I have read with great interest the letter of Mr. John Lowell, in the Monthly Genesee Farmer of November last, and quite concur with him in his opinion of the value of *Lucerne*. My impression is that two or three acres of it used for soiling Cattle, would add one-third to the produce of a farm of one hundred acres, both from the greater number of Cattle that could be kept on the farm, and the larger quantity of manure that could in consequence be made, so that its good effects would be seen in all the crops. I beg to offer you the result of my experience in cultivating it here.

The very rapid growth of weeds in this country is a very great difficulty in the way of the cultivation of *Lucerne*; so much so, that I have found it impossible to grow it in drills, as the practice is in England. I sowed three quarters of an acre of it in drills in 1831; in 1835 it cost me \$53 to weed the crop, yet in 1837 half of it was already choked by the growth of grass, clover, and other herbs. Part of it too was killed in hollows where the water lodged in winter. Seeing the culture by drills so unsuccessful, I sowed some *Lucerne* seed broadcast and thickly, in a square plot of sandy loam, in my garden, on the 19th of July, 1836. In two months after it was sown I pulled out a root, which then measured 30 inches from the top of the leaves to the point of the root. In 1837, it was cut on the 9th of June, and on the 9th of every subsequent month to October, growing in each month about 18 inches. It was cut also five times in 1838, and if the spring had not been so cold, I think it would have been fit to cut by the middle of May, as it began to sprout in April, but was choked by the cold; the temperature having decreased in the latter half of the month of April. The conclusions which my experience seems to afford, are the following: 1st. That *Lucerne* should be thickly sown, (Mr. John Lowell says 20 lbs. to an acre.) upon sand or sandy loam, with slopes sufficient to carry off water, and without hollows in which water can lodge. 2d. That in order to prevent grass and weeds creeping into the *Lucerne*, there should be a border round it of 5, 6, or more yards in width, in which should be grown every year, mangel wurtzel, potatoes, or other roots which require the soil to be well weeded.

Lucerne would be best, preceded the previous year by a crop of potatoes to prepare the land, and as it needs not be sown till the end of May or early in June, the land might be ploughed once or twice previous to the sowing.

Lucerne will grow vigorously on pure sand; for a gentleman who has recently resided at Dunkirk in France, tells me he was surprised to see its great growth on the pure sands adjoining that town.

I have known *Lucerne* to continue to grow for sixteen years in England.

Genesee Farmer.

The following Dialogue is from the pen of the author who furnished those published in our previous numbers. We take it from the "Cabinet of Agricultural Knowledge."

We are happy to announce that the author of those interesting dialogues is about to publish them in book form, revised and enlarged. The book will be a valuable one in every Farmer's family.—*Farmers' Cabinet*.

Dialogue between a Father and Son—Lucerne.

Frank.—Father, you said you would tell me more about the Island of Jersey—since then, I have seen an account of the growth and produce of *Lucerne*—a crop which you say grows there—which is truly astonishing. I find that it yields four crops for hay during the summer, and after that, abundance of feed for cows and sheep. Is it a species of meadow grass or clover?

Father.—It is much like a narrow leaved clover, but the blossom is very unlike, being of a beautiful blue color. The growth and produce is, as you say, truly astonishing; and having had repeated opportunity to make myself acquainted with the crop in every stage of its growth, from its cultivation, I am able to speak very decidedly to its great superiority over every other, provided the soil be suitable, and the culture well attended to. The crops to which I allude were so re-

markably productive, and I had such constant access to them, that I was induced every evening to enter into a journal, whatever had transpired during the day, worthy of observation; but for this circumstance, it would be out of my power, at this distance of time, to speak so decidedly as to their rapid growth and large yield: I have now, however, an opportunity to quote *chapter and verse* from this journal, which I will do, for your information.

The Rev. Mr. P. having a field of an acre and a quarter, which had been suffered to run to weeds and burr-shes, determined to clean it, and seed it with *Lucerne*: he had it there fore trenched with the spade, to the depth of the staple of the land, which was in some places very shallow, the substratum being a hard gravel. By this operation, the richest part, or surface soil, was turned down on the gravel, and the subsoil was brought to the surface, to be enriched by future dressings. The work was done for fifty cents per perch, of twenty-two feet square, and the seed was sown broadcast and harrowed in by hand. On the appearance of the plants, they were not supposed thick enough to form a crop, but by careful management the field has produced numerous crops, both of green food and hay. The journal commences with

FIELD NO. I.

September 13th. Mr. P's field of *Lucerne*, measuring one acre and a quarter, after soiling two horses and a cow during the whole of the summer, has already given three crops of hay, on that part of the field which has not been cut for soiling, to the estimated quantity of five tons. The fourth crop, now growing, measures two feet in height.

Sept. 21st. The fourth crop of *Lucerne* mown this day for hay.

Sept. 24th. The hay carried in in excellent condition: the weather having been dry and hot, the only preparation requisite was, to turn the crop once; this crop is equal to any of the preceding cuttings.

Sept. 26th. A portion of the field from whence gravel had been dug, and the part levelled, has always dried up after producing one crop of hay in the summer, the substratum being impenetrable: that spot has this day been covered to the depth of five inches with fresh earth, preparatory to trenching and re-sowing.

Oct. 18th. The trenching of the gravelly spot has been delayed, but the shoots of the *Lucerne* have penetrated the earth through a space of five inches, and it is now determined to allow it to remain untrenched.

Nov. 23d. A fifth crop will not come to sufficient maturity for hay, but there is excellent food for horses and cattle.

April 8th. The gravelly spot is the best and earliest part of the field; scarcely an inch in space, without a vigorous shoot of *Lucerne*.

May 6th. Commenced mowing the crop of *Lucerne* for soiling, a remarkably heavy crop, more than two feet in height.

11th. The first crop mown for hay this day. A space six feet square, taken as a fair average of the field, yielded twenty-three pounds in weight as soon as cut; after one day's exposure it had lost eight pounds in weight, showing that a gallon of water had evaporated in twenty-four hours from this small quantity of green food.

23d. The hay carried in good condition—not injured by five rainy days, the crop lying light, by means of its large stalks, requiring only careful turning now and then.

June 26th. A second crop mown for hay, measuring two feet eight inches in height. The weather has been remarkably hot and dry, the result has been, a growth in the crop of two inches in height every twenty-four hours, the last four days.

July 17th. The third crop of *Lucerne* measures seventeen inches in height; the weather is extremely hot and dry, all the meadows are parched, and farmers are compelled to feed their cattle on hay; the *Lucerne* grows away as though it had a shower every night.

22d. The crop on the gravelly side has again failed; a first and second crop come earlier and grows more vigorous on this part of the field than on any other; but after that, it suffers from a want of depth of soil, affording a familiar illustration of the parable of the sower, (Math. xii. 5th and 6th verses.) The seed which fell on stony ground immediately sprang up because it had not much depth of earth, and consequently soon felt the influence of the sun, but when the sun was in full vigor, it was parched, and for want of nourishment, withered away.

Aug. 7th. The third crop of *Lucerne*, mown this day for hay; a very heavy crop, many of the plants in blossom. From the first to the second mowing, one

*Twelve tons eight hundred and fifty lbs. per acre.

month and fifteen days; from the second to the third cutting, one month and eleven days; and after this the field was rented to a tenant for £30 sterling per annum.

FIELD NO. II.

Sept 5th. A piece of land was sown this day with *Lucerne* seed of this summer's growth, unaccompanied with any crop.

March 20th. The *Lucerne* sown on the 5th of last September, with seed of that summer's growth, has stood the severity of the winter, and the crop measures six inches in height this day.

May 4th. Cut the first crop of *Lucerne* this day two feet in height.

June 14th. A second crop mown this day, equal to the first.

July 14th. The third crop mown this day, twenty six inches in height.

August 24th. The fourth crop was mown this day equal to any of the preceding.

Sept. 5th. It was on this day last year, that this crop was sown with seed of that summer's production the fifth crop from which measures a foot in height this day.

FIELD NO. III.

Major T. sowed a field with *Lucerne*, in May of last year, unaccompanied with any crop; three heavy crops were taken for soiling during the summer, and on the fourth of May of the present year, it was mown for hay, a very heavy crop; thus giving four crops in the space of one year from the time of sowing the seed.

FIELD NO. IV.

Colonel T. has a field of *Lucerne*, of four acres, in full vigor; the crop, after cutting, measured three feet seven inches in length. He mowed a third crop from this field on the 21st of July.

FIELD NO. V.

M. A., Esq., in breaking up an old unproductive meadow, for the purpose of seeding it with *Lucerne* adopted the following mode. In September, the land was ploughed to the full depth of the soil, and sown with winter tares, or vetches: these were cut for hay in May, and yielded three tons per acre. The land was immediately ploughed and repeatedly harrowed and the weeds were collected and burnt: a plentiful crop of seed weeds soon made their appearance, which were ploughed down: the land was again harrowed and the weeds were again collected and burnt: this was repeated until the soil was as clean as a garden when it had a very thick coat of well rotted stable dung which was very carefully turned in, and *Lucerne* seed was sown in September, without any other crop; and during the next summer it was cut five times, either for soiling or for hay: the fifth crop for soiling was commenced cutting on the 25th September.

So far the journal, which needs no comment.

From the Zanesville Gazette.

Lucerne, or French Clover.

Lucerne, sometimes called "French Clover," is kind of grass, which, in some situations in Europe, cultivated with great advantage, and has been tried in some instances with great success in this country. It is not, strictly speaking, a clover, though in some respects similar. It is perennial—in favorable soils the roots are said to live and flourish a hundred years. Its advantages consist in affording a greater amount of foliage for any kind of stock, than any other plan according to the expense of producing it. Several years since, while residing in the State of Maine, we made several experiments with *Lucerne*, which, a though some of them terminated unfavorably, satisfied us that the most favorable soil for it is a deep ear dy loam; and as the alluvial soils on this river are generally of this character, we last spring resolved on giving it a trial here. We procured from Boston, small quantity of seed, which was sown on the river "bottom," the last week in May. As the soil has been badly managed for several years previous, we had feared that the great growth of weeds would check and smother the *Lucerne*, and to guard against this we got a chance to extirpate the weeds, we sowed the seed in drills. This was done very expeditious and exactly, with one of Ruggles, Nourse, & Mason's seed sowers.

In the latter part of the month of July the *Lucerne* had reached the height of 18 inches on an average and had considerably blossomed. We cut it and fed it green, partly to hogs and partly to milch cows—both ate it voraciously.—In just four weeks from the time it was cut, it had again grown to nearly the same height as before, and was cut a second time—and the first of November it was cut a third time—the crop being heavier than either of the preceding. A pic-

common red clover [very flourishing] immediately sowing, the soil precisely similar, did not yield near $\frac{1}{2}$ as much, in proportion, as the Lucerne.

We have no doubt that it may be cut five times a year, and will yield at the rate of a ton and a half of hay to the acre, at each cutting.

American Silk Goods.

At a meeting of the American Silk Society, held Baltimore, the 19th of Feb., a quantity of Silk Goods were exhibited from the establishment of Mr. Sapp, of Economy, Pa., and Mr. Gill, of Mount Pleasant, Ohio. The following account of them is taken from the *Journal of the Am. Silk Society*:

MISS RAPP'S SILK GOODS—CURING COCOONS.

The editor of this Journal having solicited of Miss Sapp, of Economy, Pa., the privilege of exhibiting some specimens of her silk manufactures, he received from her a case containing the following articles, viz: 3 yards black figured dress silk, 12 do. lavender figured dress silk, 1 $\frac{1}{2}$ yards green velvet, 1 $\frac{1}{2}$ yards black velvet, 3 yards plain black satin, 12 yards figured satin castings, 13 pieces fancy ribands, (165 yards,) 4 pieces of plain ribands, and a raw silk handkerchief.—These goods are all of first rate quality—heavy and durable. They were exhibited at the public meeting of the American Silk Society on the evening of the 9th of February, and elicited expressions of surprise and astonishment at the progress already made in the production of silk in this country. They furnished conclusive evidence of the important fact, that we can not only furnish all the raw material, but even the best manufactured silks from our own resources, and that all that is wanting to accomplish the great object is diffusion of knowledge among the people, and for the people to say that they will do it.

The following are extracts from the letter of Miss Sapp, that accompanied the silks. We publish them without her permission, because it will do the public more good than it can do her harm. We would recommend attention to the extract on curing cocoons with camphor. This is an important and an interesting item of information.

Economy, Pa., February 7, 1840.

HIDEON B. SMITH, Esq.—

Dear Sir—There is so great a demand for our silks, that, after supplying the wants of our society, we have an over manufacture as much as our store could sell at the annexed prices. There is, therefore, no necessity to seek a distant market. Notwithstanding this, we thought we would send you all we had ready made; as these specimens (together with those you will probably receive from other quarters) may assist you and your society a good deal, to convince every patriot that *our own, and our own people's hands themselves can produce and manufacture* this so highly beloved article of luxury, with which we are so fond to adorn ourselves, and clad in a garment of which, if thus obtained, we may justly feel a noble pride,—but, if the product of foreign hands, we have the best reason in the world to feel great shame, when we reflect, that by the way of obtaining it, we have so much and so unprofitably contributed to squander our national treasure, burden our country with an enormous debt, and thereby lay the sure foundation of ruin and misery. These specimens have all been made of silk raised within our society in the summer of 1839, (we never wove a thread of purchased silk.) In strength and durability they will surpass any imported article. The handkerchief of silk floss, or tow, you will please to accept as a small contribution to your collection of specimens; it is to show that that part of the cocoon is valuable too.

As you wish me to make any communication which I consider useful, I will offer a few remarks:

1. On the curing of cocoons. 2. On the mulberry tree, the foundation of the whole business.

1. Since we are killing our cocoons with camphor, we find them as easy to reel, at any time after the regular season, as when freshly taken from the spinning shelves. We do it as follows: for 100 lbs. of cocoons in the floss, we take a well made box, large enough to hold them, then we take about 3 oz. of camphor, which we moisten with as much alcohol as is necessary to rub it into a powder, a part of which we sprinkle on the bottom of the box, then we fill the box by making 5 or 6 layers of the cocoons, and spread a proportional part of the camphor between each of them: then we screw on the lid and paste strips of paper on all the splits and joints, to make it air-tight.—After 3 or 4 days, we take them out and dry them in the shade until perfectly light. They must be assorted before camphoring, or else the bad cocoons will spoil the good ones.

2. In regard to the mulberry, I would earnestly recommend, especially to the silk growers of the northern and middle states, not to neglect the cultivation of the white Italian or a similar mulberry as by raising the multicaulis only, the best crops (which are produced in the fore part of the summer) are lost.—The multicaulis is a most excellent addition to, but not a perfect substitute for the other kinds. They ought to go together. Several years ago we received among others a kind of mulberry under the double name of *morus brussa* or *expansa*, which we now endeavor to multiply (by grafting) as fast as possible, as it possesses all the excellent qualities of the Italian, besides having large, heavy, glossy leaves, which are gathered with less than half the labor required for the foliage of the white Italian. Such silk growers as possess this kind, would undoubtedly do well to propagate it as fast as possible with the multicaulis.

Respectfully yours,

GERTRUDE RAPP,
for GEORGE RAPP.

From the *Native American*.

Exhibition of American Manufactured Silks.

We were taken quite by surprise on Tuesday, February 18, upon entering the Rotunda at the Capitol, to find a large table spread out with silk velvets, &c., which, upon enquiry, we found to have been made by Mr. John W. Gill, at Mount Pleasant, Ohio, during the past summer. The articles exhibited consisted of large pieces of silk velvet, Terry velvet, tippet plush, hat plush, &c. &c. were all truly beautiful, and would not suffer in comparison with the most costly imported silk fabrics. Mr. Gill informed us that he commenced the silk business about a year since; that his velvets were all made from trees produced from the first year's planting; that a vest he had on was made for him in thirteen weeks from the day he planted his multicaulis buds: that he had no difficulty in finding a market for his goods; indeed some of them were sold in our presence at six dollars per yard, and, from an exact calculation made by Mr. Gill, he finds that every acre of ground planted by him in multicaulis buds last year, has yielded him \$350 net. This little exhibition, and the facts connected with it, afforded us additional evidence, that silk may be grown in all the United States, not only for domestic purposes, but also as an article of commercial export.

From the *New England Farmer*.

Report on Beet Sugar Premiums.

The Trustees of the "Massachusetts Society for the Promotion of Agriculture," impressed with the consideration of the important advantages that might be derived, as well for the benefit of the agricultural as of the manufacturing interests of the country; and being also aware that the attention of many eminent men in several foreign countries has been zealously devoted to this subject, whereby great improvement in the production of the beet and the manufacture of sugar therefrom, was in progression; were thereby induced in their proposals of premiums the last year to offer as follows, viz:

"To the person, persons, or corporation who shall raise the greatest quantity of sugar beets by the acre, not less than two acres, which shall be manufactured into sugar in the year 1839, giving a particular account of the soil and the manner of sowing, cultivating and gathering the beets, a premium of *One Hundred Dollars*."

This premium was not claimed, although the principal objects aimed at by the Trustees, viz: the soil best suited, the manner of cultivation and ingathering of the beets, are fully made to appear in the application made for the next proposed premium, having relation to the same subject, which was as follows, viz:

"To the person, persons, or corporation who shall manufacture from the sugar beet, (denominated Silesian white beet,) sugar in the greatest quantity and of the best quality, in the year 1839, giving a full and particular account of the process of manufacturing it, *One Hundred Dollars*."

For this premium there was only one claim preferred, which was from the Northampton Beet Sugar Company, by their agent, David Lee Child, Esq., who presented two several samples of common brown sugar of the usual flavor of such low priced commodity. An excellent sample also of loaf sugar, a very bright color, well grained and crystallized, and no wise inferior in appearance to the best loaf sugar manufactured from the cane. The sugar of each quality was carefully examined by the committee. It was also inspected as made use of in different articles of confectionery, by one well conversant in the art (Mr. Duoy,) who commended each sample, considering it as fully equal to sugar of the like quality from the cane.

There were also two samples of molasses, one of which appeared to be of good flavor and quality, and it was thought well suited for those purposes to which this well known article is applied for domestic use or for the Bakery.

The article of second quality may be used for the distillery, or for various gross purposes, as well as in aid of the vinegar cask. Its properties are also thought well of as nutritive for animals.

The whole process of sowing, cultivating, ingathering, and preserving the Silesian white beet, considered as the most replete with saccharine matter, and of course most suitable for manufacture, with remarks on the soil best suited for production, and a full and particular account of the whole course of the manufacturing the beet sugar through its several processes, are very minutely set forth in a pamphlet of 150 pages. This work of careful research, the committee are led to expect, will hereafter be so far abridged as to diffuse a more general knowledge than might otherwise be had.

For the several wished-for objects thus brought into notice, the community are indebted to the praiseworthy enterprise of the Northampton Beet Sugar Company, and the assiduous application and zeal of their agent, Mr. Child.

The measures thus taken in this establishment may, it is hoped, lead to a course of experiment and improvement which may, if persevered in, lead to their benefit as well as that of the public.

The Northampton Beet Sugar Company, having produced through their agent, Mr. Child, the requisite certificates as to the quantity and quality of beet sugar manufactured by them, and the same having been carefully examined and found to be severally of good quality, as herein represented, and having, also, submitted a full and particular account of the whole process of the manufacture, the committee were induced to report that they are entitled to the premium of one hundred dollars.

It may be considered, perhaps, incumbent on the committee, in closing this report, to state some facts which the treatise furnished in connexion with this subject, will if referred to, more fully show.

The cost of the brown sugar as manufactured appears to be from 5 to 6 cents per pound. In France, where nearly one hundred millions of pounds are said to be annually manufactured, being about three pounds to a person, labor, generally, much lower, and a great part of it is performed by women and children; it is done, too, at a rate less than half what is paid here.—This, as far as labor is included in the calculation, would add essentially to the cost of the sugar. There are, however, circumstances which are reasoned upon in this communication, which go far to counteract these disadvantages, viz: the cheapness of fuel, rent, buildings, &c.

The value of the pulp, too, or residuum of the beet may be of great advantage, if well distributed, in the fattening of cattle, swine, &c.

There is, in conclusion, one important object to be hoped for from the great efforts which are making in Europe as well as in this country, that the research and experiments now in exercise, may conduce to a more simple process, by which the manufacture of beet sugar may be availed of by domestic industry. This is by many confidently anticipated.

It is, however, much to be regretted, that this desired object has, in this respect, thus far, wholly failed.

All of which is submitted in behalf of the Committee. JOHN WELLES, Chairman.

Boston, 1839.

Mr. David L. Child's work on Beet Sugar has been published in Boston. The Massachusetts Agricultural Society have awarded him \$100 for his successful experiments in this town. We have not had time carefully to examine the work, but one item of importance is deducible from his publication. In France, 100,000,000 pounds of Beet Sugar are made annually, 6,000 acres of land devoted to raising Beets, and the fixed and floating capital engaged is \$28,000,000. Contrasting with this, the Cane Sugar made in the United States reaches only 60,000,000 pounds annually, 15,000 acres are cultivated with Sugar Cane, and the fixed capital employed, reaches 45,000,000! We learn a company is organized and funds subscribed in Boston to carry on the manufacture of Beet Sugar.—*Northampton (Mass.) Cour.*

Those who suffer their own grounds to be seeded with weeds permit thieves to be partakers of their substance.

A *Western Lady*.—Mrs. Stump, on White's creek, Tennessee, has manufactured a beautiful shawl from silk, grown in her own garden.

NEW GENESEE FARMER.

APRIL, 1840.

Editorial Arrangements.

Some of our correspondents and personal friends wish information respecting our editorial arrangements—we therefore state as follows:—

M. B. BATEHAM resides at Rochester, and is the publishing Editor. He receives all letters and communications, revises some for publication, makes selections, assists in correcting, &c. He writes short notices and other matters which will hereafter have no mark or signature.

J. J. THOMAS resides in Macedon, Wayne county. He examines and revises, or remarks on, such communications as are sent out to him, makes selections, and writes Hints for the Month, and other seasonal articles, which will hereafter be marked *thus*.

DAVID THOMAS resides near Aurora, Cayuga county. He will write on Horticulture, Floriculture, and the Natural Science, answer Inquiries, &c. His articles will be signed T. or marked *thus*.

Other gentlemen may occasionally contribute Editorial articles: these will have various marks.

To Correspondents.

We are constrained to offer renewed acknowledgements for the valuable assistance we have received. Every successive number of the Farmer adds new, and highly respectable names to our list of correspondents; and the consequent increasing interest of the paper must afford great satisfaction to our readers.

Several valuable communications are omitted for want of room; and others were received too late for this number, shall appear next month. We have received several on the Winter Management of Stock, &c.; but as we have already published considerable on this subject, and as our space is necessarily limited, we hope our correspondents will excuse us for deferring those at present.

Gardener's Work for April.

We had prepared some directions for performing the principal operations in the garden this month, but our columns had already become so full that we have only room for a few brief hints. The weather in this section is usually changeable, and frequently wet and cold during this month; so that seeds and plants put into the open ground very early, are often destroyed. It is not advisable to sow or plant many, except the most hardy kinds of vegetables, and such as are wanted for early use, until the weather has become fine and settled, and the ground a little warm.

Peas, Parsnips, Lettuce and Salsify, are very hardy plants, and will not suffer from a little wet or cold—sow them as early as possible. Sow some Marrowfat Peas at the same time as the smaller earlier kinds, and they will come into use in succession.

Plant Onion sets as early as possible—sow the seed about the last of the month. Beets and Carrots for summer use should be sown now, but those for winter will be better if sown later. Peppergrass, Parsley and Endive, should be sown this month.

Cabbage, Cauliflower, Broccoli, Celery and Tomato, if not sown on a hot-bed, as directed, may be sown this month, on a warm border of fine earth, where they can be protected by a mat in severe weather and frosty nights.

Beans, Corn, Cucumbers, Melons, Squashes, &c., will not bear frost, and should not be planted till next month. (Some of these seeds will invariably rot, if the weather be cold and wet.)

Radishes and Turnips are hardy plants, but need to grow rapidly in order to be good; and therefore should not be sown till warm weather.

Flower seeds may be sown the latter part of the month, if the ground is dry and the weather warm.—The following remarks on this subject, are by one whose experience and success in the culture of flowers, entitles him to much deference:

Sowing or Planting Flower Seeds.

For large seeds like the Bean or the Pea, a coarse soil is well adapted, as they can force their way to the surface from any moderate depth; but small seeds require different treatment; and we lay it down as a safe rule, the finer the seed, the finer should be the soil.

How does Nature, exemplifying Supreme Wisdom, sow her more delicate seeds? She scatters them on the shady ground, trusting to the rain or the frost to cover them, (of course slightly,) and they germinate before the sun has acquired power enough to scorch them.—The duck-like seeds of the Orisib and Cypripedium sometimes grow in beds of damp moss.

Common garden loam, whether clayey or sandy, is much improved by a dressing of vegetable earth from

the woods, well mixed before planting. It prepared in the preceding autumn, and pulverized by the frost, all the better.

Such a soil is favorable to seeds of almost any kind, but essential to the finer and more delicate sorts. The preparation of the soil alone, however, is not enough. Fine seeds may be smothered if covered more than from one eighth to half an inch deep: and their short roots may be parched if exposed to the sun except in morning and evening. To a fine soil, therefore, we must add the protection of shade, and in time of drought, a regular supply of moisture. If the seeds are sown in an open border, a sprinkling of water in the evenings is best, but carefully abstain from applying so much as will make the ground.

In gardens of considerable extent, when new seeds are to be sown, and nothing is known in regard to their germination, it would be prudent to try them in different soils and situations. We have succeeded in one spot and failed in all the rest.

It is generally safer to plant or sow when the danger from severe frost is over. Deposit the seeds in shallow drills made by pressing down the edge of a board on the loose soil, and cover by sprinkling the earth over them. Drills have two advantages; we can better determine how deep the seeds are covered, and we know where to look for the young plants, as we watch for their appearance from day to day.

Marking sticks, or labels, are conveniently made from shingles, and may be made one inch wide and a foot long, with one end sharpened, more easily to penetrate the ground. For annuals, nothing more is wanted than to moisten the part to be written on, and draw it across a dusty sleeve. The fine grit thus imparted will wear off the black lead as the pencil passes over, and it will be legible for the season at least.—But where the mark is wanted for two or more years, the stick should be painted, and then the letters will be durable.

Some plants are coarse feeders, and do best when well supplied with manure from the stable. Of this kind is the beautiful Cypress Vine, so remarkable for the delicacy of its leaves, and the brightness of its flowers. T.

The First Flowers of Spring.

ON THE 20TH. OF LAST MONTH.—(MARCH.)

The snow drops are early risers—in the season; and for more than a fortnight have hung out their white bells over the cold or frozen ground. Closely following in the order of time, is the Winter Aconite with its tuft of green leaves and yellow bloom; and next the little Crocus (cloth of gold) just peeping above the soil. It is of a deeper yellow than the Aconite, and on the outside it is striped with dark purple.

A few days more of this fickle season pass away, and the Scotch Crocus appears. Its fine white cup is also striped on the outside with purple; and soon after the large yellow Crocus opens. To this succeeds the Siberian Squill, just raising its beautiful blue above the earth.

Again the garden is whitened with snow, which melts in the morning beam, and the purple Crocus striped with white, the large rich blue-purple, and the pure white Crocus, stand together in colors beautifully contrasted, while the rosy corols of the Bulbo-codium increase the variety. But we will not go in advance of the season.

The pleasure of viewing those stars of the earth—the first flowers of the spring,—is a rich reward for cultivating them, and truly they belong to a class "that asks but little room." A bed, three feet wide, and twelve or fifteen feet long, would exhibit them in masses, nearly all at the same time, from which no well balanced mind, no correct taste, and no well-organized vision, can turn away with indifference. †

Spring Rye.

We are happy to say there is not much really poor land in this section; but if any of our readers should happen to have a piece "too poor to grow beans," we would advise them to try Spring Rye. The seed can be obtained at the Seed Store, of a quality superior to many samples of the Winter variety. It should be sown as early as the ground will readily admit (in the middle of April or before); and at the rate of 3 pecks of seed to the acre. The produce will depend on the quality of the soil—but 20 bushels per acre may be called an average crop on poor land.

Grass Peas.

These peas we believe will be found valuable to farmers, as soon as their proper use is understood.—They are not liable to be injured by bugs or mildew; and the straw being fine and sweet, it makes excellent fodder for sheep or cattle, whether fed in a green or a dry state. A good way to use them, is to mow them as soon as the peas begin to ripen, and before the straw is dead, and after curing like clover, put them into a Mow or Stack, and feed them out without threshing, to Sheep and Cattle in Winter. They will eat them readily, and the grain being in the straw, it makes very wholesome and nutritious food.

The peas are small and hard, and grow so crowded in the pods as to flatten the grain and give it a peculiar appearance. The plants tiller very freely, and one bushel seed is sufficient for an acre. Sow early in the Spring—and the crop will come off in season, and leave the land in good order for wheat.

Planting Early Potatoes.

A soil is rendered warmer by a fresh dressing of stable manure; and also more loose for the roots to spread through, & the potatoes to expand in. This is of great account in obtaining them early. There is another thing, however, of great moment. Full-sized potatoes should be selected for planting; and of these, only three or four of the most prominent eyes should be permitted to grow, the rest to be carefully cut out or destroyed. This precaution will hasten the growth of the stems, by turning all the nutriment of the tuber into them, and by preventing its being wasted on the feeble shoots.

Two or three years ago, we obtained a rare sort of potatoes; and desirous to make the most of them, we cut each of them into several pieces, and planted them in rows without having assorted them. The result was a great inequality in their growths. Some were six inches high before others appeared, especially those that were from buds near the stem end of the potato; and the prospect was rather discredit to the gardener. But this was not all: there was quite as much difference in the time of their producing potatoes.

In a light rich soil, not much infested by weeds, we have had the hills made at the time of planting; but the hilling can be done afterwards if care be taken not to cut or disturb the roots when the young potatoes are forming. It should be remembered, however, that this plant, though impatient of stagnant water, requires much moisture to mature a good crop; and as its leaves turn off the rain from the base of the stems, the hills should be made *dishing*, that is, hollow in the middle, in order to collect the rain and turn it inward.

Now who will have the first mess of early potatoes? It is always a fine treat; but to have them, we must have the earliest sorts as well as horticultural skill. T.

Seed Store Agencies.

The Agents for the Rochester Seed Store, (as mentioned on our last page,) are now all supplied with fine assortments of Garden, Field, and Flower Seeds. The Garden Seeds are put up in small papers, and the Field Seeds in packages, by weight or measure. Any Seeds which they may not have on hand, may be ordered, through them, from the Rochester Seed Store. The proprietor pledges his reputation, and that of his establishment, for the good quality of the seeds furnished by him this season. Seed Catalogues, and back numbers of the New Genesee Farmer may be had of the agents.

Agents and Correspondents for this paper, who wish to obtain rare seeds for trial, (gratis,) will please inform the proprietor of the Seed Store in what way they can be sent; and name what particular kind would be preferred. Or whether Grass, Grass, Vegetable, or Flower Seeds, would be most acceptable.

M. B. BATEHAM.

Seed Store Correspondence.

The subscriber is always willing to communicate information to all those who desire it by letter, (except those who tax him with postage,) but at this season of the year he receives such a multitude of letters of inquiry, (besides orders,) that it is sometimes impossible for him to bestow that immediate and particular attention which is desired; and his answers may sometimes be rather too brief to give satisfaction, or too abrupt to appear courteous. Notwithstanding he has good assistance, he is often compelled to burn the midnight oil in writing letters; and he begs, therefore, that his friends will not attribute a little delay, or a short reply, to any want of attention or courtesy on his part.

Information which is often asked of him by letter, is published in the New Genesee Farmer, and therefore persons may receive a paper when they expect a letter. If any man cannot afford to pay fifty cents a year for the information which this paper contains, I cannot afford to write letters for his special benefit.

Persons sending Newspapers to the Subscriber, are requested to address them to the "New Genesee Farmer," as he then receives them free of postage. He is always thankful for papers containing any matter of interest to him or the agricultural community. M. B. BATEHAM.

Corrected.—On page 51, (this number,) 3d. column, at the head of the article on the culture of Bush Cranberries, *Taxonomy* should read *Phytology*.

THE LOCKLIN PATENT PLOUGH.

The Plough represented above, is manufactured in this city, by A. J. LANGWORTHY, who informs us that the demand has been so great for them heretofore, that he could not possibly supply it; and he has now made arrangements for building *Two Thousand*. They have been known in this section only two years; but are already in use by many of the best practical farmers in this county, all of whom, we believe, give them a decided approval. The ploughs are well made, strong, and handsome; and, from their peculiar form, they are said to run much easier than any other kind; while, at the same time, they do as much work, and do it as well, whether in sward land or any other.

Mr. L. also possesses the right, and manufactures "*Whiting's Prairie Plough*," which has not yet been much used here, but has obtained great celebrity in some parts of the country. It is not only calculated for prairie or sward land, but is well adapted to all ordinary soils.

Both kinds may be examined at the Rochester Agricultural Repository and Seed Store, where they are kept for Sale. Price, \$9 each.

ARNOLD'S HORSE POWER MACHINE.

This Machine was somewhat prematurely brought before the public last year; and, owing to the ill adaptation of the Thrasher, and some other defects in the Machine, it did not fully meet the expectations of the purchasers. We are happy, however, to state that we believe these difficulties now to be entirely removed, and that the Horse Power and Thrashers, as now constructed by MR. ARNOLD, will be found superior to all other machines for the purpose—give general satisfaction to purchasers, and prove of great benefit to the farming community.

Farmers have long felt the need of some machine like this, which, while it is not very expensive, will do the work well and with sufficient expedition; is light and portable, occupies but little space, and can be used in any barn; and by means of which the farmer can thrash his grain whenever it suits his own convenience, without being dependent on his neighbors for extra men or horses. We therefore take pleasure in recommending Arnold's Horse Power to the attention of all who feel that such a machine is a desideratum; and we ask them to give his advertisement a candid perusal. (See last page.)

For the *New Genesee Farmer*.

Merchant's Corn Planter--("Baldwin's.")

Messrs. Editors—In the notice of a Corn Planter in your first No. of the *New Genesee Farmer*, there is an error in the name, which we wish to correct.—The machine was invented and patented by N. R. & O. G. Merchant; we have now sold the right to Alfred Baldwin, but the machine should retain the name of the Patentees.

Communications to be addressed to Alfred Baldwin, Guilford, Chenango Co., N. Y.

Guilford, March 9, 1840. N. R. & O. G. MERCHANT,
to the Editors of the *New Genesee Farmer*—

Accompanying a sketch and notice of a Corn Planter (invented by N. R. & O. G. Merchant, of Guilford, N. Y.) in the first No. of the *New Genesee Farmer*, is a request that those who have used it would give some account of its operation. I take pleasure in stating that I have frequently examined it, and have seen it in operation, and am fully satisfied that it is one of the greatest labor-saving machines that has been presented to the farmer. Its construction for durability, and accuracy in performing the work, is not ex-

celled by any thing that I have seen. It drops regularly, at 9, 12, 18, 24 and 36 inches distance, at any required depth, or any quantity at a time.

Yours, Respectfully, ALPHEUS JOHNSON.

We have seen the operation of Merchant's Corn Planter, and fully concur in the above recommendation.

WM. W. CABLE,

Guilford, March 11, 1840. LEWIS H. NASH.

REMARKS—Since writing our former description, great improvements have been made in the construction of this machine, and it is now made in a very perfect and durable manner. We think it will be found well adapted to the purpose designed. It is intended principally for planting corn, but will plant most other kinds of seeds with facility. The only important objection which we can discover, is the price; still, any farmer who has much corn to plant, or any two or three farms together, may save much more than the cost of the machine, by a few days' use of it.

Mr. Baldwin has left several of the improved machines at the Rochester Agricultural Repository, where they can be examined. The price is \$24.

Beet Sugar--Inquiry.

In the year 1838, Joseph Hurd, Jr., of Boston, obtained a patent for making sugar from beets. In his specification, he says, "what I claim as my invention, is the preparing of the beets by exposing them in thin slices to the action of frost, after which they may be directly thawed and submitted to pressure; or they may be dried by a current of cold air, and" at any convenient time steeped in pure water, which will extract the sugar.

In another part of the specification he says the thickness of the slices should not exceed the eighth of an inch; and that the slicing should be done in a freezing temperature. "This freezing is an essential point in my process; this, together with the dispensing with the use of lime, and the producing of sugar without molasses,—may be denominated its characteristic features."

Now what I wish to learn is, whether this plan has been brought into successful operation? X.

Another Inquiry.

Messrs. Editors—Will you or any of your correspondents inform us how to make Beet Sugar to the best advantage, on a small scale for family use? I tried a small experiment in the business last fall, but did not succeed. I made molasses very readily, but how to get it into sugar, I could not devise. It seemed to require some peculiar process to make it crystallize; and if you can inform me what that process is, I will try it again next fall. L. L.

Remarks.—We could furnish L. L. with a partial answer to his inquiry, but as he is not in a hurry, we will defer it for the present, and request some of our friends, who can speak from experience, to favor us with an answer.

Descriptive list of Beets, Mangel Wurtzel, &c.

The beet family is one of great and increasing importance to both farmers and gardeners in this country. The following list contains some new and valuable kinds, not heretofore known in this section, the seeds of which have been obtained at a great expense, by the proprietor of the Rochester Seed Store.

Field Beets.

Red Mangel Wurtzel.—This beet is too well known to need any description. It is much cultivated for feeding stock, and is found to be a very productive and valuable crop. The roots are large, long, and grow much above ground; are of a reddish color, sometimes clouded with white. The flesh is firm, sweet, and juicy, but rather coarse and unfit for table use except when young. They are of quicker growth than many of the garden beets, and are excellent for the table early in summer. The father of the writer sold large quantities of them in this city, as early beets, twelve years ago, when the name of *mangel wurtzel* was as little known here as *morus multicaulis*.

The Turnip-rooted Mangel Wurtzel is a new variety, cultivated to a small extent in England, but not as productive as the preceding, and not thought to be worth introducing.

Yellow Mangel Wurtzel.—This is an improved variety of the yellow sugar beet, found in cultivation near London. The roots are longer, larger, and grow more above ground than the sugar beets, and are better shaped, of fine texture, sweeter and more nutritious than the common mangel wurtzel. They do not grow so large, but they will bear planting thicker, and probably produce as much per acre, as the red variety.

White and Yellow Sugar Beets.—These two varieties are very much alike in all respects except color. They have been found to contain more saccharine matter than the other large kinds, and consequently are most cultivated for making sugar. The yellow was formerly most esteemed for this purpose, but of late the white variety has been most used. The difference, however, is admitted to be very small. The sugar beets are by many farmers preferred to the mangel wurtzel, for feeding stock; as they are thought to be sweeter and more nutritious, and equally productive if rightly planted. A good supply of imported seed is on hand.

Garden Beets.

Common Long Blood.—This variety is most commonly cultivated and well known. When true and perfect, the roots are of good size, long, smooth, and of a uniform dark red color outside and within.—From some causes, however, not well understood, it is very apt to degenerate, and lose its true form and color, even when great pains are taken in the selection of roots for seed. So that it is extremely difficult to obtain seed of perfect quality.

Long Dark Blood.—This beautiful variety was first seen by the subscriber in the London market, last September. It is there sold principally for garnishing dishes of meat, &c., on the table, on account of its rich deep color. The roots are not quite as large or as long as the common long blood; but the flesh is finer and of a much deeper color. The tops and leaves are small, and of an iron deep red color. A good supply of the seed was obtained, and it is believed it will prove a valuable acquisition to our gardens.

Superb Dark Blood.—This seed was obtained at the Highland Society's Agricultural Museum and Seed Store, Edinburgh. It is said to be still darker than the preceding; roots and tops rather smaller.

Early Bassano Beet.—This is an entirely new variety, the seed of which is from the same source as the last. The roots are round or turnip-shaped; of a bright red color outside, and pure white within; flesh fine, sweet and tender. It is of quick growth, and will probably be found a very superior early beet.

Early Blood Turnip.—This variety is pretty well known in this section, and generally esteemed for early table use. The roots are short and round, of fine texture and deep blood color. Unlike most of the early beets, this variety is not apt to become hard or sticky, but is equally good for late or early use.

Early Long Red.—This is a very handsome and good early beet, well calculated for market gardeners. The roots are large, long, and of a bright red color, but are apt to become coarse and hard when old or overgrown.

Early Red Scarcity.—Similar to the preceding; but rather earlier, and not quite so long and handsome.

Early White Scarcity.—Like the white sugar, but more early, rather smaller, and of finer texture—excellent for greens and early use.

Large White Green Top Carrot.

This is a new variety of the Carrot, recently introduced from France. The roots are large, smooth, and white, excepting the upper part, which stands out of the ground, and is green. I first saw them at the Horticultural Exhibition at Canterbury, (Eng.) where a premium was awarded them. Mr. C. N. Bement exhibited half a dozen of these carrots at the Albany Horticultural Fair, last fall, where a premium was awarded them. They are said to be sweet and good for the table, and they will probably prove a valuable kind for stock.

Long Altringham Carrot.

When genuine, this is a large handsome carrot, and in England is commonly considered the most profitable kind. The roots are of a finer texture than the orange variety, and have a smaller heart. The upper part of the roots grow above the surface of the ground, and are of a greenish color. This variety is very apt to sport and degenerate, so that it is difficult to obtain it genuine, even when care is taken to select the roots for seed.

New Species of Birds and Quadrupeds.

Many of our readers will recollect the notices which appeared from time to time in the Genesee Farmer, relative to the enterprising young naturalist, John K. Townsend, who went in company with Professor Nuttall up the Missouri, and across the Rocky Mountains to the Western Coast, visiting the

Sandwich Islands on their way home. He has since published a volume of Travels, but the number of copies printed was too limited to supply the demand, and we have failed to procure one. A letter written about two years ago by one of his friends, however, immediately after a visit to this distinguished traveller, is now lying before us, from which we learn the following particulars:—

"I saw two Condors which he had killed and skinned—they are male and female. The male measures twelve feet across the wings—the other nine feet.—Except a young one, these are the first specimens bro't to this country. I also saw some fine wolf skins of a new species, and various other quadrupeds. He discovered about thirty new species of birds on the Western Coast and on the islands. Twelve of these have been figured by Audubon in his splendid work on Ornithology, but the descriptions were written by J. K. T., who has forwarded twelve more new species.

"Near Fort William, on a branch of the Columbia river, he saw a mammy, and her preservation was complete, although she had been suspended on a large tree for twenty years in a canoe.

"Amongst a great variety of accoutrements and utensils, I saw a splendid dress of bird-skins and feathers, beautiful stone pipes carved out of a kind of slate, and a stone adze that would cut the hardest oak with expedition.—But there is not room in a letter to give even an idea of his curiosities, natural and artificial." †

De-marchais gave the wings of the Condor a stretch of eighteen feet!

Retarding the bloom of Fruit Trees.

Apricot and peach trees are more frequently rendered unfruitful by the buds starting to grow early in winter, and then perishing by the intense cold that follows. We had a remarkable instance of the truth of this remark, a few years ago. About mid-winter, a thaw came on, and continued several days, with so high a temperature, that most of the buds swelled, except a few near the tops of the trees, which were more remote from the reflected heat, and the buds on some of the low branches which were enveloped in snow-drifts. In regard to the latter more especially, the appearance in summer was very singular, for those limbs were loaded with fruit, while there was very little on other parts of the tree.

But whether the winter or the spring be most fatal to the buds, it has been considered by some gardeners a good application of labor to cover up the snow round the trees with straw, or litter from the barn-yard, in order to chill and retard the ascent of the sap; and on sandy soils we have had strong testimony in favor of its efficacy. It has been suggested, however, that too much credit has been allowed to these experiments, and, as a proof, it is stated that a rose standing on the outside of a Green House, had a stem that bloomed on the inside while its roots were exposed to the frost and snow of winter. From this circumstance it has been argued that peach buds would start in warm air if the roots were cased in ice.

The following fact, however, bears the other way: A year ago one of our apple trees had several cords of wood piled round it, *ou end*, and the pile remained there until the spring was past. The consequence was that the tree was a full fortnight later in coming into bloom. †

Miscellaneous Items.

Economy is generally despised as a low virtue, tending to make people ungenerous and selfish. This is true of avarice; but it is not so of economy.—L. M. Child.

Black-lead for Stores.—Mix powder of black-lead with a little common gin, or the dregs of red Port wine, [would not pure alcohol be better?] and lay it on the stove with a piece of linen rag; then with a clean, dry, and close, but not hard brush, dipped in dry black-lead powder, rub it to a beautiful brightness. This will be found to produce a much finer and richer varnish on the cast iron, than either boiling the black-

lead with small beer and soap, or mixing it with white of an egg, &c., which are the methods commonly practised.—*Domestic Encyclopedia.*

Indian Cake.—[*Johnny Cake.*]—One quart of sifted meal, two great spoonfuls of molasses, two tea-spoonfuls of salt, a bit of shortening half as big as a hen's egg, stirred together; make it pretty moist with scalding water, put it into a well greased pan, smooth over the surface with a spoon, and bake it brown on both sides. A little stewed pumpkin, scalded with meal, [much] improves the cake. Split and dipped in butter it makes a very nice toast.—*Fragal Housewife.*

The above, it will be perceived, can be made in the absence of milk; and a lady of our particular acquaintance who has tried it, assures us of its excellence.—She has also furnished us with the following:—

Dough Nuts.—Nine pounds of flour, three of sugar, two of butter, one quart yeast, and one table-spoonful of cinnamon. The yeast, (or two tea-cups of hop emptins,) with one quart of the flour, and three pints of water, should be mixed at night, and the rest of the ingredients added in the morning. After standing several hours to become light, they are fried in the usual way. As they absorb less fat the hotter it is, and as a small quantity of fat becomes sooner cooled as they are thrown in, the more they are fried in the less they will absorb.

To remove Ink Spots.—Ink spots on the pages of a book may be removed by washing them with a solution of oxalic acid in water, and afterwards with pure water. Oxalic acid being a poison, caution is required in using it. We have in this way completely removed fresh ink spots on books and left the type fair and white, and old ink spots have been nearly obliterated.

Frosted Feet.—The troublesome inflammation and insupportable itching produced by freezing the feet, we have found to be very effectually removed by the application of oil of peppermint.

Ardent Spirits for Rats.—It is said that an inn-keeper, who was much troubled with rats, observing the effects of spirits upon his biped customers, resolved to try the same experiment upon the rats. He accordingly made an alluring preparation of alcohol, set it in his cellar, and waited the event. The next morning he found fourteen of these interesting little fellows lying around the vessel. He pursued the plan till he effectually routed them.

Boots.

My boots have no holes in them, and yet when I go into the snow, the cold strikes right through them, and my feet become damp.

Have they been well greased?

Yes—but I don't like to soak them so much with grease as to soil my socks as soon as I put them on.

Well, there is a way to avoid all that, I lately applied grafting wax to my boots, and now no water can pass through the leather—my feet are kept dry, and of course much warmer.

How is grafting wax made?

Two and a half pounds of ro-in, one of bees-wax, and one of tallow, melted together, makes a fine batch.

But will it soak into the leather?

Not unless the leather is made very warm. It must be made much warmer than when we apply tallow, (be careful not to burn it) and then it will readily soak in. One, two, or three coats, may be applied immediately one after another.

May I communicate this for the *New Genesee Farmer*?

I am willing, but I am not certain that it is new. The "fishermen of Marble Head," or some others down east, have long had a way to render their boots impervious to the water, but I believe they use fish oil instead of tallow.

That constitutes no objection to my sending this to the "Farmer." Such papers, like the treasure of the householder mentioned in scripture, ought to contain "things new and old." Old things are new to them who have not learned them.

For the New Genesee Farmer.

The Root Culture.

There are many, and urgent reasons why farmers generally should engage more extensively than they have yet done in the business of *Root Cultivation*.—That it is both practical and profitable, no longer admits of a doubt. My own experience, and the testimony of hundreds of others, has fully satisfied me on this point. In order to induce farmers to engage in this business, it is necessary to convince them that it will be for their interests. Let us look therefore at a few of the advantages which will arise from an extension of the Root Culture.

First, then, let it be remembered that our staple commodity in Western New York, is *wheat*. To increase his funds, the farmer is constantly studying to bring the greatest possible number of acres into the production of wheat—consequently he cuts but little hay, and, of course, he keeps only a few cattle: and these he is often compelled to winter principally on *straw*; or, to keep them from *misery* and starvation, he is compelled to purchase bran and shorts of the miller. When business first took this turn, bran could be purchased for 3 cents per bushel; and then the cattle and sheep could be wintered without running down in flesh, and the cows would yield generous messes of milk. Every farmer, therefore, pressed forward to the miller to lay in his winter store of shorts and bran; consequently the demand for these articles increased beyond the supply; the prices increased, till shorts were from sixteen to twenty-five cents per bushel.—What then was to be done? Every one, in the city, the village, and the country, the farmer, the merchant, and the mechanic—every one who kept a horse, cow, pig, or sheep, must have something to feed it on. So many acres were in wheat, that *hay* was scarce; and now there were so many farmers feeding their cattle, horses, sheep, and hogs, on shorts, that they also are *scarce and dear*. What then is to be done?—Either give up the raising of stock, or keep them poor and miserable, which no good farmer will consent to do; or produce your own food for them. But what can they produce, and yet not diminish the production of wheat?

To answer this question, and to remove all these difficulties, the *root-culture* comes directly to our aid. This system will keep all our stock well, and yet enable us to retain our coveted acres for wheat. It comes to the farmer's aid when he wants relief from the high prices of mill feed; when he wants to continue keeping his stock, and especially when he wants the means to increase the fertility of his land.

In reference, therefore, to the *root-culture*, it arose from the *necessity* of the case, and herein is verified the old maxim, that "necessity is the mother of invention." The advantages arising from this system are numerous.

1st. It affords a large amount of food for stock, from a comparatively small extent of land. This has often been fully verified by experiments and estimates.

2d. It relieves the farmer from the difficulty of raising money to purchase mill feed, and enables him, by his own labor, to turn his produce into money. It increases the amount of his beef, his butter, his pork, and his mutton. One of the first and most important principles of domestic economy is, to feed the farm stock on the produce of the farm.

3d. The root-culture improves the condition of the land by its depth, and in its tendency to keep the

land clean. Every field, suitable for a hoed crop, ought to receive one as often as four years. Where the June and Blue grasses prevail, they are very pernicious to all other plants, by monopolizing their food. Unless these grasses are exterminated, no crops can flourish; and certainly the most effectual instruments of extermination are the plough, the cultivator, and the hoe.

4th. The root-culture also *enriches* the land. Land may be *dry and clean*, but if it is not also *rich*, it does not return a heavy crop to the laborer. The application of manure to land intended for roots, is, on all hands, admitted to be absolutely necessary. Without its application, the business is slim and unprofitable.

5th. This system renders the application of manure *practicable* to a far greater extent. Its quality is improved and its quantity much increased. Every farmer knows that the manure of cattle fed only on dry straw or hay, is dry, and very much destitute of those enriching and nutritious properties contained in the manure of cattle that are fed on roots.

I will now give some account of my own experiments in the root culture. In the first place, I have become fully convinced of the necessity of having the land free from grass and weeds. In 1835 I sowed about an acre of ruta бага, on good sandy loam soil, somewhat infected with June grass. The land was well prepared, but the weather being moist, the grass was not killed, and it soon sprang up very thickly.—This rendered the after culture very difficult and vexatious; and, with all my patient and persevering efforts, I found it impossible wholly to subdue the June grass, and I fully coincide with friend Garbutt in the belief that it would be well for Western New-York if this grass could be entirely exterminated. From my sad experience with this grassy patch, I became fully determined never to be caught in this same way again.

I last year selected a clean piece of land for my ruta бага crop; ploughed in a dressing of good manure; ploughed it shallow the second time and harrowed it smooth. I then took a light plough and made ridges, about two feet apart. I had no drill-barrow, but took a common wheel barrow and rolled it along on the top of the ridges, so as to make a small furrow or drill, into which the seeds were sown by hand. A third person followed with a rake, so as to cover the seed, and leave the top of the ridges smooth.

I prepared my seed by putting it into a basin and mixing with it about half a pound of sulphur; because I had read, either in the Farmer or in the Cultivator, a recommendation of sulphur to be used in this way, for the purpose of fixing its flavor in the seed to keep off the fly.

The seed soon sprang up. The turnips were not injured by the fly; and whether it was the sulphur which prevented the depredations of the fly, I know not. The season was not dry, and therefore unfavorable to the propagation of the turnip fly. I thinned the plants to ten or twelve inches apart. They grew rapidly and flourished through the whole season.—They were hoed thoroughly, twice. They were harvested towards the last of October, and deposited in trenches three feet deep and four wide, and the turnips were raised about a foot above the surface of the earth. However, before putting the turnips into the trench, I put crotches into the middle of the trench, about eight feet apart, and rising above the surface eighteen inches. I laid a ridge pole on the top of these crotches for the purpose of forming a roof, of small sticks, brush and straw, and lastly earth. The roots being stored in this manner, a boy can enter the trench with his basket at any time in the depth of winter, and is never exposed to the inconvenience of a falling roof. Precautionary steps against their heating are always to be taken, by leaving small apertures for the escape of heat and admission of air.

After having produced and stored your crop of Ruta Baga, what use do you make of them? Hogs that are three or four months old and upwards, will live well on them; but if they are younger, they ought not to be confined exclusively to them. Cooking them renders them much more nutritious for hogs and pigs. They are excellent for cattle and sheep of every age. When sheep are confined for a few weeks in the yard for winter, they pine to be grazing in the field unless they are fed on roots; but when permitted to enjoy this food, they have not half so much hankering for the field.

I will take the liberty of mentioning one thing, among many others, which may be of considerable use to the inexperienced; and that is, it is of no use to cut up the turnips small and fine for the sheep. Scatter them over the ground or hard snow, and then follow with the shovel and slice them a few times each, for sheep delight much in gnawing the turnip. For two winters I was in the habit of cutting my turnips into small pieces, not larger than a hickory nut for my sheep. I have since found this to be entirely unnecessary.

I will furthermore add, for the benefit of the inexperienced, not to dig trenches for the reception of roots where they will be exposed to be filled in with water, when the snow melts, and the earth is filled with water.

One corner of my ground was considerably inclined to clay, and here the turnips were quite small. That kind of soil is wholly unfit for them. P.

Chili, March 15th, 1840.

For the New Genesee Farmer.

The best time for Cutting Timber.

This is a subject in which every farmer is deeply interested. If timber cut at one season will last *years* longer than that cut at another—if one time is preferable to another, as regards its durability—then certainly it is a subject well worth the notice and consideration of every farmer. There seems to be a diversity of opinion as to the right time. All agree, however, that here is a right season, but disagree very materially as to that *particular time*. It is stated in the Gen. Far., vol. 5., p. 41, that February is the best time. Also, in vol. 4., p. 97., "In a book printed at Philadelphia, soon after the revolutionary war, the author says, 'Long experience, I think, hath sufficiently ascertained, that timber cut down in the spring of the year, when full of sap, and the leaves fully expanded, is much more durable than when cut at any other time.'" Dr. Deane, in his New England Farmer, says, "An abundant mass of evidence has been produced to show, that timber should be cut or felled in mid-summer, with a view to its durability;" but, abundant as it is, we must take the liberty to add to the "mass." In the same article, the Ed. says, "One of our neighbors, a practical farmer and close observer, lately informed us, that twenty-two years ago he had a fence made chiefly of basswood (linden) rails, cut just about mid-summer, and at this time they are sound and good.—In conversation, not long since, with another excellent farmer, he said the best time for cutting timber was in autumn, about the fall of the leaf, or soon after, and that it was not only more durable, but more compact than after it had been loosened by freezing."

I was conversing, a few days since, with an intelligent farmer, who said the best time to cut rail timber was in January and February. Also, with another who was of the same opinion; the latter said this was the time that all cut their timber "down country." Another farmer very recently informed me, that mid-summer was, beyond all doubt, the right time. He said that his practice was to pull off the bark, and keep the rails off from the ground; that they would season sooner, and last many years longer than if cut at any other season.

Perhaps the majority of farmers think February the best time, at least it is to be judged they do, by their practice. I am convinced, however, that this is not the right season. From the information I have obtained, and by the little experience I have had, I am induced to believe that *mid-summer* is the *right time*. It is very evident that rails (or any timber) decorticated or peeled, will season quicker and last longer than they will if the bark remains. I will now conclude by adding an extract from a communication of Joshua Howard, [Gen. Far., vol. 5, p. 300.] "During the last twenty years I have been engaged, more or less, in the preservation of timber; and, from my experience, am able to say with confidence, the old opinion of English writers to the contrary notwithstanding, that the best time to cut timber to ensure its durability is when the tree is in its GREATEST VIGOR, and, in this latitude, say middle of June; then the sap is in its most fluid state, and entirely escapes through the several pores of the tree."

CULTOR.

Cayuga Co., Feb. 21st., 1840.

[For the New Genesee Farmer,

Monroe County Agricultural Society.

MESRS. EDITORS—Noticing in the second number of your paper an appeal to the farmers in this county, calling their attention to the importance of a society for the improvement of agriculture, and soliciting those who feel an interest in the subject to make it known to you, I am induced to address you in favor of the proposed society. Not that I would take my pen thinking to instruct my brother farmers, but because I think an Agricultural Society in this county so highly important, that I am anxious to volunteer my aid in promotion of the object.

We do not rightly estimate the advantages which arise from such associations, when we merely consider our own immediate interests, as we are very apt to do. The benefits of such a society will be seen long hereafter, perhaps more so than at present; and this is one reason why many farmers are indifferent on the subject. The desire to reap *immediate* rewards on ourselves, regardless of the *future* and the good of others, is one great reason why so little is done for the improvement of agriculture, or the real benefit of the community. The difficulty is not so much the result of *ignorance* as it is of *selfishness*. A want of *information* is one, but a want of the principles of enlarged *benevolence* and enlightened *philanthropy*, is a much greater hindrance of agricultural as well as moral improvement. And how can we better cultivate and disseminate those principles, which we deem so important, than by associating ourselves together for mutual improvement and encouragement, and with a view to the general good of the community—the happiness and prosperity of man?

The importance of an Agricultural Society is not altogether in the amount of new and useful knowledge which might be gained, (although this might be no inconsiderable item,) but in the *general spirit of improvement which would be diffused throughout the farming community*. We do not want knowledge so much as we do something to excite us to action, and put in exercise the knowledge which we already possess. We all know that to till our land well, and keep it richly manured, to adopt a judicious rotation of crops, select the best kinds of seeds, and the best breeds of stock, are matters of much importance, and indispensable to a perfect system of farming. That there are better varieties of grain and seeds, and finer breeds of cattle, than those in common use, all will admit, although some may not possess the means of availing themselves of these improvements; but the want that is wanted is a proper stimulus to set them about the work.

It is not an easy task for a man to abandon his former views and practices, and adopt new ones, differing

from his neighbors, although he may be well convinced that it would be an improvement. Especially is this the case, when others, all around him, his friends and brother farmers, are looking on with indifference and neglect. But let others around him engage in the business of improvement—let it become a public business and a popular subject, and how easy and pleasant it is for all to engage in it? Let us therefore form an efficient Agricultural Society, and see that it is well sustained, as I believe it may be, and we shall soon see a spirit of improvement, pervading the whole farming community, and not only shall we and our children reap an abundant reward, but its beneficial influence will be felt throughout all classes, and extend to every interest of the community. Elevate and improve the yeomanry of our country, and we promote the happiness and prosperity of the nation.

The commencing of such a society must depend upon a few influential farmers—many will unite in sustaining who are unwilling to assist in forming it—and the sooner an effort is made I think the better. I am of the opinion that it should be commenced previous to the hurrying of farming operations in the spring. Yours, &c. R.

Sweden, Mar. 20.

P. S. Messrs. Editors—What I have written is unfit for publication; but it may elude you one more friend of improvement, and one more name in favor of an Agricultural Society.

Remarks.—We think R. has taken a very correct view of the importance of an Agricultural Society, and we hope his remarks will stimulate others to take an interest in the subject. We wish to contradict two statements in his postscript, however. *It is not true* that what he has written "is unfit for publication." 2d. We deny that he has shown us "one more name in favor of an Agricultural Society"—for the simple reason that *he gave us no name*, and is entirely unknown to us. We hope R. will let us hear from him again, and supply this deficiency.—Eds. *New Gen. Far.*

Formation of the Yates County Agricultural Society.

It gives us pleasure to notice any efforts which are made for the promotion of the great cause in which we are engaged. Especially are we pleased to receive accounts of the formation of new Agricultural Societies. Agriculture is the life and support of all other arts and professions—the foundation of our National as well as individual prosperity; and there never was a time when there was more need of united efforts for its promotion than at present. Let efficient societies for this purpose be formed in every county, and a spirit of improvement be awakened among the farmers—let a knowledge of improved farming be generally circulated, and the most approved systems adopted—let Agriculture be elevated to that high rank in the public estimation to which it is justly entitled; and let those who now hang about our cities idle consumers of the public wealth, become industrious producers, and this nation would soon recover from the ruinous effects of profligacy and extravagance—the doleful cry of hard times would cease to be heard, and as we are the most highly favored, we should soon become the most happy and prosperous nation in the world.

From the Yates Co. Whig.

Agricultural Meeting, &c.

At a meeting of Farmers, convened pursuant to public notice at the American Hotel, in Penn-Yan, on the 11th of March, 1840. HENRY SPENCE, of Starkey was called to the chair, and Charles Lee, of Milo, appointed Secretary. The objects of the meeting were then stated by John Hatmaker, upon whose motion it was

Resolved, That the meeting proceed to organize an Agricultural Society, to be auxiliary to the State Society, and to be called the Yates County Agricultural Society.

After some appropriate remarks by the Chairman and several other gentlemen, it was, on motion of D. A. Ogden,

Resolved, That a committee, to consist of one from each town in the county, be appointed, to report a constitution, for an Agricultural Society.

Whereupon, D. A. Ogden, of Milo, Elisha Doubleday, of Italy, Henry Husted, of Potter, George Wagener, of Jerusalem, Joseph McCain, of Barrington, B. Tutill of Starkey, F. Harkness, of Middlesex, and A. F. Whittaker, of Benton, were appointed said committee. On motion, the Chairman of this meeting was added to the committee.

The committee, after a short absence, reported the following constitution, which was adopted.

Constitution.

Sec. 1st., This Society shall be called the Yates County Agricultural Society, Auxiliary to the New York State Agricultural Society; and its object shall be to promote Agriculture, Horticulture, and Household Arts, in Yates County.

Sec. 2nd., Any person may become a member of this society, by paying one dollar to the Treasurer thereof; and he shall thereafter pay one dollar, on or before the 1st day of Sept. of each year, so long as he shall continue a member. Any member may withdraw from this society by giving notice to the recording secretary; and paying all monies due from him the society.

Sec. 3rd. The officers of this society shall consist of a President, 8 Vice Presidents, a Recording and Corresponding Secretary, a Treasurer, and an Executive Committee, of one from each town in the county, those officers to be elected by a majority of votes, at the annual meetings of the society, and to hold for one year, or until others are elected in their place, except the first, who shall be elected immediately, and hold their offices until the first annual meeting.

Sec. 4th. The officers of the society, 5 of whom shall form a quorum, shall constitute a board of managers; it shall be their duty to exercise a general supervision over the affairs of the society—to appropriate the funds of the same, in such manner as shall in their judgement best subserve the interests, and forward the objects of the society,—to call special meetings,—to appoint committees,—to award premiums and determine all matters connected therewith,—to distribute all Seeds, Plants, Books, &c., received for the society,—and to hold the Annual Fair or Exhibition, and make all necessary preparation therefor.

Sec. 5th. The President—in his absence, one of the Vice Presidents—shall preside at all the meetings of the society, and of the Board of Managers.

Sec. 6th. The corresponding secretary shall, under the direction of the Board of Managers, receive and answer all communications addressed to the society, or any of its officers.

Sec. 7th. The recording secretary shall keep a record of the members of the society, and of its proceedings; he shall also be secretary to the Board of Managers, and keep a record of their proceedings, and he shall perform such other duties as the board may from time to time assign him.

Sec. 8th. The Treasurer shall receive all the monies of the society and expend the same only by the direction of the Board of Managers; he shall keep a correct account of the receipts and expenditures, and make a report at each annual meeting of the society, of his affairs as Treasurer; he shall give a bond for the faithful performance of his duties, in such penalty and with such surety as the Board of Managers may require.

Sec. 9th. The Board of Managers shall have power to fill all vacancies in the offices of the society, and the persons thus appointed shall hold their offices until the next annual meeting.

Sec. 10th. No person but such as has been a member of the society for 30 days before any fair or exhibition held by the society, shall compete for premiums.

Sec. 11th. This society shall hold its annual meeting on the 3rd Wednesday of October, in each year, and there shall be, once in each year, at such time and place as the Board of Managers shall direct, a meeting for the exhibition of domestic animals and the agricultural productions of Yates County, and for the awarding of premiums.

Sec. 12th. This constitution may be amended at any annual meeting of the Society, by a vote of two-thirds of the members present.

On motion, it was

Resolved, That the meeting now proceed to elect officers for the society.

The following persons were then elected.

JOHN HATMAKER, of Milo, President.

Vice Presidents—Henry Spence, of Starkey; John Spicer, of Barrington; Henry P. Sartwell, of Milo.

Samuel Wise, of Benton; Henry Husted, of Potter; D. B. Lindsley, of Middlesex; Uriah Hanford, of Jerusalem, and Elisha Doubleday, of Italy.

Executive Committee—Charles Lee, of Milo; Benj. Tutill, of Starkey; A. F. Whittaker, of Benton; George Wagener, of Jerusalem; James P. Robinson, of Potter; Joseph McCain, of Barrington; Alexander Basset, of Middlesex; and Elisha Barker, of Italy.

Corresponding and Recording Secretary, D. A. Ogden, Penn-Yan.

Treasurer—Eben Smith, Penn-Yan.

On motion of D. D. Van Allen, of Starkey, it was *Resolved*, That the persons who shall now become members, and those who join the society previous to the first of September next, be not required to pay their initiation fee of \$1 until that time.

On motion of D. A. Ogden, of Milo,

Resolved, That copies of the proceedings of this meeting, together with the Constitution here adopted, be presented to the papers published in this county, with a request to publish them, and also that they be sent to the *Cultivator and the New Genesee Farmer*, with a similar request.

On motion of A. F. Whittaker, of Benton,

Resolved, That this meeting adjourn, to meet again on Thursday, the 4th of June next, at 2 o'clock P. M.

HENRY SPENCE, Ch'n.

CHA'S. LEE, Secretary.

For the *New Genesee Farmer*.

The Travelling Agent—A Dream.

Messrs. Editors—Some weeks ago, having spent the evening in reading the 2d. No. of your paper, in which you say so much about agents and correspondents, patrons, &c., I went to bed, thinking that, whatever others might do, I would sooner give a dollar for your paper than fifty cents for the "*Cultivator*." As I had already subscribed for the "*Farmer*," and *paid in advance*, my conscience was clear, and, as a natural consequence, sweet slumber,—the working man's friend,—soon transported me into the aerial regions of fancy.

I thought that, on coming home with my wife from an afternoon's visit, we found a man awaiting our return, who, although for my life I could not recollect that I had ever seen him before, seemed overjoyed to see us; and forthwith began to call us his dear friends, to tell us how happy he was when travelling to pass the night at a neat, quiet farmer's house, and particularly at the house of a Christian brother; that he had nothing to do with taverns; as he could not in conscience patronize them whilst they persisted in selling liquor; he was not disposed to cousin his living out of any body,—was as far from being a sponge as any man on earth; but as Christians, real *evangelical*, *experimental* Christians always esteem it a privilege to entertain each other, he had no doubt we would be glad to see him; and moreover, as he wanted me to subscribe for some periodicals, books, &c., he had taken the liberty to put his horse in the barn, bring in his trunks, and await our return.

By this time I recognized him as the man of whom I several years before, had bought some half a doz. big bibles; and my wife, who always sees things sooner than I do, had got the ten-kettle over and some ham and eggs cooking for his supper. At the table he complimented her highly for her skill and taste in culinary matters;—said she had provided for him just such a repast as his circumstances and appetite required, for, in fact, he had had no dinner, and was as hungry as a wolf.—Indeed, said he, I never eat more than twice a day when travelling, unless by chance I happen at an old friend's house about dinner time. My horse too—poor creature—generally gets nothing from morning till night; but then he holds his own very well, for I always give him a peck of oats at night and as much in the morning. Your boys, I suppose, (turning to me,) go to the barn before they go to bed, and I am so tired I believe I won't go out to night.—My wife remarked that, as he travelled so much, she should think his acquaintance with the world would be extensive. O, yes, said he, I have travelled so much and read so much, that I know 'most every body and every thing. I enquired if he brought any news from the city. Yes, said he, glorious news!—great revivals in religion!! I enquired in what churches? He answered in all the churches of the evangelical denominations:—all but the Roman Catholics and Episcopalians; and, indeed, in one Episcopal Church; but their minister was not, in sentiment, an Episcopalian—or Roman Catholic—for he considered them all one. He was the only *evangelical* minister in these denominations which he, in his extensive acquaintance, had ever met with. He said the good man had been frequently solicited to take the office of a bishop;

but his conscience constrained him to decline it; for he well knew that it was a mere figment of popery;—a device of the "man of sin."

Supper being over, he said he would now enter upon business, and forthwith presented me with a subscription list for several periodicals and books, such as the "*Friend of Man*," the "*Advocate of Moral Reform*," the "*Downfall of Babylon*," &c. But his principal object was to obtain subscribers for the "*Cultivator*." This he was the more anxious to do, because, since Mr. Tucker had agreed to transfer the "*Genesee Farmer*" and its patronage to the *Cultivator*, a worthless catch-penny concern had been got up at Rochester, which, as it had neither funds, editor, correspondents, nor any thing else to sustain it, must prove a disgraceful failure.

He next opened his large trunk and displayed his books; consisting of bibles, large and small,—testaments and psalm books,—histories and biographies,—voyages and travels,—dream-books and fortune tellers,—complete letter writers and jovial songsters,—Maria Monk, with plates, and the Horrors of Slavery, with cuts,—Fair Rosamond and the Sorrows of Werter,—Pamela and Clarissa Harlow,—Jack, the Giant Killer, and Tom Thumb, together with many more, too numerous to detail.

While tumbling over these with a great deal of pleasure, my little dog, (a worthless cur: I am determined to shoot him for it,) set up such a barking as to awaken me to the provoking reality that *I had all this time been dreaming!* Yes, dreaming, if you will believe;—nothing on earth but dreaming!!

HOSPITALITY.

Remarks—What amusing images does fancy sometimes place before the mind during its nocturnal reveries! If "*Hospitality*" had not assured us that the above was "all a dream," we should have declared that he was relating an actual occurrence. The lively sketch he has drawn of the "*travelling agent*," bears such a *Strong* resemblance to one of that class who is well known among farmers in this section, that our readers will not fail to perceive the likeness. Should any of our friends chance to receive a visit from this character, we wish they would have the kindness to request him to read one of his "big bibles" a little, before he sells any more of them; as from what we have heard of his assertions respecting the *New Genesee Farmer*, we think he cannot have read any such precepts as, "*Thou shalt not bear false witness against thy neighbor.*"—*Eds. New Genesee Farmer.*

For the *New Genesee Farmer*.

Rules for a Good Neighborhood.

1. If you would enjoy the blessings of a good neighborhood, take care that you furnish your share of the capital stock:—put into the concern *one good neighbor*, and your object is half attained already.

2. Consider that Providence has wisely, (and I may we not say mercifully?) subjected the family of fallen man to a state of mutual dependence. Avoid then the vain chimeras of undertaking to set up that morbid kind of independence which is adapted only to the condition of the misanthrope or the hermit.

3. Keep good fences and orderly cattle. If you have an unruly beast, get rid of him immediately, for your own sake as well as your neighbor's: better kill him and throw him to the dogs than keep him on your farm.

4. Ask of your neighbor such favors, and such only, as (all things considered) appear to be reasonable; avoiding on the one hand a rude annoyance of manner, and on the other a cringing servility. And take good heed that you ask of no one aught which you could not prudently, or would not cheerfully, reciprocate in kind. If you cannot safely underwrite him as security, don't ask his name up in your paper.

5. Refuse no decent man any thing within the bounds of reason; with a real good neighbor go even farther. If you see him in want of any thing which you can conveniently spare, offer it to him:—if his grain is standing in the field after yours is secured, turn in with all your forces and help him. If you, or his team accidentally broken up in the pressing emergency of seed time, cast about and try to get it started again. With such a man (for I am now speaking of "*a real good neighbor*") keep no accounts for "use of harrow $\frac{1}{2}$ day, 3 lbs. mutton lent," &c. When you butcher, send him a piece of meat: never stand about steelyards or memorandum book. If your green peas, cucumbers, or any other vegetables or fruit, chance to be earlier than his, or if his should happen to fall in,

look to it, consider the matter, and do as you would be done by.

6. Should you chance (and very like you may) to have a neighbor, (or rather a *person living near you*), who decidedly prefers borrowing to buying, who, devoid of all shame or decency, is fully bent on spunging his living out of his neighbors, who is determined to sell every thing and buy nothing, who borrows sharp tools and returns dull ones, borrows sound tools and returns broken ones, makes a granary of his neighbor's bags, &c.: even such an one give a fair trial. "Heap coals of fire upon his head." If these don't thaw him out; if you can't by kindness, or any other means, start his bristles, (and it is not probable that you will,) then, frankly, but kindly, tell him his faults; tell him, moreover, that you cannot recognize him as a neighbor; consign him to his kindred spirits for society, and cut his acquaintance.

7. Should you unfortunately, as possibly you may, find your neighbors exclusively made up of such characters as last described, don't wait to be murdered by inches; write "*Farm for Sale*" upon a shingle, nail it on your barn post, take the first offer you get, (for a farm in Sodom can't be worth much,) and "flee for your life."

8. If you have a good-hearted, reasonable neighbor, who, not by his fault, but by sheer misfortune, is unable to furnish himself with all the necessary implements for his business, and who cannot, by reason of his poverty, return you measure for measure, turn not your back upon him because he is poor. Remember you are but a steward, and that to Him "who hath made you to differ" you must give an account of your stewardship. "If you lend only to them of whom you hope to receive what thank have you?"

9. Don't charge your hired man, (if he is a faithful servant,) or your neighbor, on whom you depend for like favors, a few shillings for the hire of a horse or the like; but if your neighboring tradesman or mechanic should have your horse and buggy to go to town, or your team to plough his garden, charge him for it: not, however, because he is a mechanic, but because he is not at the expense to keep such things himself, and can therefore afford to pay for them; and also because he (very properly) charges you for every patch he puts on your shoe, or for every inchpin he puts in your buggy.

10. In all your neighborhood intercourse remember that selfishness is a universal innate depravity; and make reasonable allowance for its influence upon both parties. I will not undertake to impose an arbitrary tariff of duty upon this insidious evil; but will suggest that you allow about 10 per cent. for each party:—e. g. your neighbor says "I have broken your axe, what shall I pay you for it?" Now, if you candidly think the tool was worth 20s., allow 10 per cent. for your own selfishness, i. e. 2s., and as much more for his, and this will give you \$2 for the price of the axe.—Don't say you are not accountable for his selfishness. He may be blind to it, and yet in the main a kind, good-hearted, generous man. Many a man has lost a good neighbor by being "more nice than wise,"—by being, in fact, "penny-wise and pound-foolish."

11. Should the foregoing rules, by reason of their imperfections, fail you as a guide, under peculiar circumstances; or should you meet with any difficulty in applying the principles of them to any particular case; then, (taking care to allow as above directed for selfishness,) change places, in imagination, with your neighbor,—assume his situation in the transaction,—and enquire of your own conscience of what, in view of all the circumstances, you would have reason to expect at his hand, were your circumstances and situations reversed: and as that honest monitor shall adjudge, do you even so:—for "all things whatsoever ye would that men should do to you, do ye even so to them; for this is the law and the prophets."

A Young Devon Bull for Sale.

Messrs. Editors—If any of your numerous readers wish to purchase a full blooded Devonshire Bull, please inform them that E. P. Beck, of Sheldon, Genesee County, two miles S. W. of Varysburg, has an excellent yearling one for sale. It is of a bright red color, and but little, if any inferior in size to the improved Darhams. Those who imagine the Devons to be diminutive, would do well to call and see Mr. Beck's stock of that breed. Respectfully yours,

W. GARUTT

Grinding Corn in the Cob.

We commend the following communication from Dr. A. H. Tyson, published in the American Farmer of Jan. 8, to the attention of our readers, and would recommend, in addition to crushing the corn in the cob, to have it thoroughly ground into meal, as we have found, from our own experience, a very decided advantage from this mode of feeding it even to domestic animals, and are fully satisfied that it is not overestimated. It is almost universal among our farmers to feed corn to fattening hogs in the ear; but experiment has satisfied us, that a given quantity of corn, ground in the cob, will accomplish as much as twice the quantity fed in the ear, provided that the meal is fermented by a mixture for a few days with water. A cast-iron crusher is attached to a mill in the neighborhood, and the expense of the operation very trifling.

The Virginia Corn and Cob Crusher.

MR. SKINNER—Your notice in the Farmer of the 15th inst. of what we esteem one of the most valuable agricultural machines within our knowledge, has induced us to add our experience of two years in feeding work horses. Previous to the purchase of the Crusher, we averaged 214 ears of corn. Our stock then and now average seven head. One hundred and sixty ears of the ordinary size are now run through the crusher—they make 2½ heaping bushels of crushed corn and cob. The different appearance of the horses, and their better ability to work, prove beyond a doubt, that the crusher affords a more nutritious and healthy food. It will be seen that it also places to our daily credit, 54 ears of corn, upwards of 30 barrels a year, worth, at the average Baltimore price, nearly double the cost of the crusher. You state that two men can do tolerable work with it. Our experience would say you are mistaken, unless you mean to select two of your stout-hearted and strong-handed Kentucky friends; then, of course, we knock under. With four men to turn, and a boy to feed, from 4 to 5 bushels per hour can be crushed. To work the machine essentially and economically, it must have velocity, which cannot readily be effected by manual power.—With a two horse power, a man to feed, and a boy to drive, 13 bushels of corn and cob can be crushed in one hour. The crusher in question came from the manufactory of R. Sinclair, Jr. & Co. During the two years we have had it in use, and quite roughly, it has not cost one cent for repair, and is now in as good order as when purchased. The workmanship and material fairly considered, the machine is certainly not dear at \$35. We have seen \$150 given for a horse-power with about the same quantity of material as the crusher, but not half the workmanship. If mechanics would, as they certainly can, afford their work for less than their present prices, their increased sales would make them, equally with the farmer, the gainer by it. From the many evidences of the nutrient contained in the corn cob, the experiment by distillation, of Mr. Minor, of Virginia, is decisive.—(See American Farmer, Vol I, p. 321.) Mr. M. found 5 bushels of cob yielded 4 gallons of spirit.—He also found other nutritive matter than the saccharine which is converted into alcohol, as mangel and oats.

Your friend,
A. H. T.
Baltimore Co., Dec. 22, 1839.

Ditching and Banking Machine.

The following is an extract from an editorial article in a late number of the American Farmer. The machine spoken of would be of great value upon alluvial land; not annually overflowed; and even on these, might, in many cases, be highly advantageous. When it is recollected that many thousand acres of low grounds, even in Western New York, are now nearly useless, and which might be rendered productive in an extraordinary degree by thorough draining, the importance of such a machine will be evident. The inventor states, in the same paper, that it "has been in successful operation more than one year, and that more than twenty miles of ditch has been cut with one man and a horse, in the best season, by one man and one horse;" and that one for two or four horses will cost about 75 or \$100.

"Among others, we have various threshing machines, corn-crushers, corn-crushers, reaping machines, mangle, tobacco press, and others, now get-

ting into general use. The machine mentioned at the head of this article, is not yet so generally known—it is of more recent invention, and being costly, must make its way slowly—at the same time it must be admitted, that no object is of more importance, than the one which it is designed to accomplish. How many thousands of acres of lands have we, even in Maryland, too flat to be drained with the plough—yet every one knows that thorough draining is indispensable to good husbandry—Surplus moisture is as destructive to all sorts of crops, as a proper degree of it is necessary to their growth—yet what agricultural process is so expensive as thorough ditching by manual labor?—And then it should be borne in mind that the lands which lie waste, and are lost, for want of draining, are by far the most fertile of the state—such as are not only the richest, but the most inexhaustible. And, again—there is nothing in the wants of the farmer, so conspicuous and of such universal prevalence, as the want of hay! The lands that require draining, being once well cleaned and ditched, would yield perennial crops of hay, without the expense of frequent cultivation—another consideration this to show, that ditching, if it can be done, within any reasonable bounds, is, in fact, economical, although costly in the beginning. To make annual crops requires annual ploughing over the whole surface; whereas, a single ditch may reclaim, without further cost or cultivation, many crops, in successive years, from a great number of acres, without any further expense than that of cutting and caving. These considerations are suggested to show the importance of ditching in itself, and of all inventions to reduce the cost of it; and such is the invention of Mr. Page for ditching by horse-power.

The work done by it is beautiful and mathematically exact—The machine is calculated to be most valuable in the Prairies of the West, as it is designed to drain and inclose at the same time. The farmer may open one ditch, depositing the earth close along the line of it, or, if he please, he can make two ditches (not at the same operation) embanking the earth between the two.

The machine is worked by one horse, and a man and boy—To any one desiring to see a drawing of the machine, and applying by a *post paid* letter, we can send one, though it is not of a kind to illustrate the subject. In the conclusion of his description, the inventor observes, "The above machine, when in complete operation, will cut and finish in soft alluvial soil, twenty inches per minute, or in hard clay soil, from ten to twelve per minute, a ditch of the following dimensions: three to four feet wide at top, eighteen inches at bottom, and three feet deep."

We hope to be able soon to speak more positively, and from a better and more practical knowledge of the machine—For the present, we submit the following letter, from a gentleman whose use of it has been very extensive, and, as it seems, altogether satisfactory:—

Baltimore, Jan. 18th, 1840.

MR. GEORGE PAGE—Sir—I take pleasure in stating that I have extensively used the Ditching and Banking Machine purchased from you some time since, and find it to answer in every respect, the purpose required; and will freely say that it is far superior to any thing now in use. I have had it in operation on my plantation, and have cut at least three miles of ditch—I think there is no hazard in asserting that it will save the labor of at least ten men.

JOHN B. STEENBERGER.

From the Rochester Seed Store Catalogue.

Sowing Seeds, and Causes of Failure.

Much of the complaint which is made of the failure of seeds, is owing to the want of proper care in sowing them, or to other circumstances than their bad quality. Many kinds of seeds are very small, and if these have more than a slight covering of earth, they will not vegetate. And, on the other hand, when slightly covered, one or two days of hot sun will dry the earth, so that if they have sprouted they will be inevitably destroyed. Some kinds of small seeds will not vegetate well unless the earth is rolled or pressed firmly in contact with them. (Thus it will be seen that small seeds should be sown in fine earth, covered lightly, and rolled or pressed down; and the bed should then be shaded from hot sun and watered frequently in dry weather.) Some seeds have a hard shell or pericarp, and require several days soaking before sowing, in order to cause them to vegetate freely. If these are sown without any preparation, and dry weather ensues, they will invariably fail. Other kinds, natives of warm climates, will be sure to rot if sown when the weather is cool and moist; and some even require a good hot-bed to cause them to vegetate. On the other hand some kinds, require cool moist weather,

and will not grow if sown late, when the weather is hot and dry. Again, sometimes the seeds vegetate well, but before the plants have become fairly visible, they are destroyed by the myriads of insects which often infest the ground in summer. These are a few of the many causes which every experienced gardener knows frequently prevent the growth of seeds; but the failure of which is often attributed to their bad quality.

The proprietor of the Rochester Seed Store does not pretend that his seeds are never at fault; on the contrary, he is fully aware, that notwithstanding all his care to avoid it, there has, in some cases, been just cause of complaint. And although he intends to use greater precaution hereafter, he cannot hope or expect but that mistakes will sometimes occur. All he can say is, he will do the best he can to give satisfaction; and he hopes that any person who may have any articles from his establishment, which do not prove good, will inform him of the circumstances, in order that restitution may be made.

Soaking Seeds.

Nearly all kinds of seeds will vegetate sooner and more freely, if well soaked before sowing; particularly if the seed be of a hard dry nature, or the weather at all dry. The frequent complaints which are made of the failure of Mangel Wurtzel and Sugar Beet seeds, usually arise from a neglect of this preparation. The most extensive and successful cultivators of these roots, always soak the seeds three or four days before sowing.

Rolling Seeds.

The rolling or pressing down of seed beds after sowing is too often neglected, although very necessary in some cases. Most seeds are very small things, and when sown on a loose soil it frequently happens that many of them are not in close enough contact with the earth, to be kept moist and excluded from the light; consequently they will not vegetate freely, if at all, and the young plants, if any, easily dry up and perish.

From the New England Farmer.

Education of Farmers.

MR. BRECK—In your notice in the New England Farmer, of the highly cultivated and productive farm of that very useful and distinguished gentleman, E. Phinney, Esq., of Lexington, you remark that his attention was first called to the subject of agriculture by reading the New England Farmer, and that at his establishment you realized all you had expected to see, where the science of agriculture, guided by the hands of learning and practical skill, was brought to the aid of practical farming.

This recurred to my mind a subject of vast moment, not only to the agricultural interests of the United States, but to every interest and craft into which human society is subdivided; I mean a radical defect in our whole system of education, from the common school upward to the final graduation at our colleges, during the whole of which important period of human life, the attention, the tastes, the sympathies of the educated class are systematically diverted and estranged from the subject of agriculture and the pursuits of the great mass of our people, as if an evil spirit rather than a good and beautiful God, had first assigned to man the cultivation of the earth as his highest and noblest pursuit—as if to keep up the humiliating importance of the learned professions, as if the statesman, the scholar, the lawyer, and divine, need know nothing or care nothing about agriculture—the pursuit, perhaps, of sixteen twentieths of our population, and by which all classes "live and move and have their being;" as if natural wealth, independence, happiness, and morality, had nothing to do with the increased products of the earth.

Now, sir, how comes it to pass in this boasted republic, of almost boundless extent, of every variety of climate, soil, and production, that the principle of equality is entirely reversed—that which is showy takes the precedence of that which is substantial—that he who lives by professional quackery, the honest chicaneries of trade or gambling speculation, is admitted by common consent to a higher rank in the public estimation than the farmer? I answer, our system of education lays permanently at the foundation of this very state of things. Admit the science and art of agriculture to an equal importance in our institutions of learning with chemistry, architecture, law, and theology; let it be considered one of the sister sciences, and let stated lectures be delivered to our young men during the period of their collegiate education, on the science of agriculture as on chemistry, comparative anatomy or oriental literature, and a new day would dawn on the agriculture of the country and the condi-

tion of the husbandman. When these young men go forth through the length and breadth of the land, to exert that influence upon society, which belongs alone to education and intelligence, to direct public sentiment, make laws and rule the land, in the walks of private life, in the halls of legislation, agriculture would find warm and hearty friends, and staunch and bold advocates in the learned class, and grants and aid from the States would be as common to agriculture as they have been to learning, law, medicine, or theology; and the now unheard-of donations for agricultural learning, would become as common, and more honorable and useful than the foundation of professorships of Greek, Latin, oriental, or polite literature.

Is not agriculture as much a science as law, medicine, theology, or moral philosophy? Is there not as much in agriculture to form a good, useful, and virtuous character in our young men, as in the discussion and lectures on mere abstract morals or modern literature.

Had our legislators of the present day enjoyed the benefit of agricultural lectures in the course of their education, and been made early in life to realize the importance of agriculture as the true source of national wealth and independence, can you believe for a moment that by a partial system of legislation, predicated on the superior claims of commerce, the mechanic arts, and manufactures to state and national encouragement, they would have made the country dependent on the monarchies and despotisms of Europe for the supply of their daily bread? Is not our republic, by the annual importation of from 15 to \$20,000,000 of bread stuffs, reduced to the condition of a farmer spending annually more than his income, and in case of foreign war, unbalanced and diverted from its true and natural channel, as the industry of the country now is, must not famine and distress invade many portions of our now glorious and happy country?

It is said by some that the idea of an agricultural professorship is Utopian and visionary. Other countries have found it necessary to enlist learning on the side of agriculture. In despotic Russia, in the colleges at Petersburg and Moscow, are agricultural professors at the expense of government, and in the common schools and colleges in Prussia, agriculture is a part of the regular course of studies: In the German states, in France and Scotland, similar attention is given to agriculture.

Now, we have public spirited men among us with untold thousands, designed at last for some public benefaction, to perpetuate the usefulness and beneficence of its present owners, after they shall have passed from the scenes of this mortal life to the rewards of the just made perfect. Now what object to such men can be presented, with higher claims to their beneficence, than agricultural education?

Very respectfully, your ob't serv't.
H. C. MERIAM.

Usefulness of Birds and Toads.

Mr. Editor—I see it stated in your paper of Friday, that the probable reason why the canker-worm commits small ravages in 'Flob,' is found in the care with which the birds are protected. I was reminded of a remark in Peabody's Life of Wilson. "He enters into a deliberate calculation of the value of the services of the red-winged blackbird, which certainly bears no good reputation on the farm; showing that, allowing a single bird fifty insects in a day, which would be short allowance, a single pair would consume 12,000 in four months; and if there are a million of pairs of these birds in the United States, the amount of insects is less by twelve thousand millions, than if the red-wing were exterminated." Let any one, during the brooding season of robins or other birds, rise by break of day and count the number of times old ones return in one hour with worms and insects, or, if he can, let him count through the day, and the number will be found almost incredible.

The practice of killing birds for mere amusement, is not merely indicative of cruelty and want of feeling, but is exceedingly detrimental to the interests of the community. If the farmers reflected and made calculations upon the subject, they would discourage and oppose it as one of the greatest scourges, and would pay a premium to their boys to let the birds alone, rather than furnish them with powder and shot to kill them.

And, now that I am upon the subject of insects and worms, let me add, that there is a very unreasonable prejudice against toads. They are exceedingly valuable in gardens, and other places, in consequence of the exterminating warfare they are continually waging against the bugs and worms. Any person who has them in his garden has a treasure there; and if he will watch them closely; he will find them accomplishing

more in the way of preserving his squash and cucumber vines, and other vegetables, than he can do with all his troughs of liquid. I think these subjects will be brought more fully into notice by the gentlemen commissioned by the state to examine into its Natural History; indeed I know that one of them, at least, has been at great pains for two years, to collect from all parts of the country what information he could upon the subject, which would be likely to secure the farmer from the ravages which his trees, his grain crops, and all the products of his farm suffer from insects and other causes. I would suggest that this subject be brought up at the weekly agricultural meetings, and that persons acquainted with these matters be invited to communicate their information upon them. For, notwithstanding all the outcry about retrenchment, and useless offices, it seems to me that no offices in the end are likely to be more valuable to us, than those which will bring to light the hidden resources of this state, and collect all the information, both scientific and practical, which will secure to the agricultural population relief from every thing which blights and diminishes their crops.

S. Y.

Boston Courier.

From the Farmers' Cabinet.

Small Comforts.

Women's work is never done, therefore you ought to lend a hand.

The Cabinet, and other agricultural periodicals, have made our men folks very learned on the subjects of manures, crops, short-horned cattle, sheep, swine, &c. We hear them often discussing these topics, and they really appear to derive benefit from it, for they seem to talk less of politics, and other everlasting subjects about which they never could come to any satisfactory conclusion, since agricultural papers have been generally introduced into our neighborhood. But there are some matters that we women folks, who constitute a part, and we think no unimportant part of the agricultural community, are desirous should claim a share of the attention of the Editor of the Cabinet; just give us a page or two of your useful journal every month, in which to discuss such subjects as may more particularly appertain to our department of the duties of house-wifery as connected with agricultural life.

If you will agree to furnish us with the use of a chimney corner of the Cabinet for our *own* use, we will accept it with thanks; if not, we will have a paper of our *own*, for our *own* use, edited by one of our *own* number, and then look out and stand clear when the hot-water begins to fly about your ears.

I will now tell you some of the matters we want brought before the public, with the view of meliorating our condition, and promoting the interest and comfort of all concerned. You may call these small comforts, but of small things great ones are composed; grains of sand make mountains, drops of water constitute the ocean, and little babies make men and women all the world over; no exception, Mr. Editor. The great matters of agriculture are ably and amply discussed in your journal, but we want something said about our own wants and wishes. A year or two ago you published a very good essay about a "wood-house," for the comfort and convenience of females; it was much talked of, and every man in our neighborhood, except an old bachelor, approved of it, and most of the men said they would build a receptacle for keeping the fuel dry forthwith; one even went so far as to get the stuff for it, but afterwards used it for another purpose, and to this day there has not been built a wood-house in our township; so we have to burn wet wood, and go out in the rain and snow to get it; sometimes the breakfast or dinner is delayed beyond the usual time in consequence of the fuel being wet and green, and whenever this happens, we are sure to hear of it in the way of complaint, although the fault lays precisely where the complaint comes from. Baking, you know, can't be done right without dry wood, so we want you to write another essay about keeping wood in the dry, and having it cut and split to proper sizes for current family use. Many of us in our neighborhood are bad off for water, and the men don't take it to heart as they ought to, or things would soon begin to mend. Carrying water a long distance is real work, and so is drawing it from the bottom of a deep well, and a tall pump don't work easy. A few of our neighbors have good large cisterns with pumps in them that save much time and labor; and besides, the fine soft rain water they contain is so good for washing, that I wish you would give us a hit in the Cabinet, so that every family may be furnished with one, even if it should be thought to be for our sakes alone. Now there is the milking, which you know must be done, rain or shine, no matter how great the storm, or deep the mud or filth of the path, or barn

yard, or stable; try to help us along a little in this important matter: the path might be paved, or gravelled, one would think, without much expense or labor; and the stables, can't you teach our *dear masters* how they, as well the cows, can be kept clean during the winter season. It is said cows give much more milk when they are kept tidy and clean, I think it stands to reason that they should. If I was a cow I wouldn't give a drop of milk unless I was kept neat and clean, and well fed in the bargain, for I hate these lazy, stung fellows, that are always trying to cheat and get something for nothing; do give them a touch on these subjects, and if you do it handsomely, I will write to you again, and tell you a few more of our grievances, under which we have long been laboring to our great discomfort, and the great injury of our constitutions.

SUSAN.

*We invite "Susan" to occupy a place in our columns every month; and would extend our invitation to other ladies, who sustain the enviable relation of wives and daughters to the true nobility of the country, to take "Susan's" communication, or their own experience for a text book, and forward to us their productions. We pledge more than the number of pages for which "Susan" asks, and should there be any want of room, we will publish an occasional extra, as a less evil than that of being subjected to a sprinkling of "hot water," or entering into competition with our *fair friends*.—*Eds. New Genesee Farmer.*

Poor man! no wonder that he surrenders the use of his columns to his "*fair friends*." Who would have expected to hear such warlike threatenings from the descendants of the peaceful Wm. Pess, and utter them towards an editor in the city of "brotherly love"? Our fair readers employ more gentle means, and by the force of kind persuasion, induce us to offer them the same privilege—the free use of our columns for their own benefit.—*Eds. New Genesee Farmer.*

To Spice Beef—Irish Fashion.—Suppose your round to weigh 55 lbs.; take 1½ ounces of saltpetre, 2 table-spoonful of brown sugar—pound them both very fine, and rub your beef remarkably well—put it into a tub as near the size as you can, and let it remain 48 hours—during which time turn and rub it two or three times—then have prepared ½ ounce ground pepper, 5 ounces alspice, 1 ounce cloves, and three or four handful of salt, all ground and mixed well together, with which rub your beef well, and for a week after turn and rub it every day, taking care to preserve the pickle. It will be ready for use in two or three weeks, according to the weather.

To dress it.—Chop about one pound of fresh suet, place a few sticks at the bottom of your pot to preserve the beef from burning—lay it on them and throw the suet over it as well as the pickle—pour in about two quarts of water at the side of the pot, cover it very close, and let it stew very slow till done.

The same.—Boil some carrots and turnips, chop them fine, make some thin drawn butter, season it with some of the liquor that is about the beef, garnish your beef with the carrots and turnips, and send your sauce in boats to the table.—*Am. Far.*

Beware of Short Collars.—Mr. HOLMES.—On Saturday afternoon last, a man put up at my house, who had a sick horse. The horse did not appear to be in much pain, but would not eat any thing; he had been travelling in a team, perhaps 70 miles. On Monday afternoon the horse died very suddenly. He was standing in the stall, and as I supposed was about to lie down. I went out at the great door and in at the stable door as soon as I could, and found him dead.—He must have died without a struggle. The owner engaged one of my horses to complete his journey.—On harnessing, I observed that the collar which the sick horse had worn was too small, and objected to its being put on my horse. It was shifted and put on the other horse.

On making a *post mortem* examination of the dead horse, I found that the breast on the inside, and the lower part of the shoulder appeared to be much affected, as were also the lungs, a quarter part being turned black, with the appearance of great internal inflammation. There was no other appearance of disease or injury to be found in him, and from this I am led to infer that his death occurred in consequence of his wearing the small collar—nothing more. This should lead owners to beware, and know that their collars are sufficiently large, and they may perhaps prevent much loss to owners, and much needless suffering to that useful animal—the horse.

Wm. Thompson, Jan. 18, 1840.

J. W. LAMB.

Maine Far.

To Preserve Eggs.—Apply with a brush a solution of gum Arabic to the shells, or immerse them therein—let them dry, and afterwards pack them in dry charcoal dust. This prevents them being affected by any change of temperature.

Farmers' Daughters.

We have received another excellent letter from our fair niece, ANNETTE; but unfortunately it did not arrive until the end of the month, when our pages were full. We wish A. would not wait to send her letters "by a friend," hereafter, but trust them to Uncle Sam. We are aware that he is rather slow these times, but he is pretty sure and we will gladly pay his fee for such letters.

Our female friends will perceive that we have not forgotten them this month, and we hope we never shall; but for fear that a multiplicity of business should drive them from our thoughts, we advise them to write more frequently.

DEATH OF JOHN LOWELL.—A late number of the New England Farmer contains the announcement of the death of John Lowell, Esq., of Roxbury, Mass., distinguished during a long life, for his talents and eminent services in civil society, and more especially, in the improvement of agriculture and horticulture, and their kindred sciences.

EARLY ASPARAGUS.—The first premium this Spring, for early Vegetables, was awarded to James Lennen, for two bunches of Asparagus, raised by him in the garden of Dr. Kelsey, and delivered at the Rochester Seed Store the 27th of March.

Names of Grasses--A Correction.

Much confusion often arises from the circumstance that the common names of many grasses (and other plants) are entirely different in different sections of country. Thus June Grass, Red Top and Herds Grass, are terms sometimes applied to various species, and it is often impossible to decide what particular plants are intended to be designated, unless the true botanic names are given; and as these are not known by farmers generally, it is easy to account for any mistakes which may be made on this subject.

We committed an error of this kind ourselves, on P. 36 in our last number, which our readers will please to correct. We called June Grass, *Agrostis Vulgaris*—it is *Poa Pratensis*. We called Red Top *Agrostis Stricta*—it is *Agrostis Vulgaris*.

The number of species of grasses found in this section is over one hundred. We intend to form a complete collection of dried specimens next summer, and have them correctly labelled and arranged for the proposed Agricultural Museum, in connection with the Rochester Seed Store.

The Agricultural Museum.

The proposition for forming an Agricultural Museum as mentioned in our first number, appears to receive universal approbation; and a number of our friends have promised to contribute something towards it.—Any appropriate donations will be most thankfully received and duly acknowledged. It is not expected that much can be done towards it, until after harvest.

Horse Medicine--Quackery.

We have received by mail an anonymous letter requesting us "to introduce to the acquaintance of our readers, a medicine for horses," which is prepared by one G. W. Merchant, and for sale (not sold, we presume) "by most of the Druggists in the country."

We know nothing about this medicine; but we do know that *it was taxed with the postage* on the letter, and we think it best to give our readers some benefit from it. We therefore caution them, one and all, as they value their money and the health of their horses, *not to have any thing to do with this medicine*; for we feel well convinced that it is all quackery and imposition. Valuable medicines, like honest men, do not require such measures to be taken to obtain public favor.

SHEPHERDS' DOGS.

PUPPIES, of the true breed of Scotch Collies, may be had on application to Wm. Blaikie, Hamilton, T. C.—Price Five Dollars each, at six weeks old, delivered at his farm; or six dollars if sent by Steamboat or stage.

A remittance will ensure a puppy of the first ensuing litter, being sent as ordered.

Wm. BLAIKIE.

Hamilton, T. C. March 20, 1840.

MANY ornamental Shrubs and beautiful flowering Plants, a large lot to the peculiarities of this region, may be had at very moderate prices by applying to

DAVID THOMAS.

Near Aurora, Cayuga Co.

Letters, post paid, and enclosing remittances, will receive due attention.

Boxes or barrels forwarded by the Canal.

Also for sale, 8 or 10 fine sorts of Peas, grafted from bearing trees, and a few other fruit trees.

4th mo., 1840.

SILK WORM EGGS.

THE subscriber has on hand a quantity of the Mammoth Sulphur variety of Silk-worm Eggs, in fine order, which he will sell at reasonable prices. Residence, corner of High and Spring-streets.

THEODORE BAUCUS.

P. O. No. 1, March 31, 1840.

ARNOLD'S IMPROVED PORTABLE HORSE POWER.

THOSE who are interested in the use of HORSE POWER MACHINES, for Thrashing, Sawing, or other mechanical purposes, and who wish to avail themselves of the most approved article, may find it greatly to their advantage to read the following notice:—

I have devoted more than ten years exclusively to the study of Horse Powers, and expended over twenty thousand dollars in experimenting, with a fixed determination to furnish the public with a Horse Power that should not only excel all others, but meet the wants of an industrious and enterprising people. Thus far my efforts have been directed to the construction of a machine for ONE OR TWO HORSES, that would secure ample power for all ordinary purposes, and at the same time be portable, cheap and durable.— And after putting in operation a greater variety of Horse Powers than all hitherto known by the public, I have at length discovered a principle which I am confident must become the standing one for the construction of Horse Powers, for ages. It is secured to me by Letters Patent, and I have, during the past year, made and sold a large number of the machines, which have been applied to a variety of mechanical purposes—affording me every facility for testing its usefulness. And although we were unfortunate in our first attempts at thrashing, having to contend with a thrasher that proved to be literally good for nothing, it is now used with greater success, and its claim to superiority fully established beyond all controversy. But, until now, I have not been ready to introduce it to the public through the medium of the press, though some of its friends have taken this method to invite the attention of the community to its merits.

Experience has suggested some alterations and improvements in the machine, not affecting its general principle, which it may be necessary here to notice.

The flooring for the horse consisted of ten cast iron plates, entirely disconnected, lying upon friction rollers and passing from end to end of the machine, by means of a small gear wheel and guides, without changing the surface. Here were two important objections that we have fully overcome. The guides were in separate pieces and liable to get loose, thereby causing disorder. This difficulty is obviated by casting the guides and boxes all in one. Again, the gear wheel played through the centre of the plates, exposing them to dirt from the horse, and danger from a loose shoe or other hard substance that might accidentally get upon the plates and pass under the wheel. This is fully remedied by removing the gear wheel to the side of the plates, where they are out of sight and danger.

Some objections were also made to iron for the horse to walk on; the plates or treads are now so constructed, that a durable wood floor is easily fitted, at a trifling expense. In short, the machine is so perfected, that nothing is wanted to render it the most desirable HORSE POWER, that can be found in any country; and I am ready to warrant all that I may sell, either for one or two horses, and bind myself to refund the money in all cases where they do not fully answer the contract.

Two thrashers have been constructed to accompany the Horse Power, one over and the other under-shot, either of which give universal satisfaction.

Certificates relating to the utility of the Horse Power, or any information desired, may be had on applying to the subscriber. But the machine in all cases, is its best recommendation. The Right for a large amount of territory has already been sold, and the whole country will soon be able to judge of its merits.

All communications addressed to me, Post paid, will receive due attention.

WILLIAM E. ARNOLD.

N. B. Those who wish to avail themselves of Mr. Arnold's improvement in the States of New Hampshire, Vermont, or Missouri; or in the counties of York, Cumberland, or Oxford in the State of Maine; or in the counties of Albany, Rensselaer, or Green, in the State of New York; or Madison county in Illinois; may apply to Dr. Moses Long, of Rochester, N. Y., as the exclusive agent for those districts. Dr. L. is also interested in the manufacture of Horse Power Machines, and sales of patent rights in thirteen other States, and in twenty-one other counties in New York.

Rochester, April, 1840.

A PARTNER WANTED.

AN Experienced Nurseryman, who has already a good Green House and Young Nursery, where there is an excellent chance for an extensive business, wishes to form a partnership with some person who can invest a few hundred dollars to increase the concern, and who would be willing to devote his attention to the business.

Enquire at the Rochester Seed Store.

April 1, 1840.

SILK WORM EGGS.

A VERY large quantity of Silk Worm Eggs, of the Mammoth Sulphur, and other varieties, are for sale at the Seed Store, at reduced prices.

N. B. "Dennis" Silk Manual, Price 25 cents, also for sale.

April 1, 1840.

SITUATIONS WANTED by several Gardeners.

Enquire at the Seed Store.

April 1, 1840.

GENUINE ROHAN POTATOES.

A FRESH supply, warranted genuine, received at the Seed Store—Price \$2 per bushel—\$5 per barrel. A remittance will ensure their being sent according to instructions; and if a large quantity is desired, a reduction will be made.

M. B. BATEHAM.

DURHAM CATTLE.

THE subscriber offers for sale, at his stock farm, one mile east of the village of Alexander, Genesee County, thirteen one and two year old Bulls, ranging from five to seven eighths blood, raised from his full blooded Durham importation of 1841, crossed with the Old and Devonshire breeds. Terms moderate.

March 31, 1840.

PETER A. BEAMEN.

CARTIAGE NURSERY.

ROHAN POTATOES.—The subscriber has for sale this most prolific and excellent potato, which he will put up to order, either in small or large quantities, together with other kinds of first rate table potatoes. Also, as usual, Fruit Trees, of the most approved kinds, and a Grape Vine of celebrated varieties. All of which will be sold at prices suited to the times.

N. B. 100,000 Silk Worm Eggs for Sale. Address, through the Rochester Post Office, to H. N. LANGWORTHY. Irondequoit, 3 miles north of Rochester.

March 31.

Millet and Hemp Seed Wanted at the Rochester Seed Store.

Fresh Lucerne Seed, imported last fall, and its vitality tested this Spring, for sale at the Seed Store. Price, 3 1/2 cents per pound.

REMARKS.—The Rochester Market is at present in a very unsatisfied state,—spring business and navigation not yet commenced. The roads are very bad—the times are bad, and the people feel bad—prices are low, and purchasers are scarce—because money is scarce.

During the past month, the price of wheat declined; but the latest news from England has again revived it a little, and it is now expected to advance. Purchasers from Canada have come into this and the Western States, and are buying wheat for the Canadian and English markets; but there is little competition, and high prices must not be expected.

Owing to the bad state of the roads, some kinds of produce are in good demand; but business generally is very dull and unprofitable so until after navigation opens, when we shall certainly see more activity. If not better times.

* * * Publishers of Newspapers in the several counties adjoining Monroe, are requested to give the above one or two insertions.
Rochester, May 1, 1840.

Gardening for May.

Many persons in this latitude do not commence planting or sowing their garden before the first of May; but it is an advantage to sow some kinds of vegetables earlier, as directed last month. Those who have not yet performed the work there specified, should do it without delay. The weather during the past month, has been very favorable for gardening, and vegetation is more forward than usual—the 1st of May. It must not be forgotten, however, that *Jack Frost* has not yet paid his farewell visit for the season, and that it is not safe to plant tender articles in the ground before the 10th or 15th of the month.

Asparagus beds, when new ones are wanted, should be made as early as can be. Deep rich warm soil is to be preferred—mix in plenty of manure, to the depth of two feet, and set the plants one foot apart. If seed is to be sown it had better be done on a small bed or border of rich earth, where the plants can easily be kept clear of weeds. Transplant when one year old.

Beans.—The early kinds may be planted early in the month, and the late kinds about the 10th or 15th. The *Lima Beans* require a warm, sandy soil, and should not be sown during wet or cold weather, as they are liable to rot.

Beets, Carrots, Parsnips, Onions, &c. may now be sown for the main crop. Those sown last month should be thinned out as soon as the plants will per-

mit. Stir the ground frequently, and be careful to keep it clear from weeds—now is the time to kill them easily, and a few days' neglect may spoil the crop.

Broccoli, Cauliflower, and Cabbage plants, raised in hot-beds, if of sufficient size, should be transplanted into the open ground early in the month. Take them up carefully, and immediately immerse the roots in mud, to prevent their drying: this renders it unnecessary to defer the operation till a rainy day. The early York and other small cabbages, need not be set more than half the distance apart of the Drumhead and the Cauliflower. These ought to be three feet apart, and on very rich land. The *purple Cape Broccoli* is an excellent vegetable, and easily raised. Tho seed may be sown in the open ground; early in May, and if the soil and cultivation are good, they will head finely in autumn.

Cauliflower seed may also be sown in the open ground early this month; and if a favorable season, it will do well.

Celery, if sown early in a hot-bed, will now need to be transplanted in a nursery bed, where it can gain size and strength, and be fit for setting in trenches next month. Set the plants four inches apart and water frequently. Shade from hot sun till rooted.

Tomato, Egg Plant, and Pepper, should be removed from the hot-bed about the middle of the month. If the plants are getting large, they may be removed earlier, but must be protected during cold and frosty nights. Egg Plants and Peppers require rich land; but a light, sandy soil is best for Tomatoes—if it is rich and moist they run too much to vine, and do not bear well.

Turnips.—Sow a little of the early White Flat Dutch Turnip, as soon as may be, and if the soil is free from worms they will do well. Sow again the latter part of the month.

Radishes may be sown now, and repeatedly during spring and summer.

Lettuce should also be sown often. Transplant some of the earliest sown, in order to have fine large heads for summer.

Peas.—Sow Marrowfat, and other large kinds repeatedly, during this and next month.

Indian Corn.—Plant some of the early golden variety as soon as possible—if it escapes the frost, all is well. Plant some Tuscarora and Sweet Corn as early as danger from frost will permit; and again about the last of the month.

Melons, Cucumbers, and Squashes.—Plant early in the month, for early use, and about the 15th for the main crop. If planted on highly manured ridges or mounds, they will bear much better than in the ordinary way, especially if the ground be cold and heavy.

Flower Seeds may now be sown in the open ground. Those forwarded in hot-beds should be transplanted about the middle of the month. (For remarks on Sowing, &c., see April number.)

Watering.—Do not neglect watering in dry weather—it should be done in the evening, so that the water may sink in and not dry up.

Shading.—When plants are removed in sunny weather, it is of great advantage to place a shingle or some such thing, on the south side of the plant, to shade it from the mid-day sun. Severe winds are also injurious to tender plants.

Destroy weeds while young, or they will get the upper hand, and be apt to keep it during the summer.

FARMERS' MEETING AT ROCHESTER.

To the Farmers of Monroe, and the adjoining Counties:—

A meeting of farmers and the friends of Agriculture, in Monroe, and the adjoining counties, will be held at the Court House, in the city of Rochester, on Thursday, the 28th inst., at 10 o'clock, A. M., for the purpose of considering the present condition of agriculture and the farming interests in this section of country, and for devising means for their improvement. The good which has resulted from Agricultural Societies in other places, it is thought, affords strong reason for the belief that an association can be formed here, which will elevate and improve our agriculture—give a new impulse to the prosperity of Western New-York—and render the business of the farmer more *pleasant* as well as more *profitable*. This subject has been discussed at some length in the "New Genesee Farmer," and many have expressed a desire that an association should be formed without delay; or at least that a meeting should be held for an interchange of views respecting it.

We, therefore, whose names are hereunto attached,

Cutting Clover, &c.--By Wm. Garbutt.

Messrs. Editors.—In my remarks on *Grasses and Clover* in your 3d number, I find there is an idea conveyed which was not intended, owing to my error, or your's, or the printer's. It says that the small kind of clover "should be mown early, and it may be cut a second time in October, or it will afford good pasture in autumn. This is an advantage to those who have time to make hay before harvest." Thus it would be inferred that I usually cut the large kind after harvest, which is not the case, for it should be cut in July; and last year was the first time that I have cut it so late as August. It is my present impression, however, that it would be a good plan for us to pasture a part of our large clover pretty late in the spring, and then cut it for hay after the bustle of harvest is over.

But the idea I meant to convey is this:—When the soil is moist, or the season wet, the small kind of clover yields more pasture in autumn, or it may be cut twice in a season, which is an advantage to those who have time to cut hay in June and October. But for my part, I have no time to make hay in these months. In June my time is fully occupied in hoeing corn, &c., and breaking up land for wheat; and in October I am always very busy securing my corn and root crops, fall ploughing, &c. The time for haying is July and August, and I generally find it best to be occupied about one thing at a time, as much as possible.

Yours, &c.,

W. GARBUTT.

Wheatland, March 15th, 1840.

*For the New Genesee Farmer.***Selling Rohan Potatoes--By John North.**

Messrs. Editors.—In your last paper, R. Harmon, Jr., expresses considerable surprise at the high price which I obtained for my Rohan Potatoes; and says he should be glad if I would inform him how I disposed of them to so good advantage. You will therefore please inform Mr. Harmon, that in the town of Alabama, Genesee county, which is nearly fifty miles from Rochester, there was never such a thing seen till last year, and but very few persons had ever heard of them. Some had known them sell, or had bought one or two at about 25 cents each. All were astonished at their productiveness; so that they willingly offered and gave the prices which I mentioned. It should be borne in mind also, that the Genesee Farmer is but little known in that neighborhood, and Mr. Harmon's advertisement had probably not met the eye of any there; so that they did not know at what prices the potatoes were selling here.

Those engaged for the west are going to a neighborhood where a very few were raised last year, from seed which cost an enormous price; but so satisfactory were the results, that many can be sold now in small lots, at very high prices, notwithstanding they are selling so low here.

Messrs. Editors.—If all of our farmers would take an agricultural paper; they would not only learn how to buy Rohan Potatoes at the lowest price, but also how to obtain and cultivate many other things which would greatly increase their profits, and of which they will otherwise remain in ignorance. I have induced several to subscribe for the New Genesee Farmer; and when I see a man pay over his fifty cents for it, I always feel that he is doing himself greater good than he could possibly do with so small a sum in any other way. It was by reading the Genesee Farmer that I was induced to make a little outlay, which resulted in a profit more than equal to the cost of your paper during an ordinary life time.

I am, respectfully, yours, &c.

JOHN NORTH.

Rochester, March, 1840.

NOTE.—The above communications were written for last month, but omitted for want of room.—Eds.

*For the New Genesee Farmer.***The Root Culture--The Potato.**

Messrs. Editors.—I am not quite through with the subject on which I commenced, which was the consideration of the *Root Culture*. To show to the farmers in the clearest possible manner, how much it is for their interest to turn their attention to this system of farming, I exhibited, in my former communication, the circumstances in which they were placed, particularly in relation to the high prices of *mill feed*.—Wheat was their hobby, because it was the crop, which, more than any other, increased the amount of their funds. So much, therefore, of their land was put into wheat, that it was impossible to keep stock to much extent, without changing the system of farming. And hence arose, among the Farmers of Western New-York, the necessity of cultivating *Roots*; because a very few acres in *Roots*, properly managed, will furnish the greatest amount of the best kind of food for farm stock.

One prime article of this kind is the *Potato*; because it is easily produced, it is adapted to our soil and climate, a large amount can be produced from a small quantity of land, and because it will endure rather longer for *late feeding* in spring, and summer.

For six or eight years I have very successfully cultivated the *mercer potato*, for various reasons. 1st. Because, for the table, they are of the first quality.—2d. They fetch the highest price in market. 3d. They come very early to maturity, requiring only a short season, and at the same time they are of the first quality to use late in the season, or before new potatoes are fit for use. 4th. They can be planted thicker than any other potato, on account of the smallness of their tops. Each eye puts forth a shoot which comes very early to maturity, and then dies down, without putting out any side shoots like the *Pinkeye*, the *Rohan*, and most other kinds. 5th. Though they are no better flavored than the *Pinkeye*, yet in other respects they are superior; their tops are so much smaller that you can plant more upon an acre and produce more; they are more easily harvested, because the tubers are not scattered all over the hill like those of the *Pinkeye*, but they lie close together in one snug family.—6th. You can also harvest them very early, and thus have them out of the way of early frosts.

But when potatoes are extensively grown, it is best to cultivate two kinds, one kind for the *table*, and one kind for *farm stock*. Should the *Rohans* continue to maintain the extraordinary high character which they have hitherto had, I should decidedly recommend them for *stock* and the *mercer* for the *table*.

Soil.—So far as my experience goes, potatoes flourish on every kind of soil in this vicinity, except a *stiff clay*. As often as I have planted on a stiff clay, I have lost my labor and almost all of my seed.—Therefore, for the last two years, I have avoided planting on clay entirely. And, in case there happen to be any small patches of clay on my potato ground, I plant them with some of the *Royal White Bean*.

Preparation.—I select a clover sod. Early in the month of April, haul on and spread twenty loads of long manure to the acre. Plough under the manure deep and clean, laying the furrow-slice over flat. Roll it down and harrow it with the furrow. On or about the first of May, work it with the cultivator till the surface is finely pulverized and mellow. If you intend to plant *mercer* potatoes, mark out the rows shallow, with a one horse plough, three feet apart. But if you intend to plant the *Rohan*, let your rows be full three feet and a half apart.

Planting.—Cut your *mercers* to three or four eyes, and your *rohans* to only one or two. Drop your *mercers* one foot apart in the row, and the *rohans* full three and a half feet apart in the row, with only two

eyes in a hill. Then cover the seed either with the plough or hoe.

After Culture.—As soon as the Potatoes come up two or three inches high, run the cultivator once or twice between the rows, and give them a dressing with the hoe, so as to stir the earth next to the shoots, destroying the young weeds, and earthing up the young plants only a trifle. Then, before the potatoes are in blossom, and before the young tubers begin to be formed in the hill, go through, twice in the row, with a one horse plough and turn the earth towards the potatoes; and then follow with the hoe, to complete the earthing up, to put the tops in the proper position, and to destroy the remainder of the weeds. After this it is very improper to be moving the soil around the hills, because, to disturb the young tubers after they are set and before they have come to maturity, is very injurious to their growth.

Harvesting.—Never commence harvesting your potatoes till they have come to full maturity, or till the frost has killed the tops down. While the tops are green, the tubers are growing and improving; therefore, unless you wish to harvest your potatoes for the purpose of making room for a wheat crop, let them remain in the ground as long as they continue to grow. In digging them, use either the plough or the potato hook. As soon as they are out of the ground, let them be picked up. Never permit them to remain out in the sun or air longer than you can possibly help.—I am well aware that this direction is at once in opposition to the rule of many farmers, which is, to allow their potatoes to remain out in the sun, *drying* as long as they can, and yet have them picked up on the same day they are dug, in order that as much of the earth as possible may cleave off from them. This is very bad management for potatoes designed for table use; because it renders them strong, or acid in taste.

Every attentive observer has noticed, that that part of the potato which happens to be uncovered in the hill, changes its color to a dark green. This portion is very much injured in taste; in fact it is unfit for use because it has imbibed, from the atmosphere, deleterious qualities. As soon as potatoes are dug and exposed to the light and air, this change begins. Every attentive observer has also noticed, that potatoes are the best flavor and quality after they have come to maturity and while they are yet in the ground. The longer they are dug and exposed to light and air, the more of this high flavor is gone, till it is wholly lost and they become unpalatable and unwholesome. Potatoes that remain in the earth where they grew, winter, are in excellent condition for the table in the spring. In view, therefore, of all these facts, let me prescribe a rule in harvesting the potatoes, which will tend to perpetuate through the whole season, these excellent qualities. As soon then as practicable after digging, remove the potatoes designed for the table to a dark bin in the cellar. After depositing thus the whole crop, or as many as are designed for the table cover them over with earth or sand, and they will retain their excellent qualities till they begin to sprout in the spring, and require to be removed. When shipped for sea, they ought to be put into casks and covered with sand.

Where potatoes are boiled for hogs, the water which they are boiled should never be given them, but thrown entirely away, because it contains deleterious or poisonous properties. P

Chili, March 15, 1840.

Important Discovery.—A very important discovery in Paris is spoken of. A gentleman has succeeded in making very excellent bread from beet root, mixed with a small portion of potato flour. It is said that this bread is of very excellent quality, and can be sold to the public at so low a price as two sous a pound.

For the New Genesee Farmer.
Use of Long Manure.

Much has been said in the Genesee Farmer and other agricultural journals, during the last four or five years, to show the great advantage of using manure in its fresh and unfermented state. It has often been asserted that by the process of fermentation in the heap, or lying in the yard until partially rotted, much of its strength escapes and is lost, that might be saved by depositing it in the ground in its fresh state, there to undergo the process necessary to prepare it as food for plants. This new practice seems to have obtained generally, and the results have proved satisfactory to those who have published them.

Being fond of new things myself sometimes, I subscribed practically, and without further inquiry to this theory, and have for several years used large quantities of coarse manure from the horse stable and yard, in its fresh state, and tried it on a variety of soils and crops until I was fully satisfied it is not best for me, whatever may be the opinion or practice of others. I have, in some instances, put from 60 to 70 waggon loads upon an acre of ground, ploughed it under and covered it well, and I received but very little benefit from it to the crop the first year, especially if the season proved rather a dry one. Nor could I ever trust to its mouldering remains for a crop the year following, for on ploughing the surface there appeared to be but very little substance remaining to benefit a second crop; but like a salt which the air dissolves it, and the winds blow it away, and its principle effect has been successive crops of grass and weeds, increasing my labor in hoeing crops at least four fold, and entailing a more serious enemy in the multitude of cut-worms and grubs to which it gives birth.

It was taught, when young, by an experienced farmer, never to use unfermented manure, especially from the horse stable, for any kind of crop, if other could be obtained; yet it was considered better than none at all, and often valuable help to corn, potatoes, and some other coarse feeding crops. I have seen corn materially injured by using it in the hills in a dry season. For the last four years I have dug into the same pieces of ground, large quantities of coarse rank manure, when preparing my garden for early vegetables, and have always been disappointed in not realizing the benefit I expected either to the crop or soil; and have been surprised, when working the ground, to find so few remains of the liberal dressing of the previous year, and that little, if it had been buried with the soil to seven or eight inches, instead of being decomposed, was often dry and mouldy.

Experience has convinced me that half the quantity of manure that has undergone the process of fermentation in the yard or heap, or has become partially rotted while exposed to the weather, will produce the largest average crop, and whether the season be wet or dry, no disappointment will ensue on account of its use.

I am resolved never to use any more in a raw state, unless it be in the potatoe drill, considering it, as I do, a loss of at least half the value, when compared with that which has been turned over once or twice, and thoroughly fermented in the heap, and prepared for the immediate use of plants intended to be nourished by it, and the seeds of weeds entirely destroyed.

The greatest advantages I have realized from the use of short, unrotted manure, has been by spreading it on the surface of the ground when prepared for seed, and mixed with the soil, but not ploughed under. In this way it protects the crop in time of severe drought, and in a wet season benefits it more than if ploughed under and covered with more than six or eight inches of soil, with little or no action of weather upon it. — It is better remaining on or near the surface for one sea-

son, I think it worth more to turn under with the plough, for the benefit of future crops, than it was in its first state. The experience of every gardener must certainly be against the use of the raw material.

Too much cannot be said in favor of cooking food for hogs, and other stock; and I would as soon feed my hogs with uncooked potatoes as my plants with raw manure. I have tried both, and I think the loss in both cases about the same. A. BRYANT.

Eric co. Nursery Buffalo, 1840.

Ontario County Waking Up!

The following letter breathes the true spirit of improvement; and the proposition of the writer is indeed a liberal one. We hope his praiseworthy example will soon be followed by enough others to ensure the desired result.

MESSRS. EDITORS—Having seen and read much in your valuable journal in relation to Agricultural Societies and Shows or Fairs, and believing them to be of vital importance to the farming community, and indeed to the people in general, I am anxious to see them becoming more common, so that their influence might be felt by our worthy farmers of the Genesee country.

It is an error with many to suppose that it required large appropriations or subscriptions to maintain an agricultural society; sufficient only being required to pay the annual premiums, and other incidental expenses, which may be limited or expanded according to the views of the society. The great object is the assembling together of the cultivators, to converse and consult on the affairs of agriculture in general, and every thing connected with it.

I have witnessed, as I dare say also many of your readers have, the good effects these societies have produced in the old country, and indeed many places in our own; and I really consider them of the greatest importance to the prosperity of the farmer, and should wish to impress upon my brother farmers in Ontario County in particular, the importance, nay, I might say, the necessity of forming a society of this kind without delay; and as we have many agriculturists in our county of known wealth and influence, it is to be hoped they will come forward and begin the good work. Although I am a new settler, and almost a stranger in the county, I will commence with a subscription of \$50, and if nine others can be found to subscribe \$100 each, I will make a tenth to complete the thousand dollars, which would place our society on a good and firm basis. I am, with many others, desirous that this society should go into speedy operation; for really this county, which is one of the most desirable counties in the State, requires it.

Without intruding more upon your time, I shall conclude by wishing you every possible success for your new and laudable undertaking, and you may rely upon my individual exertions in rendering you all the assistance I am capable of.

GEORGE HENTIG.

Genesee, April, 1840.

P. S. Would it not be desirable that where societies are now forming, and Shows or Fairs contemplated, that farmers who have good stock, or more than they wish to keep, should expose them for sale on these occasions, and persons who are replenishing or increasing their stock, will then have an opportunity of obtaining the best blood in the country?

For the New Genesee Farmer.
Improvement of Horses—A good Stallion.

I know of no subject which more demands the attention of the farmers in this section of country, than the proper selection and improvement in the breed of horses. Sufficient care is not always taken to procure good sires; and less attention still, is paid to selecting horses adapted to practical farming purposes. Horse

ought to be selected with reference to strength, as well as beauty. It is no doubt apparent to the mind of every farmer of common observation, that some horses unite in their qualifications, adaptation for teaming and travelling, together with beauty of appearance.

There is a Stallion owned and kept near this place, which appears to unite these qualities, and as such, is almost a desideratum in this part of the country. It is an imported horse, and produces the best of stock. I take the liberty to send you a description of this horse, which I have procured for the purpose, in order that you may know how to speak of him to such as may make reference to you on the subject.

If some person, well acquainted with the different breeds of horses, would give us a little of his experience in this matter, he would greatly oblige many subscribers. R. N. B.

Medina, March 18th., 1840.

Remarks.—The horse referred to above, is the imported English horse "Emigrant," which was brought to this country in 1832, by the late John Walkington. He is called of the Cleveland Bay breed, and is said to be of a beautiful form and color, and to possess many desirable requisites. We hope all of our readers in that vicinity who have horses, will call and see for themselves, at the stable of C. Ashton, one mile west of Medina, Orleans co.—Eds. *New Genesee Farmer.*

Improved Stock in Henrietta.

It may be an advantage to our readers in the town of Henrietta and its vicinity, to be informed that Wm. C. Cornell has an improved Short Horn Bull (YORK CAPSON,) which is from the best imported stock of the late Stephen Van Rensselaer, of Albany, and is a very superior animal. His pedigree is good, and his stock is said to be unsurpassed by any in this country.—Farmers should not neglect such opportunities for improving their breeds of cattle.

Wm. C. Cornell's farm is about half a mile south east of West Henrietta—one mile west and two south of Henrietta Corners—and two miles and a half north-west of Rush; on the middle road leading to Rochester. For particulars, see handbills.

We also invite the attention of our stock-raising readers, to the advertisement of Mr. WEDDLE, on our last page.

For the New Genesee Farmer.
To Prevent Smut in Wheat.

MESSRS. EDITORS—As many farmers are slow to believe in the efficiency of brine and lime in preventing smut in wheat, I am induced to give additional testimony in its confirmation.

As our winter wheat is rarely smutty to any extent, we have never prepared that seed by brining and liming. But our Spring wheat having formerly been more or less smutty, we now prepare our seed in the following manner: After putting our seed into water, to separate the light kernels and oats, if there should be any amongst it, we put it into a tub, and pour strong brine, about blood warm, on to it till it is completely covered. After it has steeped three or four hours, we take it out in baskets, in which we let it stand until it is sufficiently drained; then we spread it on a barn floor, and rake in fresh slacked lime until the wheat becomes dry, when it is fit for sowing.

The past two seasons, we have prepared our seed wheat in this way, and not a kernel of smut has been found in the crops raised from it; while our neighbors who neglect this preparation, are generally troubled with smut.

We sow our spring wheat about the first of May.

CASSANDER

Hume, March 11, 1840.

For the New Genesee Farmer.

To prevent Bad Taste in Milk. Butter & Beef.

Having observed that one of your correspondents wishes to know if there is any method of feeding ruta bago to milch cows, without having the milk and butter taste of the turnip, I am happy to say, I can give you an answer, which I think, upon trial, will prove satisfactory. Never allow the cow to taste of the roots within 6 or 8 hours of milking; but feed her immediately after each milking, and do not give her any more of the roots at a time than she will eat in 2 or 3 hours; and be careful that she does not get any more till after she is milked again. By this method cows may be fed on ruta bago or other turnips, and no person will be able to discover the taste in the milk or butter.

Upon the same principle, those who wish to feed fattening cattle upon turnips, may do so without any danger of affecting the taste of the beef, provided they will omit feeding this kind of food, two or three days previous to killing. I have heard of cases where the beef was rendered unfit to eat, on account of the animal's eating a few turnip tops or cabbage leaves just before being slaughtered. The difficulty may be obviated, as mentioned above. Your friend,

JONATHAN DENNIS.

Portsmouth, Newport Co., R. I., March, 1840.

To prevent the Taste of Turnips in Butter.

Messrs. EDITORS—One of your correspondents wants to know how to prevent the taste of turnips in the butter from cows fed on these roots; and having had some experience in the matter, I will give you an answer to the inquiry. If it meets your approbation, I may hereafter give your readers some further observations relating to the dairy. In some of the best districts in England, the taste of the cream and butter is affected by the manure used on the pastures, and the following means are adopted to prevent it.—

The first method is almost universally practised on the milk and cream brought into the London Market, in order to prevent the taste being affected by the different kinds of food on which their cows are fed.

1st Method—Dissolve an ounce of nitre (Salt Petre) in a pint of pure water, and put a quarter of the pint into every fifteen gallons of milk as brought from the cows. This will effectually prevent any bad flavor, and cause the milk and cream to keep sweet a longer time. The quantity of nitre is so very small, that it does not at all affect the wholesomeness of the milk.

2d Method—Let the cream get well sour; and before churning, take out a quarter of a pint of the cream and put it into a well scalded pot or jar, into which gather the next cream, and stir it well; do the same with each successive gathering, until enough is saved, and well soured, ready for a second churning; then take out a small quantity and commence anew as before.

The cream being sour before churning, is no detriment to it, and this method will prevent any bad taste in the butter.

Yours, &c.,

Rochester, March, 1840.

W. R.

The taste of Turnips in Milk.

A correspondent in your 2d number asks information for preventing the flavor of butter being affected by the turnips upon which the cows are fed. I have had occasion to feed the Ruta Bago in large quantities to my milch cows, and have seen several remedies for the turnip flavor, some confidently recommended, but none have proved effectual. I have found however, that very thoroughly working the butter, and salting it as much as a regard to its taste will admit, is by far the best remedy. In most cases, it has nearly, if not entirely, removed the unpleasant flavor, even when the cows have been fed upwards of half a bushel per day. I suppose from this, that the turnip fla-

vor is chiefly in the buttermilk and not in the pure butter itself; and that as the buttermilk is removed from the butter by successive workings, this flavor gradually diminishes, until, as the process is perfected, it entirely disappears.

Persons of reputed acuteness of taste in this respect, whom I have supplied with butter from turnip-fed cows, and which was thoroughly treated according to the preceding mode, have pronounced it of first-rate excellence, and have been unable to detect the peculiar flavor of the turnips.

T. J.

Seed Corn.

Every farmer should be very particular to select the most perfect corn for his seed, for the more perfect the seed the more vigorous will be the plant. Seed corn should be selected in the fall, before the crop is cut up. By walking between the rows, the earliest and most perfect ears are easily seen, and in a very short time a supply can be gathered. A few of the husks are to be left on each ear, then braided together, and hung up in a dry and safe place. When planting time arrives, the seed is ready and the time and trouble saved of overhauling some forty or fifty bushels in the crib, to make a selection.

The earliest varieties are undoubtedly in the main, the most profitable. The yellow and white Canada, perhaps, would generally be considered too small. If, however, the soil is rich and it is planted one way much nearer than the large common corn, a medium crop can be obtained.

The Dutton corn is considered to be an excellent kind by most who have cultivated it. It was obtained by Judge Buel, in Vermont, of a gentleman whose name it now bears. It is yellow, twelve rowed, and earlier than the common twelve rowed varieties.

The eight rowed yellow is an early kind, quite productive, and is now pretty generally raised in our section of country. The true name is not known to the writer. The kernel is large, broad, and of a pale, yellow color.

Preparing the Ground.—If the soil is not naturally rich, it should be made so, by a good dressing of manure. Much depends on the richness of the ground. Good seed, and the best of attention, will not secure a good crop, if the soil is worn out, or poor. A farmer had far better plant but half, or one-third the number of acres, if, by so doing, he can thoroughly manure his corn ground. He will save much labor, and have more and better corn.

The ground should be ploughed no earlier than is necessary, to be in readiness for planting, and then the work ought to be well done. The furrows cut narrow, in order more finely to pulverize the earth. If the ground is naturally low and wet, it should be drained; if not, ploughed in narrow lands, not to exceed one rod in width: then thoroughly harrowed and marked out one way. Great care should be taken in planting, to cover the corn with fine earth. Corn, well planted, will be ready for the Cultivator, one week earlier than that carelessly planted, or covered with stones, lumps, or coarse, dry earth. If the soil is clayey, avoid, if possible, planting in wet weather. The practice of planting when you have to cover the corn with mortar, is a very bad one. When the weather becomes dry, the soil bakes, and it is almost impossible for the young plants to force through its crust. As soon as the rows are readily seen, the cultivator should be started, the weeds and grass destroyed, and the earth lightly stirred around the hills. If hoed but twice, and on old or stubble ground, the plough should be used the last time, passing the right way the last time, to drain off the water after heavy rains.

JOHN B. BOWEN.

Messrs. EDITORS—Will you, or some of your correspondents give a description of the Italian Spring

Wheat? Whether it is, or is not bearded, and the color of its berry? I purchased some for seed this spring, said to be the Italian. The berry is red, whether bearded or not, I do not know, I have noticed since, in the old Gen. Far., and also been informed by some of my neighbors, that the Italian Spring Wheat is not bearded, and the berry is white resembling the White Flint.

J. B. B.

Ledyard, April 20, 1840.

Remarks.—The Italian Spring Wheat is heavily bearded. The berry is rather dark colored, and appears somewhat transparent. The common Siberian is very similar to the Italian, but does not grow so strong or produce as well, and the flour is said not to be as good. The variety called Bald Siberian, differ from all other kinds of spring wheat with which we are acquainted, in its being almost entirely destitute of beard. The berry is rather lighter colored than either of the preceding, and is said to make very good flour; but it bears no resemblance to the flint wheat; and if there is any kind of real Spring wheat answering the description given by friend Bowen, we should consider it "something new under the sun."—Eds.

Disease in Cattle.

Messrs. EDITORS—A neighbor's ox was taken sick when in good flesh and died. The symptoms were, want of appetite, constipation, and a cautious movement of the head. His horns, at first cold, were afterwards warm; his eyes were shrunken and dim, and he gave strong manifestations of severe pain in the head. During the whole course of his sickness he eat but two ears of corn and three or four potatoes and drank but little water. Several gentlemen pronounced the disease to be the "Hollow Horn." The oxentine was put upon his head, his tail split, physic given him, and his horns bored. When the horn was penetrated, there issued a thin liquid, nearly the color of water and mixed with blood. The physic did not operate, and all that was done, seemed not to alleviate his sufferings. The ninth or tenth day of his illness he suddenly expired. It may not be improper to state that he had been able to lie down and rise at pleasure until within a few hours of his death. Upon a post mortem examination, it was found that a portion of the pith of both horns, was in a fluid state, and other portions softened, and of a yellowish color. Between the two plates of the skull was a fluid, resembling that found in the horns, and also matter, analagous. Between the dura mater and arachnoid membranes, was a quantity of water, and also in the ventricles of the brain. The membranes on the posterior lobes of the brain, were highly injected with blood, and somewhat thickened. His tongue was considerably swollen towards the base, but no lesions of kind were discovered. The lungs crepitated throughout their greater part, but the lower lobes were gorged with blood as to be impermeable. In a word, there had been inflammation of those lobes. On the pericardium was found quite a quantity of fatty growths, quite unnatural to it. The whole circumference of the heart in its largest diameter, presented a knobbed appearance, and when these were cut, they presented a mixture of fatty matter, and red, part of organized substance. The whole heart was in a state of hypertrophy, and its auricles, ventricles, and the vessels leading from it, were distended with fully coagulated blood. The intestines were not examined for want of time.

Now the question arises, what was the disease? and where its original seat? I am not familiar with the diseases of brutes, but from the symptoms while living, and the post mortem appearances, I do not hesitate to state my belief, that its original location was in the membranes of the brain, and by a rapid extension

of the inflammation, disorganization of the pith of the horns was the consequence. The peculiar look of his eye, constipation, the motions of his head, and examination; all go to prove conclusively to my mind, that the disease was highly inflammatory, and located in the membranes of the brain. His lungs and trunk were affected sympathetically, and the disease of his heart had undoubtedly been of long standing. As I am not acquainted with the disease called "Hollow Horn," I know not whether this was the disease; but if it was, the treatment generally pursued will prove unavailing. It is a notorious fact, that for high grades of inflammation, no mild means will reduce the circulation to its proper standard, and that what is done, should be done quickly, and with a bold hand. For this disease, I would recommend in the first stages copious depletion, the amount of blood taken to depend upon the size and condition of the animal; and for an ox, one gallon would be little enough. If the bleeding did not make a sensible alteration for the better, during the first ten hours, it should be repeated, though not so much as at first. In conjunction with the bleeding, a smart dose of cathartic medicine should be administered, and cold water poured from a height upon the head, once in two hours, during the first days of treatment. Boring the horns in this disease can be of little use, as the matter between the tables of the skull will not be evacuated by the means; and turpentine on the head will only increase the inflammation. Providing the original seat of disease is between the tables of the skull and in the horn, boring them would probably afford some relief; but when the brain, or its membranes, are the seat, this measure will prove futile. Whether this disease is of frequent occurrence, I know not; but oxen are valuable property, which was an inducement for me to examine the animal, and pen this article, in hopes it might prove useful to some of your numerous readers.

Scipio, April 21st, 1840.

Pumps for Wells.

MESSRS. EDITORS—Water, being one of the most important elements which enter into the composition of the animal and vegetable kingdom, and being indispensable to our subsistence, the great Creator has caused it to circulate freely everywhere through this world which we inhabit. I would, therefore, inquire what are the means generally employed for drawing it from the world's reservoirs?

This question might be answered by a person of but very limited observation; for you may travel from Maine to Georgia, and, I venture to say, you will not see, on an average, one pump to five hundred wells. But you will see crotched trees and well poles, wooden cranks and gudgeons, chains and buckets, all of which will answer the purpose, if something better cannot be obtained. I have myself labored many a year with the above-named well tackling, and but recently found in an easy and rapid method of obtaining water from my well, which is by means of a Pump.

Permit me, through the columns of your journal, to recommend to my farming bretheren, an immediate renunciation of well poles, cranks and buckets, and the adoption of the pump. I am confident that one year's use of it would more than compensate them for any extra expense.

I am now using "Minor's Improved Patent Pump," made in Rochester, by W. A. Langworthy & Co., and it lifts water with such great facility, that it is mere pleasure to work it, and were it not for appearing boyish, I am not sure but I should throw out every day seven times as much water as is necessary. In short, it is the most perfect and durable article of the kind that I have ever seen. CORRESPONDENT.

Irondequoit, March 26, 1840.

For the New Genesee Farmer.

Preserving Fence Posts, Wooden Pavements, &c

MESSRS. EDITORS—Observation has taught me that leached ashes are an excellent preservative of timber. I have noticed that the staves of old leach tubs used 20 years since, and left standing partly in the ground, exposed to the full effects of air and water, are preserved in perfect soundness by reason of the lye with which they are saturated and the ashes which surround them. An oak well crotch, on the premises of S. Gillet, in Avon, had, in 1838, stood 36 years, and was still hard and sound, having been preserved from decay by a quantity of leached ashes being thrown around it, from a leach that stood near. I have tried the experiment on my own fence posts for 15 years, and those which were surrounded with ashes would be perfectly sound, while others which had no ashes applied would be entirely decayed.

I now set my fence posts 2½ to 3 feet deep, put two quarts of good house ashes at the bottom, then fill up the hole with small stones and earth to within four inches of the surface, packing it down firmly with a driver; then fill up around the post with ashes, a little higher than the surface of the ground. This will take less than half a bushel of ashes to a post, at an expense of three or four cents each, and will render the post at least doubly durable. By renewing the ashes at the surface, once in two or three years, either from the house or the ashery, I have no doubt that the Oak, Red Beech, and other kinds of timber, would last as long as Red Cedar. I have 100 rods of board fence, built in the spring of 1839. The posts are Oak, except a few Chestnut and the Red Cedar mixed in. I set them according to the above plan, and shall therefore give the subject a fair trial. Yours, &c.,

HALL COLBY.

Greece, one mile west of Rowe's Nursery.

Sunflower Seed—Inquiry.

A friend in Niagara county asks for information respecting the value and use of Sunflower Seed, for making oil or for other purposes. Also, the best manner of cultivating, and the amount of produce per acre.

The following article, from the *Madisonian*, is the latest information we have seen on this subject:

The Helianthus, or Sun-Flower Plant.

We presume it is not generally known that this plant, which is so often regarded as worse than a useless cumber of the ground, is cultivated extensively in some parts of the United States, and turned to a very valuable account in a variety of ways. We have before us a letter from a firm in the interior of Pennsylvania, which gives us some interesting facts, which we think worthy of publicity.

The oil derived from the sunflower seed is pretty well known. Its excellence for fancy painting and druggist use, is said to be confirmed, and we are even told that it is equal, if not superior, to almond or olive oil for table use. One acre of ground will produce from forty to fifty bushels of seed, sometimes much more. Good seed will produce a gallon of oil to the bushel, and the oil has been sold at \$1,50 per gallon, when flaxseed oil stood at ninety cents.

The refuse, after the oil is expressed, is said to be a valuable food for cattle.

The leaf is manufactured into segars, of a mild, pleasant flavor, possessing, it is said, powerful pectoral properties, highly commended by physicians in many diseases of the chest. The leaves, properly cured, will bring from five to fifteen cents per pound.

The stalk, when stripped of the leaf and seed, may be burnt, and a superior alkali made from the ashes.

The comb of the seed, or properly the filaments of the flower is excellent feed for cattle or hogs.

The Helianthus is cultivated in the vicinity of York, Pa., and a gentleman in North Carolina, in 1839, cultivated one hundred acres.

Edging for Borders.

M. A. W., of Athens, in Georgia, has given us in a late number of the Magazine of Horticulture, an interesting article on edging for flower beds. After

enumerating various plants for this purpose, and rejecting them along with the box, because the ever-green, as he alleges, soon takes up too much room, harbors slugs and other noxious vermin, exhausts the soil by its fibrous roots, and is apt to be winter-killed at the north, and summer-killed at the south.—he proposes a new plan:—

"I planted in the same line, and so close as almost to touch each other, one bulb of each, repeatedly, three kinds of *Amaryllidea* of nearly the same habit, and which multiply by offsets so fast, that they can be easily obtained in sufficient quantity, viz: *Zephyranthes* * *Atamasco*, *Z. rosea*, and *Sternbergia lutea*.—Early the next spring, my row of *Atamasco* flowers, of the most brilliant white, changing to pink, was the admiration of every passer-by. They continued to push forth for several weeks, and for a considerable time after, their leaves formed as fine a margin of green as one would wish to see. These leaves had scarcely begun to die away, when the flowers of *Z. rosea* began to appear, and kept flowering nearly all summer. The leaves lasted till late in the fall, when the *Crocus*-like golden flowers of the *Sternbergia* took their place, and had a doubly cheerful effect from all the adjacent vegetation having "fallen into the sere and yellow leaf."

We can easily conceive the beauty of such edging; but find in this district insuperable obstacles at the outset. *Sternbergia lutea*, though hardy with us, and remarkable for the rich glossy green of its leaves, increase very slowly in the limestone soil of the Genesee country; and *Zephyranthes atamasco* fares still worse; we have not had it to bloom more than once before it has declined, and eventually perished. *Z. rosea* we have not tried, but it appears not to withstand the severest winters even in England.

With all due deference, however, we must think that Box is the best plant for edging in this climate, whatever may be the case in Georgia. It is neither damaged by the cold of winter nor the heat of summer; and we know not that any noxious vermin have found a harbor amongst its leaves. Neither ought it to exhaust the soil by its fibrous roots: a spade passed down near it on the inside of the border, would limit their extent in that direction; but Box for edging should be kept in a dwarf state, not exceeding three or four inches in height, and trimmed to a straight edge like the roof of a building. In this condition it is not found to be troublesome. We have nothing so permanent that is so easily increased—nothing that has leaves of so fine a green through all the vicissitudes of the year. X.

* *Amaryllis lutea*. † *Amaryllis atamasco*.

New Varieties of the Plum.

From a late number of *Horey's Magazine of Horticulture*, we learn that Henry Corse, Esq., of Montreal, has made the production of seedling plums a study for some years, having raised thousands of seedling trees, with the hope of obtaining something that should excel every existing variety.—To three or four of these he has appended names.—It appears that his *Nota Bena* is known as a superior plum in some of the collections near Boston; but his *Dutator* is one of the largest and finest plums ever produced—exceeding in size the *Magnum Bonum*, or *Bolmer's Washington*, and equalling the *Green Gage* in flavor. It is a brownish purple, covered with a beautiful bloom—juicy, rich, and high flavored.

We also learn from the same valuable work, that the *Reine Claude Violette*—already introduced into one or more collections at Salem,—is one of the few purple plums of which the flavor will bear comparison with that of the *Green Gage*. Another new variety—the *Royal Hytime*—also purple, with an exceedingly rich flavor, larger than the *Reine Claude Violette*, and ripening a fortnight or three weeks before it,—is in possession of the London Horticultural Society. We believe both these varieties are of French origin.

Expense of Improvement.

We have received for publication, a communication signed "Old Farmer," but as it is written in a style which we should be sorry ever to see introduced into our columns, we shall make only a brief abstract, and reply to the objections of the writer. He complains chiefly of the practice of charging for the introduction of improvements in agriculture—objects to the high price of Rohan Potatoes, and of Durham, and other improved cattle—and seems to consider it extortion for the owner of a fine bull, to ask five, ten, or twenty dollars for his use. Many of his remarks are perfectly just; but he has condemned, indiscriminately, the innocent and the guilty. His attack is not so much upon impositions—humbags—as upon the introduction of really valuable improvements.

We believe that if "Old Farmer" will candidly examine the subject, he will find that the charges of "selfishness," "avarice," and a disposition to "strut and gobble," which he so freely bestows upon all advocates of improvement, are far from being just. We think "the laborer is worthy of his hire;" and that when an enterprising individual has, at great expense, made or introduced an improvement, he deserves, at least, some compensation. We knew, as a general rule, he never gets a full one. Charles Collings spent a life in the improvement of the breed of cattle—he surely had a right to ask something for his labor. Others have spent thousands of dollars in the importation of that breed to this country—with what face of liberality or honor can "Old Farmer" ask such men to give him the cost of their fortunes? He reminds us of a parsimonious traveller who complained that the inn-keeper charged more for a peck of oats than they cost him—not remembering that the inn-keeper had house-rent, stable-rent, and ostler, to pay, besides making a living for himself and family. A young man purchased a bushel of Rohan Potatoes, for four dollars, and as long as his neighbors thought he had paid dearly for his whistle, they were willing to ridicule him for his "book farming;" but as soon as they found that this variety possessed extraordinary productiveness, they *magnanimously* came forward and asked him to give them some to try. "Old Farmer" should not ask improvers to give him the result of their labors, without reasonable compensation, until he has given away the result of his labors,—his crops of corn, wheat, and oats, and his cattle. But even admitting that money has been actually made in some cases by the introduction of new and valuable improvements; a man who risks much, and often loses much, is certainly entitled occasionally to some profit. Is a man never to make any thing? Must he always sell every thing at cost? Would "Old Farmer" be willing to do this? If the actual cost of his crop of corn is only twenty cents per bushel, would he be willing to sell it at twenty cents per bushel? If his wheat crop of forty bushels the acre, has cost him only ten dollars an acre, is he willing to sell his wheat at twenty-five cents per bushel? Until he has done so, we hope he will retract his charges.

Encouraging Improvements!

I am surprised, sir, to see the great lack of that true spirit of improvement amongst my neighboring farmers. They call me the Book Farmer, because I encourage the American Farmer, the Cultivator and the Register; and yet I find they are, (many of them) pleased to borrow occasionally, which gives me an opportunity of rubbing them now and then. If I succeed in my experiments, they say nothing; but if I do not, then they say, "I told you so."

I purchased a Rohan potatoe last Spring, and tried to keep it a secret from them, through fear of ridicule; but it leaked out, and I had not only to show it, but tell the price—I paid a dollar for it. "A dollar," they exclaimed, and I believe one of them would have called me a fool, if he dared, for he got quite in a rage about it, wondering that I could allow myself to be

so imposed upon. Well, sir, the potatoe was cut into sixteen pieces, and I gathered from these sixteen hills, two bushel baskets full—but when I told my friend of it, and assured him by my witness, he made no further remark than "I must ask you for two or three to try!!!" Spirit of Buel! what feelings for an American Agriculturist! Respectfully,
A YOUNG BOOK FARMER.

United States Census of Agriculture.

It is known to most of our readers that this is the year for taking a new census of the United States.—We have been favored with a copy of the instructions given to the marshals and their assistants, by which it appears that the reports are to embrace a vast amount of highly important information, which has not heretofore been obtained. We are particularly pleased to find that the statistics of our agriculture are to occupy a prominent place in the census. We annex a list of interrogations which are to be proposed to every farmer, and we hope all will be prepared to answer them correctly. Had this been done every ten years, what a vast fund of interesting and highly important information the successive reports would contain!

The marshals and their assistants will commence their operations in June next, and proceed through their respective districts as fast as due regard to correctness will allow.

The interrogations respecting the number of inhabitants, and cattle, horses, &c., are to be answered with reference to the 1st. of June, 1840; but those relating to crops, value of produce, &c., are for the past season, 1839.

Interrogations—Agriculture.

What is the number of your horses and mules?
How many neat cattle have you?
How many sheep?
How many swine?
What is the estimated value of your poultry of all kinds?
How many bushels of wheat did you grow in 1839?
How many bushels of barley?
How many bushels of oats?
How many bushels of rye?
How many bushels of buckwheat?
How many bushels of Indian corn?
How many pounds of wool?
How many pounds of hops?
How many pounds of wax?
How many bushels of potatoes?
How many tons of hay?
How many tons of hemp and flax?
How many pounds of tobacco?
How many pounds of rice?
How many pounds of cotton have you gathered?
How many pounds of silk cocoons?
How many pounds of sugar?
How many cords of wood have you sold?
What is the value of the products of your dairy?
What is the value of the products of your orchard?
How many gallons of wine have you made?
What is the value of your home-made, or family goods?

Horticulture.

What was the value of the produce of your market garden in 1839?
What was the value of the produce of your nursery and green-house?
How many men were employed by you?
What is the amount of your capital invested?

Best Varieties of Corn.

We believe that a very common error in the culture of corn, is the selection of too large and late varieties. The result is a large growth of stalk and cob, at the expense of the grain. Farmers cannot bring themselves to think that a field of small, insignificant looking corn, can produce like one of large and broad-leaves, and luxuriant appearance. The largest crops, however, which have been cultivated in this country, have been raised in the northern states, with the smaller varieties.

At a late agricultural meeting at Boston, E. H. Derby, Esq., of Boston, gave a statement of his farming in New Hampshire, and more particularly of his culture of corn. He had six acres; the product of

which was 400 bushels. Of this one acre yielded 131 bushels. The variety he plants is the Golden Sioux. This, it is well known, is one of the very earliest and smallest varieties, being more so than the early Canada. It was planted in hills of three stalks each, at a distance of two feet, by two feet eight inches. Larger varieties planted so thickly, would be destitute of ears; but with this, the small size of the stock admits of a greater number. We have cultivated it successfully in drills two feet apart, and six inches asunder in the drills.

A very important advantage from the culture of the smaller varieties, is their early maturity, and consequent escape from early frost. This quality is also of very great consequence, when it is intended to follow the corn by a crop of wheat.

Scotch Oats.

Mr. E. HARMON, of Wheatland, has left at the Rochester Seed Store a few bushels of a variety of Scotch Potstoe Oats, which are the heaviest we have ever seen raised in this country. They weigh 44 pounds the bushel. Mr. H. has raised this kind for three years past, and thinks very highly of them.—The seed was first brought from Scotland, and from less than half a bushel sown, he obtained 33 bushels. He has grown them in connection with common oats and gives the Scotch a decided preference. They yield with him from 60 to 70 bushels per acre, which is more, by measure, than the common sorts produce besides which there is the great difference in weight. The straw is tall and strong, they are not more liable to lodge than other sorts, and if cut at a proper time before over ripe, they are not apt to shell off in being. They ripen rather earlier than common oats and should be cut as soon as fairly ripe.

Chevalier Barley.

This variety of Barley is now the most generally approved in the best districts of England and Scotland. It is much superior to the common kinds, both in quality and productiveness, and sells for a higher price in market. The following account of its origin, is taken from a book entitled, "the present state of Agriculture in England."

"An extraordinary fine ear of barley was observed and selected by a laborer of mine, in the parish of Denham, in 1819; in the spring of 1820, I planted 24 grains in my garden; in 1825 I planted half an acre of this species, and half an acre of the common species, the land under precisely similar cultivation.—The product of the first amounted to eight and a half coombs; and of the last to six and a half coombs; (34 and 26 bushels.) The ears of the first averaged 34 grains, the second 30; the grains of the first heavier as four to five. In the course of 5 or years, it was generally accepted and approved in my neighborhood, and I promoted its fair trial, charging only the current market price for it."

A good supply is for sale at the seed store.

Annot Barley.

This is a newer variety, an improvement on the foregoing, and we believe has not heretofore been introduced into this country. The following account taken from Lawson's Catalogue of the Agricultural Museum at Edinburgh, where the writer obtained some of the seed.

"This new and very superior barley is the product of two ears picked in a field on the farm of Flowera Corse of Gowrie, in 1830, since which period it has been grown by Mr. A. Gorrie, at Annot Garden (hence its name). Last year it was sown on a ridge in the middle of a field, with Common Barley on the one side and Chevalier on the other. In bulk of straw seems to have the advantage of both these kinds. It was five days ripe before the former, and about a fortnight before the latter. It was about 2 1/2 lb. per bush heavier than the Chevalier, &c. (See *Quarter Journal of Agriculture*, March 1835.) The grain even more round and plump than that of the Chevalier, of a bright yellow transparent color.

Sample in grain and straw by Mr. A. Gorrie, weight

per bushel, 57 lb., grown beside the samples of Chevalier mentioned above and weighing 54½ lb.

As only a small quantity of the seed was procured, it will be distributed for experiments. (Agents and Correspondents of the "New Genesee Farmer" can obtain rare seeds, gratis, on application at the Rochester Seed Store.)

Tares or Vetches.

We should be glad if some of our readers would favor us with the results of their experience in the culture and use of *Tares* in this country. They are much used in England, and highly esteemed; and we believe some English farmers are in the habit of growing them in this country and in Canada. Still they are but very little known as yet, and we believe deserve a more general trial. We extract the following remarks from "*Lois's Elements of Practical Agriculture*:"

"The Tare, *Vicia sativa*, is one of the most esteemed of the leguminous forage-plants of this country.—It is an annual plant, indigenous, and hardy. There are several varieties of it, one of which is distinguished by producing yellow seeds.

"Tares, when used as green forage, are cut after the pods are formed, but long before the seeds become ripe. Tares, therefore, being in the class of crops not allowed to mature their seeds, are not exhausting to the soil. On the contrary; in relation to the farm, they are to be considered as restorative crops, from the quantity of manure which the consumption of them affords. They are exceedingly nutritious, and supply a larger quantity of food, for a limited time, than almost any other forage-crop.

"All the animals of the farm are fond of this legume, and all thrive upon it in an eminent degree.—Hogs may be fattened entirely upon it. It is suited to milk-cows, causing them to give more butter than any other species of food, and it is employed extensively in the feeding of horses. All the English agriculturists are impressed with a high opinion of the value of tares. They are not only casually employed, as in Scotland, to fill up the intervals between the cuttings of clovers, but they are often the principal source of feeding from the month of May to November."

The Borer in Quince Trees, &c.

The Borer is very destructive to the Quince tree, the Mountain Ash, and not unfrequently injures young apple trees. We are not certain that it is the same worm that infests the Locust tree.

Its presence may be easily determined by examining the tree near the ground, when its filth, somewhat resembling saw-dust, will be visible. Remove these obstructions, and its hole, cut through the solid wood, may be discovered. We have drawn them forth by means of a barbed wire, in considerable numbers.—We believe this plan, though original with us, was first practised near Boston; but it is rather an irksome operation, and in consequence we have devised a plan to supersede it. So far it has answered well. Apply a coat of tar to the bark from the surface of the ground to the height of two or three feet. It is most readily, evenly, and thoroughly done, by dipping in the hand. A newspaper is then rolled round the tree, so as to cover up the tar, and tied with a thread in several places. We have found it to protect the tree for one year, when the application should be repeated.

Now is the time to perform the operation, as the insect in its perfect state, will soon be abroad to puncture the bark and deposit its eggs. No time should be lost.

For the New Genesee Farmer.

Slugs on Fruit Trees.

Messrs. Editors.—In strolling a few days since through the pleasure grounds of my friend T., of this place, my attention was directed to a number of once beautiful and thrifty cherry trees, which had been completely destroyed by the operation of a small worm, or slug, of a dark, slimy appearance, on the leaves of the tree in summer.

Mr. T. informs me that they made their first appearance in July, 1838, and that their operation was confined wholly to the leaves where they were first

discovered. After remaining on the tree about four or five weeks, they suddenly disappeared. The trees soon exhibited every appearance of decay; but, inasmuch as they seemed to prey on the leaves alone, it excited no fears for the vitality of the tree. He had the pain and mortification, however, of seeing them return last summer, apparently with renewed vigor, and an increase of strength, when they soon completed their work of destruction.

A few thoughts on this subject, by myself, were published in the Gen. Far. in August last, when the "little monster" was imperfectly described, and a brief account of his ravages on the trees in this vicinity. I offer them again for insertion, almost verbatim, in hopes that they may lead to the discovery of some preventive, or remedy for the evil.

About three weeks since (July 1st.) I discovered them on my trees of the same kind. After a few unsuccessful experiments to destroy a few of them (taken from the tree) I came, reluctantly, to the conclusion, that there was no remedy, and that I must lose my trees. You can hardly imagine my surprise when, about ten days after I first discovered them, nearly, or quite all of them, had disappeared. I have just dropped my pen to examine them again, (August 1st.) but, after diligent search, I cannot find one remaining. The leaves are much eaten, and I believe the trees are materially injured.

The query in my mind is, what should have caused their sudden disappearance, as no means of any kind were used to remove them from the leaves, or trees?

Messrs. Editors, I should still like to know something of their origin, as well as what means would effectually destroy them, without injuring the trees.—If you, or your valuable correspondent, D. T. or any other person, can give the desired information through the medium of the Farmer, they would save the lives of many fine trees, and confer a favor on the public, especially on

ALPIA.

Ludlowville, March, 1840.

I was much pleased with the remarks of your fair correspondent, "ANETTE," in your last number, and agree with her that your paper should, and does, exert a mighty influence over the whole farming community. I hope she will not soon lay down her pen. I met with your paper accidentally, and adopt her language, when I say I found it to "contain so much interesting and instructive matter," that I was induced at once to subscribe.

Remarks.—We know nothing of the history of this slug, except that its ravages on the leaves of the cherry tree, have been observed for several years in many parts of the country; and that in a brief editorial notice in the Gen. Farmer of July 1835, it was said they infested the leaves of several kinds of fruit trees, in the vicinity of Rochester. We think it evident that this slug is in its larva state, and that the perfect insect has wings,—from the circumstance that it has suddenly appeared at the distance of several miles from any of its former localities. Last season we observed it in our nursery for the first time: but could discover nothing of it on the cherry trees in our fruit garden, eighty rods to the westward.

From the editorial notice mentioned above, we learn that "it is only necessary to dust them in the morning while the dew is on, with lime, or ashes, which may be easily done by throwing a few handfuls of either into the tree. Another effectual method is to sprinkle them with a decoction of tobacco."

Two days after that number of the Gen. Farmer was printed, our friend L. A. S., of Lockport, wrote a very interesting article on this subject, which appeared a fortnight after in the same paper. He says, "I applied soap suds—a strong wash of lime water—but without the least apparent effect. I heard it sug-

gested that as the slugs wore a slimy coat, a dry application would be better than a wet one. Accordingly I threw over the trees with a shingle, a quantity of dry unleached ashes, while the dew was on the leaves, and every one coated with the ashes was destroyed. My trees now appear nearly free from them—the leaves green, and I am highly gratified with the experiment. It is now three weeks since I commenced operations, and I am satisfied that this remedy is complete. It should be repeated on the trees attacked, twice a week for three or four weeks, and cannot fail of being effectual. I also applied slacked lime to some of the trees, but the ashes are sufficient, and within the reach of every one."

In regard to the cause of their sudden disappearance, mentioned by "Alpha," we can only speak conjecturally. Many insects have insect-enemies which devour them, and keep their numbers within certain limits: the enemy increasing in proportion to the food that he finds. Thus the Hessian Fly is destroyed by a minute insect called the *Ceraphron destructor* by SAY; and trees are often disencumbered of plant lice by the inroads of the *Surphus*, or the *Hemerobius*. It may be further remarked that larva, when ready to enter the pupa state, often disappear suddenly; but if this was the case with the slugs, there must be several generations in a season. T.

The Curculio.

In a late number of the Farmers' Register, there are two articles on the Curculio, copied from the New England Farmer, and written by Joel Burnett, which are particularly deserving of attention. He considers this insect as the only obstacle in the way of raising plums; and lays down four propositions which we copy for the purpose of comment:

"1st. I have found that the Curculio is on the trees, ready for its operations, very early, even before the plums are large enough for it to deposit its eggs in them."

This information may be turned to good account, by destroying the insect before it commences operations; and this may easily be done as soon as they are found on the tree. Spread two large sheets under the tree, (we had a pair made for this purpose)—jar the tree by the stroke of a mallet and most of them will drop on the sheets, and lie still for some seconds, pretending to be dead. Their dark color contrasts with the whiteness of the sheets, so that they are discovered at a glance, and easily secured. In this manner several years ago, we destroyed about three hundred in the course of an hour. As a stimulus to timely operation, we should remember that they are as easily killed before the mischief is done, as afterwards.

These particulars were communicated in the second volume of the Genesee Farmer; but it may be well to repeat that shaking the tree with our hands will only bring down a part of these insects. The small number that we caught in this way, induced us to believe there were very few on the trees, until we saw that much of the fruit was punctured; and it was this that led us to suspect that our work had not been thoroughly done. We therefore spread the sheets under the tree, and made the following experiment:—On shaking it well we caught five curculios; on jarring it with the hand, we got twelve more; and on striking the tree with a stone, eight more were dropped on the sheets. We then revised our work, and found we had been operating to great disadvantage.

"2d. It continues its labors into August.—The same curculio that stings the plum and peach, I have found repeatedly operating on the apple."

Dr. Tilton, who first made us acquainted, by his publications, with the manners of the curculio,—was of the same opinion; but we are inclined to doubt its correctness. In the year 1831, Noyes Darling, 1810

Mayor of the city of New-Haven, stated in the New-York Farmer, that the worm which infests the apple, becomes a moth or muller. We immediately repeated his experiment, by putting these worms with part of the apple, amongst moist earth in a tumbler, and covering them with a piece of window glass. In due time the perfect insect came forth, very different indeed from the curculio. The result was published at the time.

"3d. It gets on the tree by flying, though it may crawl up the body at times."

We believe they more generally get up by crawling. Dr. Tilton says "two trees of the same kind may stand in the nearest possible neighborhood, not to touch each other, the one have its fruit destroyed by the curculio, and the other be uninjured, merely from contingent circumstances, which prevent the insects from crawling up the one, while they are uninterrupted from climbing the other." We have also been told by a neighbor who had tied by the upper end, a large bundle of unbroken flax round the tree, three or four feet from the ground, while the lower parts of the stem hung loose,—that it saved his plums. Yet we have seen the curculio fly away from the sheets on which they had fallen, when suffered to remain undisturbed.

What follows, whatever may be its bearing on this mooted point, should be extensively known. As this little animal is easily annoyed, trees standing before a store, or shop, or any frequented place, usually more or less escape injury. I have known trees standing near a hog pen, mature their fruit year after year, while others standing four rods distant, as surely failed.

"4th. It stings the fruit mostly in the night."

This fact is new to us; but such a habit would well agree with the timid nature of the insect.

We make another extract:

"The plum tree is subject to a disease on the limbs, a kind of excrescence or warty appearance, which Dr. Harris says is caused by this same curculio, puncturing the bark and depositing its eggs under it."

We hope this is not a fair specimen of Dr. Harris's labors in Entomology. The absurdity of the charge is evident, from the fact that the curculio infested the plum trees in this part of the State more than thirty years before any such excrescence disfigured their branches.

We cordially approve, however, of what follows:

"Dr. Harris recommends cutting out and extirpating these excrescences, and burning them before the last of June. †"

Hints for the Month.

This is a most important month to the farmer. On the proper direction of his work at this time, his success for the season greatly depends. Every thing should be conducted with energy, and every thing well finished. All the ploughing should be thoroughly performed, and planting done in the best manner. Slighting work, is the most costly operation the farmer can perform.

It is of vital importance, during this busy season, that horses and cattle be well fed, and kept in good condition, to accomplish properly the work assigned them. Animals constantly supplied with water, working or otherwise: regularly fed; regularly worked: and their wants always attended to,—will keep fat on a far less quantity of food, than when they are occasionally neglected, and suffered to pass their usual time of feeding, or overdriven, or deprived of water.

Those who own small farms, where land is high priced, will find the practice of soiling for domestic animals, a matter of economy. London says, "A field of meadow in good heart, mown and eaten green, will, at a rough estimate, produce treble the quantity of milk it would have done if pastured, and four times

as much as it would do in the form of dry hay." The value of the manure made this way, would overbalance the cost of cutting the grass.

Let no manure remain in the barn-yard after the present time. If not done already, direct all your force to accomplish it now. The large crops of corn which are sometimes raised in this country, are greatly indebted for their success to very copious manuring. We have, it is true, a very fertile soil, but corn can scarcely be overfed with manure; every load tells.

Corn may be planted too early; but to one error of this kind, there are a hundred by planting it too late. The precise time of course must vary in different regions. The first expansion of the oak leaf, is an old and very good rule.

Straight rows—these are the thing. How much more thoroughly and evenly the crop might be cultivated, if this were always attended to. When rows are crooked, one hill is run over, and another neglected, and the hoeing rendered laborious. But where they are straight, the cultivator passes evenly and safely, within an inch of each hill, and little is left for the hoe.

But the crows—who has not had a fine crop greatly injured by these black rogues? The remedy by tarring, we have never known to fail, when well performed. When slighted, it of course fails. The best way, by far, is to pour hot water on the corn to heat it, pouring it off again in a few seconds, and then put on the tar and stir it thoroughly. Every grain thus becomes coated with a fine and even glazing of tar. Roll the corn in air slacked lime, and it is ready for planting. A pint of tar will do for a peck of corn, though perhaps more would be safer.

Make large preparations for root crops—for mangel wurtzel and sugar beets, ruta bagas and carrots. The best variety of the sugar-beet, the Silesia, is to be preferred to the mangel wurtzel. It is most admirably adapted to the feeding of cows, and is good for hogs. The farmer should calculate on at least one hundred bushels for every milch cow,—to be fed during winter—the richness and excellence of the milk and butter thus produced, and the greatly increased quantity, will soon decide any doubt of the advantage of this root. Failure is commonly owing in the first place to poor soil, and in the second to neglect of weeds.—The ground should be as rich and mellow as a garden, and the seeds will vegetate: and the weeds should be kept down at the outset, and the growth of the plants will not be checked. Seven or eight hundred bushels to the acre may be expected if these things are strictly observed.

Many days of labor in cutting weeds, may generally be saved in the culture of all root crops, by a previous fallowing for a month or two, to destroy all the weeds, and rendering the soil finely pulverized for planting and hoeing. By a little labor in this way,—cutting the weeds with a cultivator and one horse as they first appear, for a few times, in the early part of summer, and thus almost superseding the necessity of hoeing, we have raised the white globe turnip at the rate of 750 bushels to the acre, at a cost of about two cents a bushel.

Ruta bagas are especially valuable for the winter feeding of horses, oxen, and young cattle. Let every farmer appropriate a portion of land now, for the culture of a crop,—manure it well, and keep it stirred to kill the weeds. Many suppose they necessarily require a sandy soil; but if very rich, and not wet, they will succeed about as well on a clayey as on a sandy loam. The only disadvantage of the former is, the cloddy surface is not so fit for a shelter for the turnip fly, hence crops on such soils are more frequently cut off by this insect; but this doubtless might be prevented by rolling the surface after sowing. If the farmer has no drilling machine, he may sow the ruta baga

broadcast; this, though not so good, is successful.—We have seen a broadcast crop of 1200 bushels to the acre. Manure was the secret.

Different Soils.

Last month we spoke of the importance of a fine soil, of shade, and of a regular supply of moisture for delicate seeds; but another view of the subject may be taken. Among the myriads of plants that embellish our globe, varying in form, in substance, and in color, great constitutional differences exist. Some, like the sea-weed, only vegetate in brine; others, like the wild rice of the west, flourish most in fresh water.—The truffle always remains under ground, while the mistletoe only germinates aloft on trees, and seems to feed on air.

But between the thousands that spread their roots through the earth, and their leaves to the light depending on timely showers for their nourishment, great differences exist in regard to soil. The yellow bloom of the *Hypoxis*, is only seen on close clays; the perennial *Lupin* confines itself to beds of sand; and the locality of the *Talinum* in Pennsylvania is on naked magnesian rocks. Lime is essential to the chief objects of the farmer's culture; and a species of *Veronica* from its attachment to this mineral, is called in Virginia, the "Marl Indicator."

Besides the mineral constituents, however, there are vegetable principles derived from the decay of particular plants, which become a part of the soil, and give it a peculiar character. We may separate the sand from the clay, and both from the lime and magnesia or iron—weigh the vegetable matter, and then attempt to make a similar soil of new material in the proper proportion; but unless we have the recrements of similar plants, it cannot successfully be done.—We have seen no artificial soil that would suit the rose-flowering locust; and the heaths only grow in peaty earth, or something analogous. The decaying leaves of the sour pine, so pernicious to the cereal grasses, is a rich manure for the red sorrel.

Among the great numbers of ornamental plants which are collected from so many points of the earth's surface, it is not reasonable to expect that land of the same quality can accommodate them in the best manner. Some will flourish in their new abode; others will vegetate for a time, while a third class will speedily dwindle and perish. Various soils, therefore, differing in both their mineral and vegetable composition, are necessary in extensive gardens. Small spots of two or three feet diameter, in many cases will be sufficient. Some annual flowers will doubtless require them as well as shrubs and herbaceous perennials; and the greater the variety of soils, the greater will be the chance of success. On a small bed of sand-carried more than twenty miles, we have *Pinus rigida* and *Magnolia glauca*, growing in luxuriance; though every attempt to cultivate them in our common soil, had failed. Many beautiful plants require peat from the marshes; and a small cask of the right soil, would impart health and vigor to the *Kalmias* and *Rhododendrons*.

The Flowers of Spring.

(IN A LETTER OF THE 25TH. ULT.)

In cool weather, the snow-drop and other early flowers, continue long in bloom; but a few warm days dismiss them, and call forth others in more rapid succession.

The Persian Iris, so beautiful, perfumes the garden for a time, and the Mezerion—the first shrub that blossoms in spring—adds its fragrance. Its acid fruit, however, causes some to reject it; but that might speedily be stripped from its branches, and children might be taught to keep their fingers to them.

elves, (a useful lesson in later life.) Then such an equisition would be enjoyed.

The bloom of early flowers, however, may be much prolonged by planting in different situations. Give them the reflected heat of a wall or close fence, and protect them at night from the frost, and a week or more may be gained in earliness. Plant them on the opposite side of such a wall or fence, so that they are shaded through most of the day, and they will come forth a week or two later than those in the open border. To see the first flower of its kind, does us good, and we love to prolong the stay.

The genus *Corydalis*, like *Eschscholtzia*, is remarkable for the delicacy of its leaves. *C. cucullaria* and *C. canadensis*, (the latter fragrant,) are natives of our woods. *C. cura* and *C. nobilis* are from Siberia. All these add to the beauty of the border.

Erythronium dens-canis is a native of Europe, and decidedly prettier than either of the species indigenous to this region. There are two varieties, white, and red-purple. The flower is soon past, but there is beauty in the leaf.

The primrose or polyanthus (*Primula veris*) runs into many varieties. We have selected a dozen or more of the finest we could procure or originate, and some of them are very pretty. Deep red-purple, pale lilac, yellow, and almost white, are among the colors. The double varieties are highly valued.

Narcissus is an interesting genus of more than sixty species. It includes the Daffodils: the single yellow, the double yellow Ajax, and the double phoenix with white petals and orange centre. The Trumpet major, in two varieties, however, is our earliest kind. It also includes the Jonquil with two or three rich yellow flowers on a stem. *N. angustifolius*, white with a crimson-tipped nectary, and *N. floribundis*, also white with a yellow nectary, are fine. The latter from Spain, requires some protection, and is scarcely suited with our common soil.

The English Violet, (*Viola odorata*), white, blue, and double, is very modest and very sweet. It has received many encomiums from the poets.

Hyacinths are a lovely group of plants; and come nearer to being of all colors than any other flower that we know. It should be planted in a rich soil, that its bunches of blossoms may be large and fine; and when set out late in autumn, the earth should be firmly pressed down over it, to prevent the frost from heaving up the soil, and separating the stem from the bulb.

Of all the flowers of this month, however, we doubt if any makes a finer display than the liver-wort (*Hepatica triloba*.) It only opens in the warmer part of the day. From the woods, we have procured them of many colors, and with a considerable approach towards a duplication of the petals; but so far have found none that could be called double. *Sanguinaria canadensis*, also from the woods, with pure white blossoms, should be associated with them.

The Crown Imperial is a magnificent plant, admirable for its form and singularity. The double varieties, however, are mere distortions, and not worth cultivating.

When *Viola tricolor* has passed the winter without damage, (and snow is its best protector,) it blooms very early. Many of the new varieties are very showy and very pretty.

One more, and we have done. The periwinkle, (*Vincetoxicum*), an evergreen trailer, begins to open its fine blue flowers.

Clearing New Lands--Inquiry.

MRS. EDITORS—I am about to remove on to a new farm, and if you, or your correspondents, will give some hints respecting the best method of clearing and cultivating new lands, you will confer a great favor on
A SUBSCRIBER.

Henderson, Jefferson co., April, 1840.

The Meeting at Rochester.

In another column will be found a call for a public meeting of farmers and friends of Agriculture, to be held at Rochester on the 28th inst. We believe it is not necessary to remind our readers of the importance of this meeting, in order to induce them to attend.— But we wish to remind them of the necessity of being there promptly at the hour, and having their minds somewhat prepared to speak and act understandingly on the subjects which will be discussed. We do not mean by this, that they should be prepared to make long speeches; for time will not admit of it. The meeting is for the transaction of important business, which will need to be done "with accuracy and despatch;" and therefore it is necessary that every farmer who attends, should be prepared to do his part.

The following are some of the leading topics which will probably be discussed, and the questions which will need to be decided:—

- 1st. A consideration of the present condition of agriculture, and the farming interests in this region of country; and
- 2d. what are the best means of their advancement? This will give rise to the question,
- 3d. Shall an Agricultural Society be formed? and if so,
- 4th. What shall be its name and character, and plan of operation? What extent of country shall it embrace? (This will depend upon the attendance from adjoining counties.)
- 5th. Is it advisable to have a Fair, or Exhibition, next fall? if so, shall premiums be awarded? and how shall the funds be raised? These, and questions growing out of these, will most likely occupy the whole attention of the meeting.

Acknowledgments.

We are indebted to the Hon. T. KEMPSHALL, M. C. for several interesting documents, and a package of seeds, kindly sent us by him from Washington.

Also to Hon. H. L. ELLSWORTH, Commissioner of the Patent Office, for a package of seeds of West India Plants, just received from him. We shall immediately sow them in a hot-bed, and transfer them to the Green House.

A Donation for the Museum.

Professor C. DEWEY, of this city, has presented us with a collection of dried specimens of grasses, which we shall add to and arrange during the summer, for the proposed Agricultural Museum. Our readers are indebted to his able pen for several interesting communications which have appeared in our columns, and for the essay on *Grasses*, part of which appears in this number.

To Readers and Correspondents.

Several communications which need revising are unavoidably deferred for the present; and a pressure of business must be our apology for the omission of some cuts, and other matters intended for this month.

From the *Kalamazoo Gazette*.

Beet Sugar in Michigan.

NEW GENESEE FARMER.—The first three numbers of this new agricultural sheet is now upon our table. We think it is fully equal to the old Genesee Farmer, and will prove an invaluable work to the agriculturist. It is nearly as large as the "Cultivator" and costs only half as much; and we think will be more valuable to our farming community.

In answer to the "Farmer's" inquiry, in reference to the manufacturing sugar from the beet, in this State, we would say, what we have heretofore stated, that the company established for that purpose in the adjoining county of St. Joseph, did not meet with success the last season, on account of the incapacity of their workman. They have now sent an agent to France to secure an experienced workman to take charge of the business. If they succeed in getting a competent workman, as they undoubtedly will, we presume success will attend their efforts this season, as they succeeded so far last as to make molasses.

For the New Genesee Farmer.

THE GRASSES.--No. 1.

In common language, the grasses include all those herbaceous vegetables, which are used, or may be used, as food for our domesticated animals. Turnips, peas, and the like, would be considered as excepted. In the language of botanists, the grasses embrace those plants with hollow and jointed stems, with solid joints, with long, parallel-veined leaves, rising from elit sheaths, and with one or two, or more, chaff-like leaves, or glumes about the flower. While this description excludes the *rush-like* and *sedgy* grasses, some of which are eaten by cattle, it comprehends the most important vegetables; for it includes wheat, rye, barley, oats, sugar-cane, rice, wild rice, Indian corn, &c., as well as timothy, red-top, and all the common grasses. It excludes indeed, clover, pea, buckwheat, and the like; but it evidently embraces the most important articles of agriculture.

In the views now to be presented to the farmer, the grasses used for food for our animals, alone are respected. Those which are intentionally cultivated are very few; but several others are mixed with these in more or less abundance, and some of them are worthy of more attention than they have yet received, and others may be soon introduced.

Vast provision has been made in the multitude of grasses, for the support of the graminivorous race of animals. More than eighteen hundred species have been described by botanists; more than three hundred are ascribed to North America; and more than one hundred and twenty are found in the State of New-York. While these are useful for the food of cattle to some extent, is it not probable that far more will ultimately be found valuable to the agriculturist?

The value of the cultivated grasses for our working animals, as well as for those that graze only, is inestimable. They cannot be sustained on wheat, rye, oats, corn, and the like, but must have more volume put into their stomachs. Whether it is that grain has a nourishment too concentrated to be used alone, or that the stomach of the graminivorous is adapted, by its capacity, for the use of the leaves and culms themselves, which is the most probable, and that this capacity must be filled up by the food, it is very clear that they must have a cosier food with the finer, for their support. Hence comes the advantage of even the *innutritious cut-staw* of wheat, or rye, or oats, mixed up with their grained provender. There must be volume, as well as nutriment, in the food of our animals, and especially of those which are to do the hard work for us. For pasturage, as well as hay, the grasses have an immense value.

In the selection of grasses for cultivation, the object to be effected is the first thing to be considered, and the adaptation to this object is the first business of practical agriculture. For the early pasturage of spring, or the late feed of autumn, we need the grasses most appropriate to those parts of the year, as well as for the hay of summer. One grass may be more nutritious in the early stage of its growth, and another in the latter, while some are better fitted to be food for horses, and others for cattle and sheep.

The quantity of nutriment in the different grasses, is probably very different, and is not very easily ascertained. The experiments made under the order of the Duke of Bedford, at Woburn, England, and often

referred to as the *Woburn results*, or *experiments*, have thrown the most light upon the subject. They are not indeed perfectly satisfactory, as the laboratory of the stomach may find better and more useful combinations of matter in a vegetable, than can be found in the laboratory of the chemist. Still, they may be of great service now, and lead to other and more determinate results. The farmer who is intelligent and nice in his observations, will be led to very certain and definite conclusions on the relative value of the different grasses, by watching, for sufficient periods of time, the condition of his animals, as they are supported upon different kinds of food. If attention is paid to the season and soils, to the relative ages and vigor of the animals, and to the quantity of labor performed by the working animals, and of butter, cheese, beef, &c., by those that are not workers, and accurate records are kept of all those for comparison, it will scarcely be possible that fifty of the best farmers in a county, pursuing a similar course, can come to different conclusions. Soon, at least, other observations will make the necessary corrections; and the relative value of the grasses will be ascertained. It was shown by Sir Humphrey Davy, in his important work on Agricultural Chemistry, that vegetables contain five substances, on which their power of nutrition may depend, viz: *saccharine*, *mucilaginous*, *bitter extract*, *albuminous*, and *saline*, matter. The first of these is well known to be highly nutritious, and the second and fourth are probably little less valuable. It is probable, indeed, that more or less of the vegetable fibre itself is converted into nutriment in the process of digestion.

To aid the farmer in coming to the most valuable conclusions, and to guide him in experiments for improvement in agriculture, it may be advantageous to contemplate the properties and history of the more important grasses, with reference to their relative value already ascertained.

1. *Timothy Grass*, or *Herd's Grass*, as it is often called, *Phleum pratense* of botanists, and *Cats-tail grass* of the English, is too well known to need description. It is said to be common over the fields of Europe. It took one of its names from *Timothy Hanson*, who carried the seed from New-York to Carolina in 1780, and another from its value as food for herds of animals, and another name from the form of its spike or long head of flowers. The botanists gave to it the Greek name of an unknown ancient plant.—According to the *Woburn experiments*, it is a very valuable grass, containing more nutriment when the seeds are mature, than any other grass in that state, and being in the proportion of 23 to 10, or more than twice as much. If it stands too long, however, it becomes too dry and hard to be relished by animals and forms poorer hay. If the season is not a wet one, it should be cut earlier for hay. The high relish of its hay by horses, if it is cut in the time of flowering is well known. In England it is considered an early grass for feeding, and yields much herbage, and will, after being fed upon, send up its culms and flower abundantly upon rich soils. If it is cut for hay too late, animals select only the finer and more delicate parts, and leave the rest. As a general fact, there is no doubt that it is cut too late in the season to make the best hay. The farmer has a deep interest in having his hay of the best quality. In the market it will give him a higher reward for his labor. When it can be depended on, the better quality ever brings the higher price. Mowing over the fields, this grass presents a beautiful appearance.

There is one defect in this grass; it springs up very slowly after it is mown, and therefore the second crop is liable to be small. This is especially the case, if it is cut much after the time of flowering, and gives an additional reason for an early mowing. This fact, and

so me others, appear to have given *Timothy grass* much less estimation in England than in our country, though it is said to be rising in value there. Our climate may be more favorable to its growth; besides, a smaller variety seems generally to have been cultivated in England, which yields much less hay, and is inferior to the larger in the proportion of *twenty-five to eight*; a circumstance which shows the advantage of knowledge, and the necessity of care in the selection of seeds.

2. *Meadow Fox-tail Grass*. This is the true *Fox-tail*, *Alopecurus pratensis*, of botanists, and named, both by the common people and the botanists, from the resemblance of its head or spike of flowers to the shape of the tail of the Fox. It is more loose and bushy than that of *Timothy grass*. This is a favorite grass in England, and cultivated both for pasturage and hay, and is indigenous to Britain and other parts of Europe, from which it seems to have found its way into our country. I have not known it cultivated; but small patches of it are found frequently in the meadows of New-England and this State. It is said by the English to possess the "three great requisites of quantity, quality, and earliness, in a superior degree to any other. It is often fit for the scythe by the middle of May, (in England;) it flowers twice a year, and gives more bulk and weight of hay than any other grass."—London.

These properties commend it to the attention of the agriculturist. The second mowing is said to give a greater yield than the first. The soil, in which the meadow Fox-tail luxuriates, is that of a rich clayey loam, which is so common in our section of country. The quantity and quality of this grass, on a sandy soil, is found each to be only two-thirds of that on the loam just mentioned.

It is highly recommended for pasturage, and in laying down pasturage, it is said, by *Sinclair*, that one-eighth of the seed should be of this Fox-tail grass. It is slow in coming to full perfection, so that a field of it should stand and be mowed or pastured for several years. Its permanence, nutriment, amount of produce, and early growth, give it, in the language of *Sinclair*, a decided preference.

Who has known of any adequate trial of this grass in our country, to test its excellence or adaptation to our soil and climate?

There is another Fox-tail grass, the *Alopecurus geniculatus*, of botanists, which is rather more common in the meadows than the preceding. It is bent at the joints, so that the stem continually changes its direction, and has a distinct sea-green color, even more so than that of *Timothy grass*. It likes a moist soil. In England it is considered a valuable grass for the produce of hay, as well as for pasturing. Because our well known *Timothy grass* is so excellent, the farmer should not be prevented from giving those grasses an experiment which shall decide on their importance in agriculture. Both should be cut for hay in early flowering. They seem to give the promise of more tender stalks, and more delicious hay. Certainly the English agriculturists give few grasses a superior commendation.

3. *Orchard Grass*, *Cock's-foot Grass*, the *Daetylis glomerata* of botanists. It is often found in the shady meadows of orchards and about barns. The botanists have named it from the growth of its heads of flowers somewhat like the fingers and thumb, and the English from the resemblance to the foot of the barn-faet. It is a tall, large, and pretty coarse grass, with its flowers growing rather one sided. It yields a large amount of herbage towards the roots, and is reported to be very valuable in England for pasturage, and has indeed received the highest commendations. Its seed might be easily gathered. In England it is

fed upon immediately after the season for turnips has passed, as it is an early grass, and grows with much rapidity. To get the full benefit of the grass, it should be raised on a light soil, and should be kept fed down, as it is too hard and coarse for hay. It is sown in our meadows, but may be deserving of higher consideration as a grass for pasturage. It is certainly one of great bounty, as it waves its heads in the wind above the ordinary grasses of the meadow. It is found over much of Europe. From the *Woburn experiments*, the produce at flowering is about one-twentieth more than when in seed, and great at both times. But even for the early cropping of spring, it was found to be some inferior to that of *Timothy grass*. Still, it grows so rapidly, and is so readily eaten by sheep, horses, and cattle, that it is superior for cropping to most of the grasses, cultivated in England. The seed is now for sale over our country, and the grass is in the course of trial. It is hoped that the experiments will be made on a scale adequate to determine the advantages of the grass to the agriculturist.

(To be Continued.)

Mulberry Trees.

Whatever inconvenience or disaster may result to individuals from speculations in the mulberry, we apprehend that the nation will be benefitted by that excitement, to a much greater amount; and wherever these trees withstand the winter without damage, and the expenditures have not been too great, we think there is much to encourage the proprietors. We do not believe that land can be appropriated to a more profitable culture.

A gentleman, near Baltimore, who has a large stock of the multicaulis, says, in a note to us, "I expect to make two hundred pounds of silk next summer," and another, near Philadelphia, informs us that he intends to feed as many silk worms as he can find food for.—He has many thousands of the multicaulis standing out in the open field, uninjured by the late severe winter. "Indeed," he adds, "they look better than some which were put into the cellar last fall."

The climate of the Genesee country, however is not so well adapted to this tree, though we think it will do better here than many persons apprehend. Eager to increase it, we have planted it in the richest soils which have stimulated its growth till the frost struck it.—This was most strictly the case with a few which we raised from cuttings; while some which sprung from old roots in a thinner soil, were not damaged, and remain so, in the open ground. It is true that we bent them down after the deep snow fell, and threw some of it over them, keeping them down, out of harm's way, till the severest weather was past; yet it is well known that the multicaulis is much hardier when budded or grafted on the white mulberry; and perhaps it would be still more so if it stood on stocks of our native mulberry.

To those who intend to prepare for the culture of silk in this district, we would say, appropriate for it the poorest ground on the farm. Drain it thoroughly if nature has not done so, either under ground, or by ridging the surface, as the case may require. Give the multicaulis a fair trial on its own roots; and also on hardy stocks; but the introduction of some hardier variety would be prudent. T

The Silk Culture,

MESSRS. EDITORS—In expressing your views of the Silk business, in the 2d No. of your paper, you say that you think it to be one of the most important subjects which can at the present time engage the attention of the American people—that you think it is soon to form a new era in the prosperity of this nation, and that you have no doubt of its ultimate success. But, at the same time you say, that as not more than one

in a hundred of your readers are particularly engaged in the business, justice does not admit of your saying much on the subject.

Now, Messrs. Editors, I do not wish to criticise what you say, nor presume to lay down a rule for you to adopt in conducting your very valuable paper, for I shall be satisfied with it even if you say nothing on this subject. But, at the same time, if this business be of so much importance to the nation, it must be important to every individual; and therefore I cannot see any injustice in your saying much on the subject. A great deal must be said before the community will become properly awake to this subject. Every farmer, and every man who has an acre of land should manifest some interest in the culture of silk, and should, more or less, engage in the business. But before this can be done there is much of ignorance to be removed, and prejudice to be overcome. Many people, perhaps the majority, have got an impression that it is all a "speculation," or "humbug," because some individuals have been engaged in raising and selling morus multicaulis trees at high prices, and made unreasonable profits; therefore the whole silk business has been ridiculed, as a visionary speculation unworthy of confidence. Now, gentlemen, I have no morus multicaulis trees for sale, but wish to purchase, therefore my motives need not be suspected on that ground.—But I am firmly convinced, and the more I consider the subject the stronger is my conviction, that this business is soon to become second to none in this country, cotton not excepted. I think so, because I see nothing to prevent it; but much to encourage it. To me it seems impossible that this nation should long consent to pay to foreign countries twenty millions of dollars annually, for silk, when it can be raised at a much cheaper rate at home. The business has been fairly tested and proved, that silk can be raised in the United States of a superior quality, and at a cheaper rate than in any of the now greatest silk growing countries. It has farther been proved that persons of a small capital and small farms, can receive a ten fold greater income than by any other process of farming. Now, Messrs. Editors, if this be case, is it not right for you to press the truth upon the minds of your readers? If this is a business which interests them all, ought they not to have the subject frequently laid before them? But I did not design a long article upon the subject. You will please excuse me for conflicting with your view of the thing. My excuse is, my ardent attachment to the silk-growing interest. But no more of it. Permit me to express my high estimation of your very valuable paper; and as you give all, the weak as well as the strong, an invitation to become its correspondents, I think you may hereafter occasionally receive my mite as a contribution to its pages.

Yours, &c., K.

Le Roy, April, 1840.

Remarks.—We fully coincide with K. in relation to the importance of the silk business; but we think he misunderstood, or at least has given rather a distorted view of our remarks on this subject, to which he alludes. We think that what we then said, and what we have since published, is as much as the warmest friends of the cause could reasonably ask; and as much as justice to the mass of our readers would admit. We shall continue to publish such articles, and such only, on the silk culture, as we deem best calculated to awaken interest, and remove prejudice on the subject; but until a larger proportion of our readers are engaged in the business, we cannot occupy our pages with the detail of practical silk culture, especially when there are papers exclusively devoted to this subject.—Eds. N. G. Fur.

With strength and counsel joined, think nothing hard.

In making innovations the utility should be clear.

For the New Genesee Farmer.

The Silk Culture.

Messrs. Editors—As you seem disposed to publish some articles on the subject of the silk business, I will put in a mite, which you will dispose of as you may think advisable. The articles you have published in former numbers on the subject, especially Mr. McLean's, are very interesting, but they do not apply particularly to the Genesee country, and my object in this communication is to endeavor to arouse the agriculturists in this region to a sense of the fact, that they are not located in a part of the country where it is useless to attempt to make silk. Yet I must acknowledge that the State of New-York is far behind many of her sister States in this business. But I hope that it shall not be said much longer that the Empire State is in the back ground in relation to so important a branch of agricultural and manufacturing pursuit.

I have for several years past been making silk in a small way, for the purpose of gaining a knowledge of the proper course to pursue, whenever I should think it advisable to enlarge the business. I commenced without any knowledge on the subject, except what I had gained by reading some publications. My wife never saw a silk worm until she raised them, and never saw a skein of silk reeled until she did it herself; and had no other than the common reel and spinning wheel; yet the first she ever made was pronounced by good judges, of superior quality; and every step we have taken in the business seems to strip it of the great mystery that is thought by many so much to envelop it, and render it vain to attempt it in this country. The raising of worms is as simple as raising chickens, and the entire management of them, and reeling the silk, is no more a mystery than the management of sheep and spinning their wool. Yet a great portion of our people remain ignorant in this particular, so much so, that I am often asked, "How do you keep your worms through the winter?—how can you spin the silk, &c.?" and there still may be some who read your paper, very ignorant on this subject, but who are well informed on almost every thing else. To such I would say, Wake up!—be not so drowsy over a subject of such vast importance. I would here just remark that worms are not kept through the winter, but hatched from eggs when the proper time arrives for feeding them; and as to the spinning of silk we have nothing to do—the worms do that part of the business—it is past the art of man to do it. The worms must spin it or we have no silk; and they not only spin but wind it into balls; and our first business with it, is to reel it from the balls; and here is no mystery. What woman would not suppose you thought her a novice indeed if you were to tell her she could not reel a ball of yarn?

I will not occupy more room on this topic. I would gladly impart to any one that will take the trouble to call on me, any knowledge I possess in relation to the management of worms or silk; and also to the propagation of the mulberry, in which I have had some experience. Perhaps some will now begin to think that I am in the multicaulis speculation, and wish to sell a few trees. Not so. I have no more than I want for my own use. The multicaulis speculation, although some may have lost money in it, will prove a very great benefit to the country, filling it with a very valuable tree to much greater extent than would have been done, had they not for a time commanded a very high price.

And now in conclusion, I would say to every farmer in the Genesee country, do not let the present season pass without each one having a few mulberry trees planted. Improve the present depressed price of the multicaulis for making a beginning. You probably

never will procure them cheaper. The white Italian mulberry is not to be despised. This is the tree that I have used for feeding worms, but shall hereafter use multicaulis in connection. Let every farmer, I say, set a few trees, obtain a few eggs, and make a little beginning. Make your own sewing silk, if nothing more. If you have children ten years old, they can gather the leaves and feed the worms. Every farmer might make \$50 to \$150 worth of silk, and hardly know that he had been to any expense. The inquiry may be made, "Where shall we find market for silk if we make it?" Never fear on that subject. Let the farmer make the silk, and a market will soon be found near at hand. If it were known that there was silk enough raised in the county of Monroe to establish a factory, we should not be long without; and you need not be troubled about your silk rotting on your hands, if we should not have such a market for a year or two. As I have said, make your own sewing silk, even if it is for your common house work; it is cheaper than you can make from flax, and if you have an overplus which you cannot dispose of to advantage, weave it into cloth either all silk, or mixed with cotton or wool. There is no more difficulty in weaving silk than cotton. It will readily be perceived, that if farmers make a beginning in this way, they would be prepared when a market opens to take advantage of supplying it immediately, while those that have not so done will be left in the back ground, and will have to lament when they see their neighbors selling their hundreds and perhaps thousands of dollars worth of silk yearly, that they had not been as wise. But after all perhaps the inquiry may be made whether there is any assurance that there will be any profit in making silk for market; and in answer I would say, that actual experiments made by many individuals the last season, have shewn, even at the lowest estimates, that the amount of clear profit per acre far exceeds that of any other crop.

If I should perceive that our farmers are making any movement preparatory to making silk, I may give a few hints in relation to the management of the worms, &c. in a future number.

A. GOODELL.

Perrinton, March 30, 1840.

Market for Cocoons.

Messrs. Editors—Can you tell me whether there will be any market for cocoons in Rochester or its vicinity next summer? I am one of that fortunate class who happen to have a good stock of morus multicaulis trees on hand, and as there does not appear to be quite as many buyers as sellers this season, I have concluded to plant mine, and amuse myself by feeding silk worms, provided I can dispose of the cocoons when produced. I know nothing about the business of reeling, twisting, &c., and do not want to undertake it.

It appears to me that if some person who has some knowledge of, and taste for the business, would procure one or two approved reels, and buy our cocoons, and reel and sell the silk, it might be made a very profitable business. If notice of a demand was given this spring, there would be an abundant supply of cocoons next fall; and much would thereby be done to encourage the commencement of silk culture in this vicinity.

MONROE.

Green-House-Inquiry.

Messrs. Editors—Will you, through your useful paper, give your readers a plan for building, and the necessary information for managing, a Green-House on a small and economical plan? If you do, you will much oblige at least one

SUBSCRIBER.

Greenville, O., March 13, 1840.

We have not time at present, but will do it soon.—

Eds

Farmer's Daughters--Female Influence and Education.

MR. EDITOR—I am truly grateful for the kind reception which my former communication received; and the regard which you manifest for your female readers, encourages me to offer a few more remarks for the benefit of Farmers' Daughters.—In order to excite them to effort, and induce them to aim at a higher standard of excellence, it is necessary to impress them with a more elevated idea of themselves, and remind them of the important influence which they must exert upon the community.

One of the greatest discoveries of modern times, is the truth of the position, that females are capable of high intellectual attainments, and that the good of community requires that they should have great mental culture as well as the other sex. The idea once generally prevailed, that female minds possessed so little energy, and their influence in the world was so small, that the education of daughters was a matter of comparatively little importance, and it was only necessary to give them a superficial education, more showy than substantial. Happily, however, this barbarian error is now exploded, and a host of living proofs can be found to demonstrate the fact, that with proper education, our sex are capable of acquiring every branch of human knowledge which can improve or adorn the mind; and men begin to see that it is necessary for the improvement of mankind, and demanded by the spirit of the age, that the intellectual standard of the female sex should be greatly elevated.

An eminent writer has said, "The females of America hold in their hands the destinies of this Republic; and on their influence depends the happiness and prosperity of the nation, as well as of every family." Another remarks that "Nature has given woman an influence over man more powerful, more perpetual than his over her. From birth to death he takes health and healing from her hands, under all the most touching circumstances; her bosom succors him in infancy, soothes him in manhood, supports him in sickness and in age. Such influence as this, beginning at the spring time of life, and acting in all its most trying moments, must improve or deteriorate man's character, must increase or diminish his happiness, according to the moral and intellectual gradation of woman. Thus upon her improvement in particular, depends human improvement in general."

I do not introduce these quotations for the sake of complimenting my sex, but because I believe that they contain important truths which ought to be impressed on the minds of all. If such is the power of female influence, what a mighty agent it can be made for the improvement of the world, and how important it is that this influence should be rightly exerted! Yet how generally has the subject been overlooked by the majority of writers! There are some, however, who have most ably and eloquently advocated this cause, and whose labors have done much for the improvement of our sex. The writings of Mrs. STOURMONT, to mention no others, are exerting an influence upon the mothers and daughters of America, which entitles her to a nation's gratitude. While on this subject I cannot refrain from quoting a few remarks from her powerful appeal to the guardians of female education.

"Is it not important that the sex to whom nature has intrusted the moulding of the whole mass of mind in its first formation, should be acquainted with the structure and developments of mind?—that they who are to nurture the future rulers of a prosperous people, should be able to demonstrate from the broad annals of history, the value of just laws, and the duty of observation—the blessings which they inherit, and the danger of their abuse? Is it not requisite, that they on whose bosom the infant heart must be cherished, should be vigilant to watch its earliest pulsations

of good or evil?—that they who are commissioned to light the lamp of the soul, should know how to feed it with pure oil?—that they in whose hands is the welfare of beings never to die, should be fitted to perform the work, and earn the plaudit of Heaven?

"That the vocation of females is to teach, has been laid down as a position which it is impossible to controvert. In seminaries, academies, and schools, they possess peculiar facilities for coming in contact with the unfolding and unformed mind. It is true, that only a small proportion are engaged in the departments of public and systematic instruction. Yet the hearing of recitations, and the routine of scholastic discipline, are but parts of education. It is in the domestic sphere, in her own native province, that woman is inevitably a teacher. There she modifies by her example, her dependents, her companions, every dweller under her own roof. Is not the infant in its cradle, her pupil? Does not her smile give the earliest lesson to its soul? Is not her prayer the first messenger for it in the court of Heaven? Does she not enshrine her own image in the sanctuary of the young child's mind, so firmly that no revulsion can displace, no idolatry can supplant it? Does she not guide the daughter, until placing her hand in that of her husband, she reaches that pedestal, from whence, in her turn, she imparts to others, the stamp and coloring which she has herself received? Might she not, even upon her sons, engrave what they shall take unchanged through all the temptations of time, to the bar of the last judgment? Does not the influence of woman rest upon every member of her household, like the dew upon the tender herb, or the sunbeam silently educating the young flower? or as the shower, and the sleepless stream, cheer and invigorate the proudest tree of the forest?

Admitting then, that whether she wills it or not, whether she even knows it or not, she is still a teacher—and perceiving that the mind in its most plastic state is yielded to her tutelage, it becomes a most momentous inquiry what she shall be qualified to teach.—Will she not of necessity impart what she most prizes, and best understands? Has she not power to impress her own lineaments on the next generation? If wisdom and utility have been the objects of her choice, society will surely reap the benefit. If folly and self-indulgence are her prevailing characteristics, posterity are in danger of inheriting the likeness."

"Of what unspeakable importance then, is her education, who gives lessons before any other instructor—who preoccupies the unwritten page of being—who produces impressions which only death can obliterate—and mingles with the cradle-dream what shall be read in Eternity. Well may statesmen and philosophers debate how she may be best educated, who is to educate all mankind."

I am afraid, Mr. Editor, that you will think I have forgotten the hint which you gave me respecting your journal; but, Sir, I believe this subject is most intimately connected with the cause in which you are engaged. Improve the taste and elevate the minds of farmers' daughters, and you will soon remove one of the greatest difficulties in the way of agriculture and horticulture. The greatest obstacle to be overcome, I imagine, is the want of an active, enquiring mind among the mass of farmers. From want of early training and proper example, the minds of the majority have grown up in habits of thoughtlessness, or become blinded by ignorance or prejudice, so that you cannot arouse them to effort or convince them that improvement is desirable or possible. It is therefore to the younger portion of the community that you must look with the fullest hopes of success. Let the rising generation of farmers be properly educated—let them have mothers and sisters who will early teach them to think—let their minds be so trained, that they will become intellectual, thinking, reading farmers, and there will be little difficulty in the way of improvements, or in reforming the evils which exist in our land.

But first of all it is necessary, as we have seen, that farmers, who constitute three fourths of the community, should give their daughters a better education.—By this I do not mean that all should have more schooling, although that is necessary with many, but that they should have such mental culture as will fit them to fill their stations in life with pleasure to themselves, &

be a blessing to all around them. It is a most ruinous mistake for young persons to suppose that attending school for a few years is getting an education. A very important part of our education is obtained before we enter school, and much more after we have left.—The duty of the school teacher is only to unlock the gates of knowledge and direct us a few steps in the path where we may travel on, by our own efforts, and gather the flowers and fruits of wisdom with our own hands.

But I have already occupied too much space for this time, and will therefore close with a promise that in my next I will endeavor to show that there are some radical defects in the present system of educating farmer's daughters.

Very Respectfully, &c.,

ANNETTE.

Maple Grove, 1840.

NATURE.

BY ROBERT C. WATERSTON.

I Love thee, Nature,—love thee well—
In sunny nook and twilight dell,
Where birds, and bees, and blossoms dwell,
And leaves and flowers;
And winds in low sweet voices tell
Of happy hours.

I love thy clear and running streams,
Which mildly flash with silver gleams,
Or darkly lie, like shadow dreams,
To bless the sight;

While every wave with beauty teems,
And smiles delight.

I love thy forest deep and lone,
Where twilight shades are ever thrown,
And murmuring winds with solemn tone,
Go slowly by,
Sending a peal like ocean moan,
Along the sky.

I love to watch at close of day,
The heavens in splendor melt away,
From radiant gold to silver gray,
As sinks the sun;
While stars upon their trackless way,
Come one by one.

I love, I know not which the best,
The little wood-bird in its nest,
The wave that mirrors in its breast,
The landscape true,
Or the sweet flower by winds caressed,
And bathed in dew.

They all are to my bosom dear,
They all God's messengers appear—
Preludes to songs that angels hear—
Mute prophecies—
Faint types of a resplendent sphere
Beyond the skies!

THE MORNING OF SPRING.

Once more the genial sun appears,
His bright beams glance from hill and stream,
And all a chastened radiance wears
Where winter in his path has been.
I love to see the first sweet smile
That lightens up the joyous wood—
It hath a spell that can beguile
The spirit of its solitude.
And oh! to feel the southern breeze
Fan from the brow the flush of care,
To list the music in the trees,
Which its warm breath is waking there,
Hath more to cheer the spirit's gloom,
To check the all unbidden sigh,
Than all the pride of summer's bloom,
Or radiance of its golden sky.

A oyster is the human heart,
A mystery are its secret tones,
That waken only to the touch
Of NATURE's magic hand alone;
And then a thrill of kindred feeling
Bursts o'er the soul with rapture's spell,
And sorrow flies its rich revealing,
Yet whence it is we cannot tell,
But thus we know, that lone and sad,
We feel it—and our hearts are glad.

White Pigeon Republican

Victoria regalis.

Dr. Robert Schomburgk, a German naturalist, travelling on account of the Royal Geographical Society, and patronized by the English Government,—has discovered in British Guiana, a plant, * so different from all others that are known, and so magnificent, as to favor strongly of the marvellous. He has furnished the following account:—

"It was on the first day of January [1839] while contending with the difficulties nature opposed to our progress up the River Berbice, that we arrived at a point where the river expanded, and formed a currentless basin,—some object on the southern extremity of this basin, attracted my attention. It was impossible to form any idea what it could be; and animating the crew to increase the rate of their paddling, shortly afterwards we were opposite the object which had raised my curiosity. A vegetable wonder!—all calamities were forgotten—I felt as a Botanist, and felt myself rewarded. A gigantic leaf, from five to six feet in diameter, salver-shaped, with a broad rim of a light green above, and a vivid crimson below, resting upon the water. Quite in character with the wonderful leaf, was the alternate tint, from pure white to rose and pink. The smooth water was covered with them, and I rowed from one to the other, and observed always something new to admire. The leaf on its surface is a bright green, in form almost obiculate.—Around the whole margin extended a rim from three to five inches high! on the *inside*, light green, like the surface of the leaf; on the *outside*, like the leaf's lower part, of a bright crimson."

A colored engraving of it is copied into the (London) Horticultural Magazine, and the editor gives this additional information:—

"The stem of the flower is an inch thick near the calyx, and studded with elastic prickles. The calyx is four leaved; each [leaf] upwards of seven inches in length, and three inches in breadth. The diameter of the calyx is from twelve to twenty-three—on it rests the magnificent flower. When it first opens, it is white, with pink in the middle, which spreads over the whole flower the more it advances in age, and it is generally found the next day of a pink color. It would appear that the higher this gentleman advanced up the river, the more gigantic they became; and he says they measured a leaf which was six feet five inches in diameter, its rim five and a half inches high, and the flower fifteen inches across."

It is said the Loddiges of Hackney have this most extraordinary plant already in their collection. †

* Named in honor of the British Queen.

Beet Sugar Experiment.

A farmer from Genesee county, whose name we have mislaid, gave us a verbal account of a small experiment which he tried the past season, in making sugar from beets.

He took two barrels full (about 5 bushels) of yellow and white sugar beets to a cider mill, and ground them, and pressed out of them a barrel of juice. This he boiled down in the same manner as for maple sugar, and it yielded twenty pounds of good sugar. A little milk and the white of an egg was put into the syrup to clarify it; but the sugar was of a dark color, and evidently requires some other process to purify it.—He is convinced that beet sugar can be made with profit by common farmers, without any other apparatus than a common cider mill and press, and two kettles. He intends to try a larger quantity this year, and hopes to succeed in making a better quality of sugar.

If any of our correspondents can inform him of the proper manner for clarifying the sugar, it would be esteemed a favor.

Caking of the Bag, or Udder.

In newly calved cows, the udder sometimes hardens or cakes, (as it is called,) and a remedy should be applied without delay. One of my cows, in this condition, was lately treated with *soft soap*, externally applied in the evening, and the next morning she was well. I have heard no complaint of her since.

A FARMER.

Gold Vine Peas.

This name was given to a small variety of field Peas in Canada, which it was certified would not *mil-dew*. A quantity of them were imported last spring, and sold at the Rochester Seed Store, and we believe We have not learned that any of them were injured by mildew. In one or two instances they were sown rather late in the season; and, in order to test them, some common peas were sown by their side; the result was, the gold vine peas produced a good crop, while the common were not worth harvesting. It is certain, that they are a very good field Pea; and those who wish to sow them can obtain imported seed at the Rochester Seed Store.

Chopping Hay.

The following is a statement of BENJAMIN HALE, proprietor of a line of stages running between Boston and Newburyport. It is a correct statement of the saving made by the use of Straw Cutters in preparing the food for his horses.

"The whole amount of hay purchased from April 1, to Oct. 1, 1836, (six months,) and used at the stage stable, was
 At \$25 per ton, (the lowest price at which hay was purchased in 1816,)..... \$800 01
 From Oct. 1, 1816, to April 1, 1817, whole amount of hay and straw purchased for, and consumed by the same number of horses, viz:
 T. cwt. qrs. lbs. Cost.
 Straw 11 13 3 10 \$160 22
 Hay 13 14 1 00 \$350 00
 \$510 23

Deduct on hand, April 1, 1817, by estimation, four tons more than there was Oct. 1, 1816, at \$25 per ton, \$100 00 \$410 23

Saving by the use of Straw Cutter, four months of the last six months, or the difference in expense in feeding with cut fodder and that which is uncut 389 77

Whole amount of hay used for the horses of the Salem stage, twenty-five in number, from April 1, to Oct. 1, 1816, viz: At thirty dollars per ton, (the lowest price in Salem,) \$660 00

Whole amount consumed by the same number of horses, from Oct. 1, 1816, to April 1, 1817,
 T. cwt. qrs. lbs. Cost.
 Straw 15 13 0 0 \$187 50
 Hay 2 15 0 0 \$ 81 00

Saving in using chopped fodder five months,..... 391 20

Total saving in using the Straw cutter nine months, viz: at Newburyport, four months, 389 77
 At Salem, five months,..... 391 20

Total,..... \$780 97

To Preserve Fence Posts, &c.

It is often the case where lime is used for plastering and other purposes, the siftings and refuse are thrown away as useless. But it is better economy to put it around fence and gate posts, as it will greatly preserve them from decay. Leached ashes are very good for the same purpose. If slacked lime or leached ashes were sprinkled over the wooden pavements in our cities when first put down, it would render them much more durable than when sand or gravel alone is used.
 S. S.

Women Milking.

Thirty years ago it would have been almost as difficult to find a man milking as to find a woman mowing, excepting in cases of very large dairies. In this respect matters are greatly changed: and any hope, for aught we see, of getting back to the old practice, would be vain. Half of the young girls, now-a-days, hardly know, at least they would pretend that it would

be immodest and not at all lady-like to be presumed to know, whether the milk comes from the udder or the horns. "The rosy milk-maid," the title of a song which we remember to have heard when a boy, is an animal not known in modern natural history; and to a young lady with thick shoes, a checkered apron, her sleeves turned up, and a handkerchief tied over her head, though the apron should be as clean and the handkerchief as white as snow, and never so pretty a pair of black eyes and ruddy cheeks peeping from under it, it would be an idea too shocking for one of our modern exquisites even to dream of; and if presented to her abruptly, while looking in the glass, in her *moulin de laines*, with her satin shoes, her gilt hair comb, her paste earrings, and her insect waist, as crooked as the limb of a scrub oak, she would probably not recover from the fright for a week.

We say we have no hope of recovering the good old habits of former days. Revolutions never go back.—Yet in this respect we have lost a great deal. Men are seldom neat enough in their habits to be trusted with milking. They have not patience to wash their hands or to wash the udder before milking. They are not gentle, and often abuse the animal by their kicks and tumps. They are in a hurry in the morning to get through a business which they dislike; and they come home tired at night; the cows are unnecessarily milked at an unseasonable hour; and the business is very often badly performed. Women, on the other hand, are more patient, more gentle; more neat; and we were about to say—they ought to do the milking. The morning air would be bracing to their muscles, (if the modern girls have any muscles, for there begins to be a reasonable doubt in this matter;) and the odor of the cow has been long known to be, and is of n recommended by physicians as medicinal. But we will not say what we were disposed to say, because it would be useless. It is utterly vain to attempt a contest with fashion; for according to Franklin's proverb, "he that spits against the wind spits in his own face." We must, however, be just; and in riding through Dedham last week at the close of the day, it was quite refreshing to see in at least four cow yards, woman in her appropriate sphere; and by her pleasant looks and gentle conduct as she sat at the side of the bountiful cow, evincing her gratitude to Providence for the riches of all the benefactors which Heaven has given to man in the form of a quadruped.
 —N. E. Farmer.

How long will sheep live buried in snow?—We are informed by Mr. Perbam, of Athens, that during the late snow storm two of his sheep were buried beneath a drift near the barn, and remained in that situation nine days and ten nights. They were missed at the expiration of the tenth day, and found by accident, some of the cattle having travelled over the drift, and by stamping, made a breach in the snow bank, by which the animals were discovered.—One of them, on being released, immediately went into the yard, and commenced eating, as though nothing had happened—the other was a little dumpy, and did not so readily realize the value of liberty.—*Bellows' Falls Gaz.*

Weight of Snow.—It has been demonstrated in Baltimore that a cubic foot of snow well saturated with water, will weigh 30½ pounds—and that there was at one time [23d of December] on one of the large churches in that city, fifty-five tons of snow, the depth being ten inches, computing it at only 16 lbs. to the cubic foot. People are not generally aware of the danger of having buildings crushed with large bodies of snow upon them.

How many young ladies are there who would be martyred to the last degree if a frill or a collar, or other parts of their dress were misplaced, but who, on being detected in ignorance even in the history of their own country, would own it without a blush?

What will you have?—As a person once agreed to produce the weather that might be unanimously proposed by the audience, so we agree to furnish the kind of reading which may be decided upon by a general convention of readers. In the mean time, we shall continue to vibrate, as we have done, over a field of variety, and thereby come in contact with the favorable tastes of many. Reader—do not condemn that paragraph which finds no favor in thine eyes; but pass it over to him for whom it is prepared;—you must not monopolize. It requires some genius to read a paper scientifically, as well as to make one.—N. Y. Sun.

¶ A FATHER WISHES ANNETTE WOULD give his daughters some hints on Industry and Economy, during these hard times.

Razors, Shaving, and Improving Cutting Instruments.

There are but few farmers who are not more or less interested in the operation of cutting the beard. This, we hope, will be a sufficient apology for introducing an abstract of a communication, which appeared some time ago in the Farmers' Register, from the pen of Dr. Robert R. Harden; believing that some of the positions advanced deserve further investigation. The fact that a warm razor cuts better than a cold one, is commonly known; and the reason is supposed to be the same as that a hot knife cuts butter more easily than a cold one. It is also a very common opinion among mechanics that an *old* tool cuts better than a newly made one. But the improvement of the temper by magnetizing is entirely new to us. If such is the case, may it not be owing to the improved tenacity of the edge?

Dr. Harden says that the loadstone improves a razor to an astonishing degree, and that therefore the first step towards taking off the beard easily, is to magnetize the edge. With regard to its shaving more easy when dipped in hot water, he says, "It cannot be from its softening effect on the beard; for after the beard has been well lathered with soap and warm water, it is hardly presumable that the heat of the razor would soften it much more. Besides, the razor will not shave so well if it is *too hot*; to shave easy, it must be dipped in hot water, and then getting cool before it is applied to the face. Two reasons should be given; first, because when the razor is used cold, the temper is so high and the edge so fine, or thin, that it will fly and become full of little gaps; whereas by dipping it in warm water, the heat gives it a little toughness, and takes away that extreme brittleness which makes it break. Shave with a razor that is hot and one that is cold, and examine them with a powerful microscope, and the difference will be very plain. In dissecting out large tumors, and other surgical operations, where very sharp knives are required, I have always kept the knives in a bowl of hot water, and changed them as they became cool."

Dr. Harden relates a number of interesting experiments, rather accidental, showing how the temper of steel is improved by age. He says newly tempered steel is always defective—that it is the common belief among surgeons, that old London instruments were better made than they were in this country; "that they are better is certain; but it is age that has improved them." He relates, among others, the following occurrences:—"More than 25 years ago, I had a set of dissecting knives, made by Brown, of Philadelphia.—He was directed to make them as good as they could be made, and to charge double price for them. They were found, upon trial, to be good for nothing, were thrown aside, and after remaining for many years neglected, I had the rust cleaned off and sharpened.—They are now as good as the best I ever used. About twenty years ago, I had a couching needle made of a singular form, by a blacksmith. The operation of couching for blindness requires a well tempered instrument; the point must be perfect. After having it several times tempered over, I found it impossible to bring it to a perfect point. It was thrown aside as useless; not less than half a dozen times I sent to the north and had new needles made, directing two or three prices to be offered for them, so that they might be made of the best kind; none of them were as good as I wished them to be. As I frequently practice this operation on dead eyes, as well as on brute's eyes, to save my new instruments, this old needle was cleaned of rust and sharpened again; and upon trial, it was found to be the best instrument I have." "It may be laid down as a fact, that a newly made razor will seldom shave well, and that the older the better.

Time or age, has an effect on the edge of a razor, that no art can produce. * * * Therefore, when we buy a new razor, (for this new razor may have been made years,) we should select a sharp one, for we may never get as good an edge on it again; this edge should be saved as long as possible, never putting it on a strap while it will do without. By only strapping it on a clean silk handkerchief, or the palm of the hand, if the razor is a good one, it will keep its edge a long time."

The communication contains minute directions for sharpening razors after they have lost their edge. The hone must of course be good; a very fine oil stone is said to be best, and castor oil better than olive oil.—We are told that a good razor can never be well sharpened while cold, from brittleness; that it should be dipped in boiling water, and laid on the hone with little more than its own weight, and instead of having a rough, broken, and irregular wire edge, it will have a fine, uniform wire edge. To attempt to strap this off, breaks it irregularly, and sticks the strap full of fragments which spoil it; rubbing it across the thumb nail, breaks it off in some places, and turns it up and makes it worse in others. Time is the only remedy. Therefore after honing it, wipe it perfectly dry, not touching the edge with any thing, and above all things not touching it by a strap; and put it away. After remaining at least three months, the longer the better, strap it some time on a stretched silk handkerchief, then on the palm of the hand. This should be done cold. "Now dip it in boiling hot water, and apply it to the smooth side of one of Mechie's magic straps, lathering the face, and dipping the razor in hot water as usual; and the beard may be mowed off, not only so easily that it cannot be felt, but the razor will shave so perfectly easy and smooth, that it will shave the beard *lower than the surface of the skin*. It is absolutely necessary to dip the razor in boiling water while strapping as while honing it." There are a number of theoretical, or rather hypothetical remarks, which we omit.

Should any think we have devoted too much time to this subject, we can only say, that the aggregate time which many farmers spend in shaving their faces during life, is about one entire year; and that the amount of time consumed annually at this business by all the farmers of the State of New-York, cannot be less than one thousand years, or three hundred thousand dollars worth of time. This we hope is some apology.

From the Farmers' Cabinet.

Farm Accounts, and Farm Profits.

Mr. Erbron—I was much pleased with the communication in your last number, from A. E. T., of Philadelphia county; and I am glad that an article so plain, interesting, and calculated to place the profits of agriculture in a fair light, is to be followed up, as I infer from the heading of the article, which is No. 1.—Now, I do hope that this writer, who, it appears, can hold the pen as well as the plough, will continue his essays for the benefit of his brother farmers. There are many subjects of great interest to the farmer, that have as yet received little or no attention from agricultural writers. The subject of *Farm Accounts* is one of great importance, and I trust that A. E. T. will furnish us with a "bird's eye view" of his system, which I presume is a good one.

The system or practice of farming with us in Montgomery county, is not essentially different from that in the more immediate neighborhood of Philadelphia—but our great error has consisted in not farming *well* enough; we have been too anxious to have large farms, even if partially cultivated, in preference to small ones in a high state of fertility. The desire to obtain many acres, has been the ruin of hundreds, and was the rock on which I was nearly shipwrecked.—Some years since, when money was cheap and every thing saleable dear, I was induced to believe that my farm of ninety-five acres was too small. True, I had lived above board, was entirely free of debt, and had abundance of employment; but still my farm was

small, very small, indeed almost insignificant in comparison with some of my neighbors. Instead of being contented with what I had, and by still greater attention causing it to produce more abundantly than it had previously, the spirit of grasping after more, ambition, speculation, or whatever you may please to call it, took full possession of my mind—of course my days of tranquility were ended.

About this time it so happened that an adjoining neighbor had become a victim to the spirit of emigration, and having settled on locating in the west, offered his farm for sale. He had been revolving in his mind the propriety of this step for several years, and as it worked upon him, his farm became more and more neglected, until, in some measure, he lost the character of a clean farmer. The buildings on the place were so old and decayed, that they were considered of no value. The farm consisted of two hundred and twenty-eight acres, subject to a mortgage of six thousand dollars, at six per cent., payable half yearly. This was no obstacle in my mind, "as the mortgage may remain for years." The day of sale came, and I was the fortunate purchaser: it being knocked down at eight thousand one hundred and twenty dollars, subject to the aforesaid mortgage. My farm of ninety-five acres, had, in the nine years that I tilled it poorly, yielded me about two hundred dollars profit per annum—so I had about eighteen hundred dollars at command, but was compelled to borrow, a thing I never did before, about four hundred dollars.

I had now attained apparently the summit of my wishes—I was now a large landed proprietor! At first, I little thought of the collar on my neck, in the shape of a mortgage, and sundry small obligations shortly to be met. I enjoyed myself finely indeed, but only for a short time, as the "bubble burst," and I awoke to the cold and sober realities of my situation. True, I was a large proprietor, but that did not give sleep to my eyelids. My six months' interest came round, and was paid after many days' vexation. My coming crops, which fortunately were pretty fair, enabled me to keep along for that time, to support my family and pay off the four hundred dollars; but it took all, and when that was gone I was in a deplorable condition. A large plantation, mostly in a bad state of cultivation, with poor fences, going rapidly to decay—the soil requiring a liberal application of enriching manures to give it life, and no money to purchase it, or to pay for sufficient help. But I resolved not to be discouraged, and though, by going into debt for various articles where I had credit, I was compelled to pay an enlarged price, yet I pushed on, resolved to do my best to weather the storm, and improve the purchase, at least in appearance, such as fences, &c. But instead of cultivating but a part, I very foolishly—as I fear is the case with too many of my brother farmers who occupy too much land—undertook to cultivate the whole—the consequence was that my crops were generally light, especially on the new purchase, and not so good, by odds, on the homestead. I saw my error, and determined, if possible, to retrieve it.—By perseverance I was enabled to continue and make both ends meet, but as to laying up a dollar, I did not and could not, and I had almost become reconciled to my toilsome and care-worn life, when I was started on a new track.

In 1836 a young man, a stranger, who was soliciting subscriptions for an agricultural paper, called at my house about evening. I bid him stop for the night, which he did. In the course of the evening, our conversation—confined as it was to agriculture—turned upon my embarrassments. Why, said he, it is the easiest thing in the world for you not only to slip the collar, but to do it to some purpose. I inquired how; he replied, *sell enough not only to pay your mortgage, but to enable you to lay in a noble stock of manure, and devote the same cost, labor, and attention on what you have left as you did on the whole, and I will guarantee you success.* But I can't sell—I have tried the neighbors for years, to no effect. But that is not the way—*advertise, yes, advertise very extensively, not only in your country papers, but in those of the city, and the surrounding country; make your farm known every where. Sell off the first chance.* He read me several articles about the profits of small farms well managed—of the great improvements in agriculture, &c.

In the morning I subscribed for his paper. He went his way, and I turned my attention to the duties of my farm. But his advice made so great an impression on my mind, that I could not rest until I had made the effort to sell in the manner he proposed. I accordingly encountered the expense; and one of the advertisements fortunately brought me a purchaser, *cash in hand*, who took two hundred acres at forty-

three dollars per acre, or eight thousand six hundred dollars; so I had a trifle left, besides twenty-eight acres of wood land. I was at once released from my trouble—but the gain—much as it may seem to some, can never recompense me for the intense suffering of mind which for years I had endured.

I promised my wife and children that if ever I got well out of that speculation, that they would never find me engaging in another; and I will preserve my word inviolate. I immediately set about arranging for future operations. I was liberal in the application of manures to my old place—my fences were all put in excellent order—outhouses repaired, and all about or around the dwelling neatly whitewashed—better accommodations were made for cattle, &c., and now the old homestead not only looks as pleasant as ever, but is the abode of real contentment and rural enjoyment.

But this is not all—reading my agricultural works has stimulated me to keep pace with the improvements—and what is a mystery to some of my neighbors is, that now, on the old "ninety-five," as they call it, I raise more saleable or disposable produce than I ever did, with the addition of the large farm. This is a fact. But is easily explained; the three hundred acres were partially cultivated—the homestead is now in the highest state of fertility, and I have, from the free use of lime, been under the necessity of contracting for an additional barn on the premises. Before I purchased the addition, I laid by about two hundred dollars a year, but when I cultivated the whole I could scarcely make both ends meet. Now I am, thank Providence, doing better than ever. "I am doing well, and intend to let well enough alone," and not be led away by a spirit of emigration, the mulberry mania, or the making of beet sugar. I shun these things as I would a pestilence, but shall content myself with raising the sugar beet for my stock, which is increasing, satisfied that nothing is better calculated for them, or more advantageous for the farmer—the stock farmer especially.

Now I am going ahead without keeping accounts, save certain memorandum books. I feel the want of a correct system, and I hope that your correspondent, "A. E. T.," or some person competent to the task, will furnish, through the Cabinet, the information desired; for I consider it almost as important for the farmer to have a correct system of accounts, as it is for the merchant or mechanic. J**** J****.

From the American Farmer.

The Preservation and Use of Roots.

On this subject our readers could be referred to no better authority than Mr. Barney, the emigrant grazer. His experience is as extensive as his judgment is sound—His name kindles up agreeable associations in our mind—He was among our chief counsellors and friends in getting up the American Farmer more than twenty years since, when it was a matter of doubt whether we could get interesting materials or adequate patronage, for a weekly paper, devoted exclusively to Agriculture and Horticulture. A reference to the pages of the first volume will show that Mr. Barney cast much light on the untrodden path, and enabled us to publish many things calculated to awaken attention to what had been, and what still might be, done to improve the common practice in matters of agriculture, and that very interesting branch of it, rearing, grazing, and fattening domestic animals.

His testimony in favor of root culture as subsidiary to rearing of cattle and sheep, and preparing them for the market will go far to augment the disposition in every quarter to extend the culture of roots, as evinced by our correspondence. We anticipate more improvement in this branch of American Husbandry within the next few years than in any other, and feel convinced that no judicious husbandman, having once enjoyed the benefit of a good supply of roots for his cattle and sheep for the winter, will ever after forego its advantages. But to the extract from Mr. Barney's letter.

PHILADELPHIA, Feb 24, 1840.

J. S. Skinner, Esq.

DEAR SIR—I was truly pleased to find that you had taken up your old task, and become the Farmer's and Grazer's guide. I have not forgotten the good gone-by times in which you and I held consultation respecting commencing the good work of the first volume of the American Farmer. Well do I remember the hospitality received at your mansion house, in company with your good lady and two little sons; and although I have now advanced to between three score years and ten, gratitude speaks louder than words.—One little article which you published in the first volume of the American Farmer, and I have no doubt you were the author of it, and wrote it down with

your own pen, I hoarded up in my mind and put in practice, and it has been a source of profit to my calling to this day; and I have thought the least I could do was ever to continue a subscriber to this useful publication—I have thus far done so, and paid up all my arrearages, and at this needful time I send you a little of the needful, \$5, in payment for this present and the next volume of the Spirit of the Agricultural Journals of the day, with the request, you will in future direct my paper to Port Penn Post Office, Delaware.

I commenced last year to improve a large tract of marsh land on the river Delaware, about three miles below my former residence, and if spent a little longer, intend spending most of my time there. I want to give you a few hints on my success in raising and manner of preserving and feeding the good Roots, the sugar beet in particular, mangle wurtzel and ruta bage. I succeeded in raising a large quantity last season of all the three kinds, and fed them to a large number of cattle, sheep and horses; they are incalculably valuable to all kinds of stock, judiciously fed. I use them as follows:—Cut hay of the very best kind, oats in the sheaf, the roots chopped fine, a small quantity of Indian meal and oats ground, two-thirds oats, and one-third Indian meal or bran, a small proportion of pure water just to make it moist. I preserved them in a large stone wall cellar, commencing as follows:—Provided a number of cart loads of sandy lime, placed it so as to be handy, placing my beets three tiers thick against the wall all round the cellar, between every stack of beets a little of the lime sand, and so on as high as a man could pack them, the middle of the cellar left for the turnips. I have been taking them out ever since the middle of December, from five to six bushels per day, and expect so to do till grass takes their place; as my ewe sheep begin to lamb, I expect my roots will allow me to increase the number of bushels per day. In warm weather I open my cellar doors and windows, but am careful in having them closed in cold frosty nights. In this manner I have preserved my roots for several years, and I feel persuaded it is worthy of patronizing. I wish you much success in your useful calling.

Yours, most truly,
JOHN BARNEY.

On Stripping Cows.

WINTER PRODUCT OF A DEVON COW.

Every milk-maid has been cautioned that the last milk yielded by the cow, at any one milking, is richer than that which is first obtained—but this is not the only consideration which shows the importance of thorough milking. The more there is left in the udder, the less will the cow give at subsequent times, and the sooner will she 'go dry.' After once going through the cow pen, the milk women, or man, for in New-England the men milk the cows, ought to be compelled to go round again and completely strip each cow.

The importance of this will be better understood if there be truth in the statement which we have lately read, apparently on good authority. We confess we were not prepared to believe that the difference was so great as there stated, between the first and last portion of the one milking. The statement is that—

Several large coffee cups, having been successively filled from one cow, till she was quite dry, the following results appeared, great care having been taken to weigh the cups when filled, to ascertain that they held exactly the same quantity.

In every case the quantity of cream was found to increase, in proportion as the process of milking advanced. In different cows the proportion varied, but in the great number the excess of cream in the last cup, as compared with the first, was sixteen to one! In some it was not so considerable, therefore as an average it may be called as ten or twelve to one.

The difference in quality of the two sorts of cream was no less striking: the cream given by the first drawn milk, was thin, white and without consistence, while that furnished by the last, was thick, buttery, and of a rich color.

In the Philadelphia Farmers' Cabinet, we have the WINTER PRODUCT OF A DEVON COW.

Abraham P. Holdrich, of Spencertown, had an accurate memorandum kept of the butter made from a Devonshire cow, which calved last autumn. The result was, that from the tenth December to the 10th January, including both days, there was made from her milk 56 lbs. of well worked butter, nearly equal to two pounds a day. The cow was fed with roots, hay, and buckwheat bran. Estimating it at 25 cts. a pound, the butter made in the depth of winter was worth \$14, and we consider this the average product of eight months in the year, the aggregate amount for that period would be \$112.

This shows the importance of keeping a good breed, and of keeping it well—Like cultivating rich land instead of poor—it takes no more labor to milk and take care of a good cow than a bad one.—Am. Far.

Rearing Calves on Milk and Meal.

MESSRS. EATONS—In the last number of the Cultivator you published some remarks of mine on the mode of feeding calves by Mr. Hearsey, by giving skimmed milk with some meal, &c.

Mr. Hearsey says that it is necessary to explain the manner of mixing the meal—that if the raw meal is put into the milk it will scour the calf. He makes the meal into souppan, heats the milk over steam to the state of its coming from the cow, and then mixes about one pound of the cold souppan in the milk, and feeds the animal in this way three meals a day. His calves thus fed, at the end of the year are more than double the size of those calves that suck the cow.—He now makes 12 lbs. butter a week from two cows, and uses six quarts of milk daily from the same cows.

He adds a pint of boiling water to a pan of milk when set, holding six quarts, and the next day the cream will all be floating on the top, and skimmed off and churned.

DAVID TOMLINSON.
Scheeclata, March 10, 1840. [Cultivator.

Preserving Hams for Summer use.

MESSRS. GAYLORD & TUCKER—As the time is now come to put up hams to be kept for summer use, I will now state to you my mode. I believe we have tried all the methods in practice, and must prefer the one here described.

We take a dry cask or box, say an old flour barrel, put a good layer of coarse salt in the bottom, and then put down a ham; cover that with coarse salt, and put down another ham, and so on till the cask is full or the hams all deposited. Set the cask in a cool, dry place, and whenever a ham is wanted, take it out, and it will be every way as clean, clear from vermin and all other impurities, as when put down. This is attended with very little trouble or expense, as the salt is not at all injured for any other use in the fall. My cellar being a very dry one, we put the cask of hams in a cool place in that; but a damp cellar would be apt to dissolve the salt. The hams should be well dried before being put down.—[lb. Yours,

CALVIN BUTLER.
Plymouth, Conn., March 14, 1840.

Successful Farming.

MESSRS. GAYLORD & TUCKER—I think I have been very successful in farming the last year, and will give you an account of the different crops I have raised and their product from 38 acres of limestone land. I do not mean to boast of raising more from an acre than other farmers, or of having raised any very superior crops; but on the contrary I am aware of having committed many errors in my system of farming, and am convinced that my crops last year ought to have been one fourth heavier, and that in future I shall increase the product from year to year above what I have raised last year.

4 acres of Barley, 180 bush.

Door Yard Scenery.

The following extract from *Loudon's Suburban Gardener*, contains so many useful hints, that we present it to our readers; more especially as the ornamental planting recommended is not expensive.

Variety in the Views obtained from the House, and from the different Walks conducted through the Grounds, is one of the grand desiderata in every place laid out in the modern style, whether its extent may be large or small. With respect to the views from the house, the first thing to be attended to is, the disposition of the rooms, so that their windows may look in different directions. Unless this has been studied by the architect, it will be impossible, even in the finest situation, to produce much variety in the views.—Suppose a house placed on a slope, commanding an extensive prospect; if all the rooms looked towards that prospect, all of them would have good views, but these views would not be varied; whereas, if, from one side of the house, the windows of one room (say the drawing room) looked out on a level flower-garden; and if, on another side, those of the dining-room looked up the slope; while, on a third side, those of the library, or breakfast-room, commanded the distant prospect; there would be three distinct characters of view. Now, in very small places (say a quarter of an acre, or even less, in extent) this varied disposition of the rooms, or, rather of the manner of lighting them, ought never to be lost sight of; because, altogether independently of distance, or of any object beyond the boundary fence, the views may be rendered of different characters by the different kinds of trees and shrubs planted, by their different disposition, by a difference of form in the ground, and by a difference in the architectural ornaments, or by the absence of architectural ornaments altogether. Even a difference in the form and size of the window, or the absence or presence of a balcony or veranda, will altogether alter the character of the scenery. Wherever, therefore, a house stands isolated, and has a clear space of a few yards on each side of it, it may always have at least four different characters of view, independently of the effect produced by balconies, verandas, or other changes in the windows or foreground. Hence, also, in limited plots of ground, whatever is their shape, greater variety of view will be produced by placing the house nearer one end, or nearer one side, than in the centre. In the latter case it is impossible to get depth of view from any side, and thus a great source of beauty is lost. A deep view includes a greater number of objects, and, consequently, admits of a greater variety of effect of light and shade; it increases our ideas of extent, and, by concealing more from the eye than can be done in a confined view, it gives a greater exercise to the imagination. Add to this, that, in a small place, depth of view is not expected; and, consequently when it does occur, its effect is the more striking, by the surprise it occasions, as well as by its contrast with the other views, which must necessarily be very limited. In fig 45, a is the house, placed at one side of a plot; b, the drawing room, having a view the whole length of the garden; c is the dining-room, having a very confined view, and, in short, looking across some bushes, to a screen of evergreens (say hollies or evergreen oak); d is the breakfast-room, or common sitting-room of the family, looking on a flower-garden, to which there is a descent from a balcony by three steps. The other small room may be used as a business, waiting, or gentleman's room; and the

situation of the staircase is indicated. The central hall is large for the size of the house, and may, in summer, be used occasionally as a music-room, or as a play-place, or dancing-room, for children. All the offices are on the basement story, and the first and second floors are bed-rooms. If the garden were larger, or even of its present size, if circumstances were favorable, a small piece of water, supplied from a dripping rock at e, would have a good effect; and there might be a statue on a pedestal, surrounded with tazza vases of flowers, in the centre of the flower garden; or, if water were abundant, a fountain might be substituted for the statue. The rest of the garden, with the exception of the surrounding border between the walk and the boundary wall, is entirely of turf, varied by choice ornamental trees and shrubs, including some fruit trees and fruit shrubs. The standard roses, and the fruit shrubs, such as gooseberries, currants, raspberries, vacciniums, &c., of which there cannot be more than two or three plants of each kind, stand in small circles, kept dug and manured, in order that they may produce their flowers and fruit of good size; but the mulberry, the quince, the medlar, and the few apples, pears, plums, &c., for which the space can be afforded, may stand on the grass. Against the walls are planted one or two peaches, nectarines, and apricots; and against the house, a fig tree and a vine.—The remainder of the walls and of the house may be varied by roses and flowering creepers; except the more shady parts of the surrounding wall, which may be covered with the common, the giant, and the variegated ivy. The surrounding border between the wall and the boundary walk is wholly devoted to bulbs, in spring and the beginning of summer; with a row of Russian violets inside the box, for producing fragrance in winter; and patches of mignonette at regular distances, to scent the air during summer. Among the groups of trees, and close by their roots, common cowslips, snowdrops, wild violets, and wood anemones may be planted to come up among the grass; and, being only planted in a few places, and these near the roots of the trees, they may be easily avoided by the mower. In such a garden as this, small though it be, a great variety of trees and shrubs might be grown; and the flower garden is sufficiently large to produce a very good display of the finer kinds of hardy flowers.

Inquiries—Heaves in Horses.

MESSRS. EDITORS—Have you, or any of your subscribers, noticed that there are more horses than usual troubled with the heaves this spring? If so, what is the cause?

If any know of a cure, they will confer a favor on the public by making it known through the columns of your valuable paper. SOUTH WEST.

Cure for Garget—Inquiry.

MESSRS. THOMAS AND BATEHAM—I have a cow which is nearly ruined by the Garget. Can any of your correspondents inform me how to cure her?

Yours, &c., E. F. M.

Yellow Water in Horses.

I have tried with complete success the following cure for this dangerous disease:—Take half a gill of spirits of turpentine, half a gill cane molasses, and one gill fourth proof rum; mix them well together in a bottle. After taking it the horse should be kept from water twenty hours. S. N.

To Post Masters, Agents, and Others.

Those who have not remitted the amount due for subscriptions, are respectfully requested to make an effort to increase the amount, and remit without delay.—If New York or Eastern money cannot be had, send the best that can.

CANADA AGENCY.—The Postage on letters from Upper Canada has been a sore tax upon us, and at our solicitation, the Post Master at Port Hope, D. Smart, Esq., has kindly consented to act as General Agent for us. We therefore request all Post Masters and others in that province, who wish to order the paper or make remittances, to do so through him, and he will transmit to us by steam boat, so as to save expense on both sides.

To the Friends of Agriculture in the Genesee Country.

This number of the New Genesee Farmer completes the first half Volume; and the publishers offer their sincere thanks for the efficient aid which many friends of the cause have rendered them in the undertaking. We regard the successful establishing of this paper, as a proud triumph on the part of the farmers of Genesee, over ignorance, prejudice, and opposition. At the same time, we are sorry to say, we feel the full force of opposing influences from many quarters, and our friends must exert themselves anew in order to insure complete success.

We have still on hand some thousands of back numbers, which we hope to see speedily disposed of to new subscribers, by the assistance of our friends and the "Genesee Agricultural Society," a resolution of which we recommend to the attention of our readers. The paper has now been six months before the public, and has received the most unqualified approbation from those who have examined its pages; so that we feel a right to ask our readers and all who wish the cause success, to make some effort to circulate the present edition, and place the paper on a permanent footing.

BATEHAM AND MARSHALL.

Culture of Fruit.

Believing it will not be unacceptable to our readers, we purpose to devote a little space to remarks on some of the varieties of fruit, with the cultivation, propagation, diseases, and enemies to which they are subject. With comparative few exceptions, almost nothing has been done in this region by farmers and others, towards supplying themselves with the best kinds. We have known very intelligent men, who did not seem even to have ever seen the finest varieties, and who cultivated largely very inferior ones, believing them to be the best, known in the country. To introduce more generally the finer fruits, and to facilitate their culture, is our present object.

Much is said of the productions of tropical climates, and of other countries; but there is every reason to believe that the fruits of our own country, and of this part of it, are not inferior to any. The reputation of the fruits of other countries, is in a great measure owing to the privations and hunger of the travellers who describe them. A keen appetite, rarely gratified, adds greatly to the flavor of inferior productions. Our resources at home, if but known, would be much more highly appreciated than they now are.

By a selection of proper varieties, good fruit may be had throughout the year; and during a large part of the time many highly delicious ones will be afforded. The apple alone, will fill the yearly circle, if early, long keeping, and intermediate varieties, are properly selected. Pears afford a succession of delicious fruit through the latter part of summer and the whole of autumn, and by a little care, till spring. Peaches may be made to furnish a constant supply from the middle of summer till frost. Apricots ripen through the course of one month or more in the middle of summer, furnishing a fruit but little inferior to the peach, and at a season before the larger ones appear. Strawberries, raspberries, cherries, and several others, fill up the early part and middle of summer.

We shall briefly notice a few, among many, of the best and most desirable varieties.

Among apples, the *Yellow Harvest* is one of the best early varieties. When fully ripe, it is a yellow, flatish apple, of medium size, somewhat acid, of a fine flavor, and ripens about the time of our wheat harvest. It is a good bearer, and should be in every collection of fruit trees, however small. *Woolman's Early*, is similar in shape, rather smaller, is shaded, or clouded, (not striped) with purplish red, of a delicate and rather breaking texture, and of a slightly acid and agreeable, though not uncommonly rich flavor.—The fruit ripens from wheat harvest until a month later; the ripe fruit is distinguished by a change of color from green to red. The *Early Sweet Bough* is well known, and is one of our most valuable varieties, not only on account of its great excellence, but its uniform productiveness. *Buffington's Early* ripens two or three weeks after the *Yellow Harvest*, and is remarkable for its delicate texture and its very fine sub-acid flavor. It is flat, nearly white, with a very slight bluish next the sun. The *Summer Queen* is rather too acid for most palates, but is the best early apple for cooking, being of a remarkably rich flavor. It is a good bearer, the fruit somewhat conical, and striped with orange-red. The *Strawberry* apple, which ripens early in autumn, is unsurpassed by any apple we have seen as a table fruit. It is very slightly acid, of fine texture, juicy, and of an exceedingly agreeable flavor. It is of medium size, its shape is oblong-conical, and is striped copiously with dark red. The *Full Pippin* is one of our finest autumn and early winter apples, is often very large, weighing frequently a pound, and in rare instances, has weighed nearly a pound and a half. When ripe it is yellow, and of a fine very slightly acid flavor. It is liable in unfavor-

able seasons, to spots of mildew, which diminish its size. The *Spitzenberg*, *Rhode Island Greening*, and *Tollman Sweeting*, are well known, and are among our best winter apples. The *Swar*, though common, is less known, and is hardly equalled in quality by any winter apple. Many consider it superior to all others. The *Bellflower* is of first rate excellence, quite acid, very rich in flavor. It is oblong, and conical at the apex, yellow, and when well grown, rather large in size. The flavor of the *Norton Pippin* is hardly equal to many others, but it keeps well till spring, and retains in a remarkable degree its freshness at that period. The *Roxbury Russet*, though hardly of first rate excellence, possesses eminently the quality of keeping, and may be preserved without difficulty till mid-summer. Those who wish to preserve apples a long time, would find it much easier to procure and raise this variety, than to waste their time and efforts in endeavoring to keep our more common varieties.

The introduction of European apples into our country has proved in most cases of little value. Many fine varieties appear to lose in a great degree their valuable qualities, by the change of climate. A few, however, among many imported varieties, we have found to be excellent and worthy of cultivation. Among these may be mentioned the *Alexander's Gravenstein*, and *Ribston Pippin*. But still they do not equal our best native varieties. The *Swar* and the *Spitzenberg* still stand pre-eminent.

Most of the varieties which we have just mentioned, are cultivated to a greater or less extent by many of our farmers. But the best among the peach, plum, cherry, &c., appear almost wholly unknown to them.

(To be Continued.)

Lettuce.

COBBETT, whom GOETZLAY stigmatized as "a quack in every thing," was a shrewd, though often an inaccurate, observer; and in reading his "American Gardener," we are sometimes surprised at his reckless blunders, and at other times pleased with the justness of his remarks. His account of the *Camellia* probably betrays more ignorance than was ever shewn by any other writer on gardening, within the same space.

Our object at present, however, is not to criticise that work at large, but to notice his paragraph on LETTUCE:—

"This great article of the garden," he says, "is milky, refreshing, and pleasanter to a majority of tastes than any other plant, the *Asparagus* hardly excepted. So necessary is it as the principal ingredient of a good salad, that it is, both in France and England, called "salad," by great numbers of people. It is good in stews; good boiled with green peas; and even as a dish boiled as cabbage is, it is an excellent vegetable."

He continues:—"I never saw a really fine lettuce in America. The obstacles are, the complete impossibility of preserving plants of the fine sorts in the natural ground during the winter; and the great heat which will not suffer these sorts to leave, if they be sowed in the natural ground in the spring."

America is as easily written perhaps, as any other name of four syllables. Cobbett's knowledge of even the United States, of which he speaks so familiarly, appears chiefly to have been confined to narrow circles round Philadelphia and New-York. The great heat of our parching summers was an idea that seemed to haunt him; and the long continued rains of a north-easter, or the refreshing coolness of the west wind after a thunder shower, appears not to have left a trace on his memory. Good lettuce, however, may be grown on land properly prepared and cultivated, at any time from Spring till Autumn, in ordinary seasons. It is a fact capable of proof to every one who has eyes to observe the weather, that one of the principal defects of our climate, is excessive moisture; and that from this cause, our crops generally suffer much more than they do from the opposite extreme. But Cobbett's notion

is refuted by the following remark of Loudon's:—

"The lettuce, unlike the cabbage and spinach, is a vegetable which can be grown to as great perfection in a warm, as in a temperate climate, provided it be grown on rich soil, and abundantly supplied with water.—Hence the lettuces of Paris, Rome, and Calcutta, are as large and as tender as those of London and Amsterdam."

In speaking of Cos lettuce, Cobbett says, "When you cut one of these from the stem, and pull off its leaves, you have a large lump of white enough for a salad for ten people. Every body knows how to sow lettuce—seed along a drill in the spring, to let the plants stand as thick as grass, and to cut it along with a knife, and gather it up by handfuls. But this is not lettuce. It is herbage, and really fit only for pigs and cows. It is a raw, green Dandelion, and is not quite so good."

We should not have suspected, that lettuce by standing too thick, change into Dandelions!—yet we fully agree that head lettuce is a superior article. To have it curly, the seed should be sown in a hot-bed; and as soon as the danger from severe frosts is over, the plants should be set out in a border thoroughly prepared. Cobbett advises "not to put them in a place full to the sun, but in the east border or the west border;" and adds, "Be sure to make the ground rich."

Loudon says, lettuce "is sown monthly, or oftener, throughout the year, in order to have a successional supply, and thinned out or transplanted to increase the size and succulency. The latter quality is greatly increased by watering in summer; and blanching, another desirable property, is promoted by tying up the leaves when the plant has attained about two-thirds of its usual size." In doing this, however, great care should be taken not to break or bruise the leaves; and not to tie them too tight which would cause them to rot. Indeed, after giving them a curling form, they can hardly be left too loose.

We wish not to interfere with the prerogatives of others, and hope that all our readers will eat lettuce in the manner that is found most palatable,—whether with sharp vinegar applied to the crisp leaf, or with cream and gravy, previously applied in a scalding state. Our method, however, varies a little from what we have seen elsewhere. We cut the lettuce fine and sprinkle it sufficiently with powdered sugar, (rejecting that which comes from unpaid labor.) Cream is then poured on, and vinegar, just enough to impart a zest. To our palate, this is delicious. Please to try it.

Ridging for the Ruta Baga.

The *Ruta Baga*, in common with most other root crops, succeeds best on a deep as well as a rich soil; and a frequent cause of the partial failure of many cultivators, is the want of sufficient depth and richness. This difficulty may, in a great degree, be obviated by ridging. This throws a large portion of the fertile surface together, and gives quantity and depth at each ridge. Ridging also proves beneficial where soils are liable to prove too wet.

As a large portion of the soil of our country is a clay loam, we would recommend those who possess such soil, except it be deep and rich, and in a dry situation, to prepare their ground for *ruta baga* as follows:—Plough ridges by throwing two furrows together, about two feet and a half apart, fill the intermediate furrows with manure, then split the ridges with the plough, throwing the earth upon and forming new ridges over the manure. Pass a roller over the whole to flatten them, and then sow the seed in drills along the tops of these flattened ridges. This treatment, with subsequent culture, can hardly fail to ensure a good crop.

Breaking Steers—Inquiry.

MESSRS. EDITORS—Will you, or any of your correspondents, inform us how to prevent steers from being sulky when breaking them for the yoke? I find it to be a very serious difficulty in learning them to work.

E. H.

Sugar Beet.

INJURED IN ITS QUALITY BY FRESH STABLE MANURES.

An article in the North American Review, on the history of Sugar, contains the following hints:—

"In 1809—10 experiments were recommenced in France, particularly by M. Deyeux, of the Institute, which resulted in the production of a considerable quantity of sugar—[but]—no more than 2 per cent. was obtained,—the beets being of a bad sort and raised in the neighborhood of Paris, where a vast deal of AMMONIACAL MANURE, hostile to the production of SACCHARINE, is used."

"In 1811, M. Drappier, of Lille, obtained 2½ per cent. of sugar. In the winter of the same year, an experiment at Paris succeeded in obtaining 4½ per cent. from WHITE BEETS, raised at a considerable distance from Paris, and without any manure."

These hints are all that I find on the subject by this writer; but C. L. Fleishmann, in his memorial to Congress on Beet Culture, says, "The beet requires a deep soil, sufficiently provided with decomposed manure, as when planted in green [fresh] manure, they yield much less sugar." He therefore recommends manuring the previous year, and planting with Indian corn and pumpkins, which are also to be manufactured for sugar.

Have we then the curious fact that "ammoniacal manure" is not "hostile to the production of saccharine" in Indian corn and pumpkins, while it is decidedly injurious to the beet? How, when, where, and by whom, were these discoveries made? and what writer has treated of the subject at large? X

Sugar Beets.

After all the eulogisms on the profit of Sugar Beets, I think I can say it is the very thing for this region, (Seneca county.) Our climate is too subject to summer drought for ruta baga to succeed every year. Potatoes suffer from the same cause. But sugar beets, even when planted on clay, (well anchored,) shade the ground so much by their large leaves, that drought does not affect them. Plant early. I have had transplanted beets grow larger than from the seed; the transplanting was done in a wet time, about 5th June, and done with care. Some of the beets weighed 9lbs. and grew mostly above ground. Ruta bagas, planted side by side, were small, and worm eaten. S. W.

Harvesting Ruta Baga.

MESSRS. EDITORS—I do not remember to have seen any description of the method which we have practised for the last two years, to harvest the ruta baga. It may not be new to all your readers, but if to me, it will do some good, and will pay that person for his year's subscription.

We cut the tops before pulling, with a common hoe, ground sharp; then rake them off into heaps, and pull the turnips with what is called here a dung hook, being much like a two pronged fork bent at right angles to the handle. I think we save at least half the labor of harvesting in this manner.

As we did not raise beets, or carrots, I cannot say whether the same plan would work equally with them, so far as cutting off the tops.

We lost several bushels of our roots by their being buried too deep. I am satisfied there is more danger to be apprehended from too deep than too shallow covering.

From the experience which we have had, I believe there is not sufficient attention paid to the root culture in this section of the state. It is gaining favour slowly with the farmers, and has increased within the last five years in this region nearly an hundred per cent.—The public favor is at present divided between the sugar beet, the carrot, and the ruta baga. Large crops of each kind have come under my knowledge in the last two years. On wheat farms I consider the root culture as indispensable, inasmuch as it enables the

farmer to make his straw a good substitute for hay, and thus add greatly to the productiveness of his farm.

Sincerely Yours,

J. C. PETERS.

Durien, May 16, 1840.

Improved Horses Wanted in Oneida Co.

MESSRS. EDITORS—I am a farmer residing in Oneida county, and believing that there is great need of improvement in the breed of our horses, I regret that no more has been said in our agricultural papers on the subject. It costs about as much to raise a colt that will sell for only fifty dollars, as it does to raise one worth one hundred and fifty. In the counties of Madison, Herkimer, Cayuga, and Oneida, I do not believe there is one really good stallion. And there are many wealthy farmers in these counties, who would willingly pay a handsome price for the services of a first rate horse. I cannot but think that if some person would introduce such a horse into the county of Oneida, he would be well remunerated. The kind of horse we want is one whose stock would make what are called first rate carriage horses. We do not want the unwieldy English cart horse; they are too slow and too heavy for our use. Neither do we want the breed of race horses; they may suit the sporting gentlemen of the south, but we eastern farmers want a horse that will combine the most usefulness with activity and beauty.

If you or any of your readers can inform us where such a horse can be found, within any reasonable distance of Utica, and will insert a notice thereof in your next paper, you will confer a favor on more than one
May 6, 1840. ONEIDA FARMER.

Rural Taste.

When at Newport, R. I., last summer, in passing up Prospect Hill, a walk which gives one of the thousand and one enchanting views of that "fairest Isle of the Ocean;" I noticed a beautiful cottage whose piazza in front instead of being supported in the usual way by white Grecian columns, there was used as a substitute, rough cedar posts, around one of which clambered an Ivy—around another a Woodbine—then the Azalea Japonica, Glauca, &c. &c. The rough exterior of each simple post was thus made the conductor of Nature's own architecture, which, together with the other "surroundings" of shrubbery and floral decorations, gave me a kindly feeling, mingled with respect, for the unusual good taste of the inmates or proprietor of the cottage.

On inquiry, I learned that this was the summer retreat of Finn, the celebrated comedian, who was since lost in the Lexington. 'Tis said that this man "loved nature for herself, and rural nature above all." But, like Fanny Kemble Butler, he loathed "orange peel and paint," and the other factitious things of his profession, from the very bottom of his heart.

In riding about our beautiful lake country, I am always astonished at the evidences of uncommon agricultural wealth. We have no precipitous, cold, wet mountain land, no rocks of the sandstone family, no swamps, no barren heaths, the whole substratum of our region is a continuous fertilizing fossil. Nature seems to have decided that our country should be the most salubrious and fairest portion of her great domain.

Of late it has been discovered that the deep chrysal waters of our lakes are inhabited by numerous shoals of the largest Trout. As our wood decreases, we have the bituminous coal of Western Pennsylvania, brought by rail road and water to our own door. Our main rail road and steam boats on the North River, has almost annihilated the distance between this region and our great commercial New-York. But what has man done to second nature—by improving all her

blessings—by the proper study of her simple, yet always impressive lessons in rural taste? I answer, nothing.

If I had ever seen ten modern farm houses, built in the form, or copying the simplicity of that which the proprietor might have felt to be, Shensstone or Wardsworth's *beau ideal* of a rural tenement, I would be less severe in judgment.

The village copies the city, and in like, (let me call it *distemper'd*) taste, the country copies the village. How often do we see a farm house painted white, with green blinds, standing on some bleak eminence, end to the road, high proportions, as if the proprietor expected to lay out his whole front line in village lots; not a tree of the original forest around it, or if perchance a single oak has been spared, the axe of modern vandalism, has made deep incisions into its trunk, the deadly effects of which, nothing but the superior power of its parent soil enables it to overcome. In the front windows you see perchance two or three dusty, starved house plants, tended by unskillful fingers, or languishing neglected in clay pots, as if the farmer's daughter meant only to imitate, or perhaps caricature the fashion of the village, without a single impulse of taste or enthusiasm in the matter. Not even a stunted lawn, not a bush or clambering vine, relieves the eye from the sepulchral whiteness of the house. Perhaps a cabbage garden thrust out to the road side, is the only thing that brings the imagination back from the tenements of the dead, to the edible comforts of the living. S. W.

Seneca co., May 10, 1840.

Insects (Aphis) on Fruit Trees.

MESSRS. EDITORS—Some of my fruit trees are covered with small insects resembling lice, which I am fearful will kill them. I have applied no remedy, because I know of none which I think will destroy them without injuring the trees. I therefore apply to you, and if you, or your correspondents, can give me some information about these insects, with the means of their destruction, you will oblige many readers in this county, where trees are infested with them.

Ontario co., May, 1840.

W*.*

Remarks.—The insect mentioned above is too well known to farmers and gardeners in this vicinity. The genus *Aphis* embraces many species and varieties commonly called lice, which infest trees and plants.—In the green house and nursery they are very troublesome, and many kinds of garden vegetables, as cabbages, &c., are frequently infested with them. They sometimes attack fruit trees in the orchard or garden, and greatly injure, although seldom destroy them. Various methods have been recommended for destroying these insects, but all that we have seen are either difficult of application, or but partially effectual. The following extract from the *Cultivator*, contains some information on this subject:—

"The true aphid are usually very small, their bodies of a short consistence, the eyes enure, and the abdomen furnished with two horn-like projections at its posterior extremity. Their movements in walking are slow, they cannot leap, and during a large part of their lives are without wings. They have no proper mouth, but are furnished with a sucker which they use in extracting the fluids of plants which constitutes their food. When the aphid first appears in the spring, they are usually solitary, and all females. These give birth to living young, and these, too, are females—the males not being produced until late in the season.—Unlike any other known insect, the females thus produced continue to multiply their numbers without connexion with the male—the effect of the parental impregnation extending, according to Huber and Bonnet, to no less than eight generations. The effect of this singular mode of re-production, is a multiplication of such rapidity, that Remur calculates a single mother in five generations may be the means of producing 5,904,900,000! Every farmer witnesses instances of this rapid increase. A single female fixes

herself on the leaf of a turnip, cabbage, or the tender shoot of a tree. In a few days they can be numbered by thousands, each vigorously employed in pumping out the juices of the plant, and thus injuring, if not wholly destroying it. The leaves curl and wither, and if they fix on plants intended for seed, the seeds are not perfected.

Another striking peculiarity in the aphid, is the honey like product it furnishes in such abundance; and which, during the summer months, constitutes the principal food of the ant. The two horn protuberances just mentioned, are hollow; and while they are fixed to the leaf or twig, small drops of transparent liquor exude from the opening, and if not taken off by the ant are thrown off into the air. A few years since a magnum bonum plum tree, standing in our garden, was infested with millions of aphides, the under side of the leaves being enervated with them. From this tree there fell a continued shower of these minute drops, looking, when the sun was in the proper direction, like falling mist. The current leaves, grass, &c., below, was frequented by flies and wasps, as the tree itself was by numerous ants—all partaking of this animal nectar.

The destruction of these insects is a matter of much difficulty, after they have once obtained possession of a plant. Close fumigation of sulphur, washing or sprinkling with soap suds, tobacco water, &c., may sometimes succeed; but the surest remedy is to watch their appearance, and whenever a colony appears, crush it at once, by destroying the leaf or twig. The figures we have given are those of the *Aphis rosea*, a fair representation of the species generally; green, and preying on the shoots of the rose bush, the flowering of which it damages or prevents. The figures are much magnified."

Domestic Manufactures--Protective Tariff.

To the Editors of the New Genesee Farmer:

GENTLEMEN—I owe you an apology for so long delaying to answer the circular, in which you did me the honor to ask my name to a call to a public meeting, &c.

My apology in this, as in all other business matters, is, alas! a permanent reality;—I am, unfortunately, a confirmed valetudinarian, confined by illness at, or in the immediate neighborhood of, home. As I could not attend the contemplated meeting, I thought it would be improper for me to join in the responsibility of calling it. I am, however, happy to see it most substantially called; and doubt not that this incipient step will result in the permanent establishment of a society, which will do much to promote the honor, influence, and interest, of our humble and self-degraded profession.

The respectable list of names appended to the call is a sufficient guarantee that all things will be well done; yet there is one subject which bears so prominent a place in my mind, that I must beg you will allow me to suggest the propriety of presenting it for consideration at the meeting. I allude to the importance to the interest of the agriculturist in particular,—as well as of all classes in general,—of a *sufficient and permanent protection by government of the manufacture in our own country of all fabrics for which we can furnish the raw materials.*

But how is this important object to be attained? I answer, by organization and systematic action:—by union and zealous perseverance:—by supporting agricultural papers and forming and sustaining agricultural societies throughout the whole length and breadth of the land:—by stimulating these to discuss the subject far and wide, and show its importance to every farmer in the country. Show each individual his *self-interest* in this matter;—tell him, and *prove to him*, that when we use foreign goods we have no market for the produce of our fairs, and when we use domestic goods our market is good, money is plenty, and prices are high; that this ever has and ever will be the case, as sure as effect will follow cause.

Why may not your paper and your society take the lead in diffusing information and eliciting interest and action upon this important subject? Open an exten-

sive correspondence with other periodicals, societies, and individuals;—wake up the farmers, the manufacturers, the tradesman, the every class and profession; for we are deeply interested in this matter.—Prepare then for selecting members for the next Congress with particular reference to the subject; and for memorializing the present Congress, next winter, with a zeal and numerical force that shall command respect and action.

Who can contemplate the present and increasing political power of a comparative handful of abolitionists, and doubt that the host of agriculturists in this country can, by organization, unanimity, zeal, and perseverance, carry a measure which the best interest of a vast majority, if not indeed the whole of this great nation demands?

Hoping and trusting that your contemplated society may be organized "upon the best and surest foundation" for lasting happiness and prosperity, I will close this letter,—already too long,—with the following sentiment:—

A PROTECTIVE TARIFF:—*the corner stone of agricultural prosperity, and the sheet anchor of national independence.*

CHARLES CRANE.

Centerfield, Ontario co., May 15, 1840.

From the Buffalo Commercial Advertiser.

Domestic Manufactures.

Passing by the miserable condition of the currency, our country was never so well prepared to engage extensively in all the more useful branches of substantial manufactures, as at the present time. Cotton and wool are abundant and very cheap, and such are our facilities for growing these great staples, that the price can be maintained at a very moderate range, and still afford a fair profit to these important branches of agriculture. Our western prairie farmers, whose plantations often exceed in extent many German principalities, and supply our manufactures with any desirable quantity of wool, at the lowest rates, as the carcasses of their sheep will more than pay the whole expense of their keeping, which will render the money received for their fleeces, clear profit. Provisions to feed operatives are now very abundant, and such is the impulse lately given to the great business of cultivating the earth, that the price of its products must range very low for many years to come. Those who imagine that England will need much of our bread stuffs, for the next ten years, are but little informed as to the decided improvements and increase in the agricultural operations, both in Great Britain and the Continent.

Our farmers, who control the ballot-box, must, by judicious legislation, provide a stable home market for the products of their industry. We beseech them to weigh well the fact, that there was brought into the United States and sold, no less than one hundred and fifty-seven millions' worth of foreign goods in the year 1839. And in this connection, remember that the duty on American flour in English ports, on the 15th of April, 1840, was two dollars and fifty cents per barrel. This is more than the flour is worth in the wheat growing sections of Ohio, Michigan, Indiana, and Illinois. Shall our own agricultural interest have no countervailing protection? We imported, last year, twenty-one millions of silks, *duty free*. Suppose, instead of sending abroad twenty-one millions of specie, or its equivalent, to pay for these silks, we had manufactured that amount more of goods at home, at least ten millions of provisions, in one shape and another, would have been consumed in the operation; and all the profits of the manufacturers, the producers of the raw material, mechanic labor, and the food consumed by all, would have enriched our own citizens.

Our mechanics, such as shoemakers, blacksmiths, carpenters, tailors, and the like, have a deep interest in the encouragement and protection of domestic manufactures. Indeed their interests are the same with nearly all other classes, who must depend on the productive industry of the country for their own individual prosperity. Hence, the great national importance of encouraging, by all suitable means, every man, woman, and child, to be both industrious and economical. Hence our *republican* family should not so disgrace themselves as to maddly run into debt to Europe 157 millions a year, for worthless aristocratic finery, and then have one half of the property in the Union sold under the hammer to foot the bill. All sensible men should insist on an effectual protective

tariff, that shall cut off this disastrous extravagance. If the rich will have one hundred millions worth of silks, wines, and the like, from abroad, let them pay into the national treasury at least forty millions, which can be well expended as a common school fund, as has been done with the surplus belonging to the State of New-York. This will be a tax upon luxury for the benefit of education, general science, and intelligence.

From the New-England Farmer.

First Manufacture of Beet Sugar in New England.

The subjoined communication has been some time held in reserve; under the expectation that we should have been sooner prepared to make a full report on the subject of Beet sugar. As that is now necessarily postponed, we give it as an interesting account and memento of the first attempt made, in New England, to manufacture Beet Sugar. The sugar produced was much of it of a very good quality. We know the communication will be received with pleasure. We have at this moment no time for farther remark.

May 20, 1840.

H. C.

REV. HENRY COLMAN—Sir—In compliance with your request, I hand you herewith a description of the process pursued by Mr. George A. Perkins and myself, in manufacturing the beet root sugar, of which I gave you a specimen in the autumn.

The beets raised by me the last season, are the variety known as the White Silesian, yielding a light cream colored pulp, and recommended, both by Achard and Dombasle, as the best and most productive.

The first process to which we subjected our beets was cleaning. This we effected by scraping with knives, which is, however, a long and tedious operation, and we are inclined to give the preference to washing in wooden cylinders, which would be a great saving of labor, where a sufficient supply of water could be obtained.

The machine used for rasping the beets, was the common grater cider mill, upon which we have made a slight improvement, by inserting several rows of teeth upon the face of the cylinder, by means of which we obtain the pulp in a finer state; and with an iron screw press, which we substitute for the lever we at first used, have extracted 55 per cent. of juice, instead of 35, which was our first maximum. Above the cylinder of the rasp is fixed a deep wooden hopper, of sufficient size to admit the largest beet, each one of which is held and pressed on by hand separately. The rasp is turned also by hand, the labor of which is rendered comparatively light, by affixing the handle to the centre of a large wheel, four feet in diameter, over which runs a band drawn tightly into a drum or pulley upon the axis of the rasping cylinder. The pulp falls into a box beneath, whence it is taken by shovels and turned into the bags, which are made of strong Russia duck. Those which we use are 18 inches long and 12 inches wide, containing about 10 pounds of pulp, and when taken from the presses are not more than half an inch in thickness. The manner of folding them, by turning down the two upper corners and lapping over the whole, is similar to that practised in expressing oil. In our experiments we generally press five bags (say 50 lbs. of pulp) at a time, the bags being separated from each other by boards, instead of hurdles. From 4 bushels of beets we obtain about 10 gallons of juice, which has ordinarily yielded us 5 lbs. of sugar.

Having poured the juice into the boiler, a common brass kettle, containing 15 gallons, set in brick work over a furnace, we immediately kindle the fire, and the juice being heated to 180° of Fahrenheit, pour into it a cream of lime, formed by dissolving two ounces of lime into a small portion of warm water, and stir it constantly for the space of fifteen minutes. Then increase the fire until the juice reaches the point of ebullition, when we pour from a pitcher a portion of the juice, reserved for the purpose, upon any bubbles which may show themselves, for the space of thirty minutes. The entire surface of the boiler being now covered with foam, extinguish the fire by throwing into the furnace a pitcher or two of water, permitting the juice to remain undisturbed, until it deposits a sediment and becomes clear, which it will generally do in the space of two or three hours. This process is called defecation of the juice.

The next step is to concentrate it. When the juice has become perfectly clear and limpid, but not before, we draw it off by means of a siphon, leaving in the bottom of a boiler a black arolic matter, which was precipitated with the molate of lime. Should the juice have undergone any alteration by an excess of the use of lime, it will be necessary to neutralize it by

pouring in a small quantity of sulphuric acid, diluted with water. We determine the point of saturation by using Tumeric paper, which, if there is an excess of lime, is colored of a reddish brown. A little practice will soon make one familiar with this part of the process. Having neutralized the excess of the lime, leaving the juice slightly alkaline, and the kettle having been thoroughly cleansed, we return it again to the boiler, and find that it is reduced to about seven gallons, in consequence of concentration and the loss of the black sediment.

Rekindle the fire, and the juice being at 100° of Fahrenheit, commence adding slowly 2 lbs. of animal charcoal, stirring it briskly the while. The syrup having been kept in a state of ebullition some minutes, a thick white scum of a waxy nature appears, which having been skimmed off, we throw into the kettle a pint of cold water to abate the ebullition, and immediately add the whites of 3 eggs, beaten in water. Increase the fire, stir briskly, and skim for half an hour, or as long as the scum continues to rise; at the expiration of which time, extinguish the fire, and draw off the syrup into the filters, to remain during the night. In the commencement of our experiment we used conical flannel filters, for which we have now substituted two and even three thicknesses of woolen blankets, secured upon a wooden frame or stand, which we find answer a better purpose.

If the operations of the first day have been successfully performed, the liquor in the morning will be found clear and transparent, marking 20° on the hydrometer, at which point we commence the clarifying process. The syrup is now reduced to 2½ or three gallons, and returning it again to the boiler, having first greased the sides thereof with a morsel of butter, to prevent its burning; rekindle the fire, and should there appear any impurities, we add, before heating, the white of an egg, well beaten, removing them carefully with the skimmer. The fire requires to be watched very closely, as there is at this stage, great danger of burning the syrup, which should be kept moderately boiling, until it marks 45° on the hydrometer, when the proof by the thread should be taken, by cooling a portion of the syrup between the thumb and fore finger: separate them suddenly, and if the filament breaks that, curling itself into a horn or spiral, the process is completed. The fire is immediately extinguished, and the syrup conveyed to a tub or cooler, in which crystallization commences, when it must be thoroughly stirred, and thence turned gradually into the moulds, the points or cones of which have been previously stopped with a peg, and the moulds themselves saturated with water, in order that they may not imbibe any portion of the syrup. In the course of an hour or two, a crystallized crust forms itself upon the top of the moulds, which must be carefully stirred and broken, in order to collect the crystals into the centre. At the end of three days remove the plugs from the points of the cones, set them over the pots to drain, where they are to remain ten days or a fortnight, by which time the sugar will be found to be dry and perfectly crystallized.

I have thus detailed to you, I trust with not too much minuteness, the method pursued by us in several experiments of manufacturing sugar from beets, in which we have been principally guided by the directions of Chaptal and Fontenelle. When one has become acquainted with the process, I am convinced there is nothing connected with it, which an intelligent farmer cannot comprehend and practice; and I see no reason why every man who cultivates fifty acres of land, should not have his acre or half an acre of beets, and manufacture not only sugar enough for his family, but a few hundred pounds besides, which he might exchange to advantage with his grocer for many of the comforts, or it may be, luxuries of life.

I remain respectfully,

Your friend and servant,

PICKERING DODGE.

Salem, Jan. 30, 1838.

To prevent Hens from Scratching.—The Philadelphia Ledger says that a yankee has invented a method of keeping hens from scratching in gardens. The plan is to tie two of the toes of one foot. The hen cannot scratch with the tied foot, and she cannot stand on that foot alone to scratch with the other.—This is the age of invention.

THE FLY.—The Easton (Md.) Gazette says that the Hessian fly is doing dangerous injury to the wheat in that and the adjacent counties.

The Worcester (Pa.) Star states that the Hessian fly is ravaging the wheat fields of that neighborhood, to a considerable extent.

Hay and Hay Making.

First, as to the time of cutting the crop. In Massachusetts, Herds Grass or Timothy is the principal grass grown. What now is the best time for mowing this grass? The general answer given by the farmers is to cut this grass when it is in the flower; or when the blossom begins to fall. By some it is maintained, and this too upon high authority, that Herds Grass is most nutritious, when it has become completely ripe; and the seed is in that state that it would vegetate perfectly if planted. We deem it a matter of considerable importance to determine this point. We do not expect from our farmers a critical exactness; but we have no doubt that many of our experienced and intelligent farmers have made very careful observations of this matter, and their opinions are what we want. Let the farmers, if they can, say then what trials they have made, or what they have observed in this matter. Some persons insist that the appetite of the cattle is the best criterion; and that what they like best must be best for them. We have not the same confidence in the wisdom of this bench of judges, though so much given to reflection in their ruminating hours.—It is certain that if left to them they would much prefer to eat Indian corn for example, in a green and half formed state; but will any farmer say that corn in this condition would yield as much nutriment as when perfectly ripe? We have great respect for animal instinct; but we have much more respect for the reason and experience, and sound judgment, based upon careful observations, of intelligent men.

A second matter of important inquiry respects the curing of clover hay. Some years since an experiment was made by the Rev. Mr. Packard, of Marlboro'—and another by Samuel W. Pomeroy, then of Brighton, a gentleman possessing one of the most observing and acute minds that are to be met with, of curing clover hay by salting it, the details of which experiments were given in the Massachusetts Agricultural Repository. In these cases the clover was cut in the morning and carried in the afternoon, and when packed away, abundantly salted. It is said that this hay came out green, fair, and in fine condition. But there is a prejudice against this mode from a notion, perhaps not without foundation, that the quantity of salt necessary to be employed in such cases destroys in some measure the nutritive properties of the hay.

Be this, however, as it may, another mode has been adopted to some extent in this and neighboring states; that of cutting the clover while dry or free from wetness, and after a few hours sun upon it without shaking it abroad much, putting it in a cock; allowing it to remain until it becomes well made in the cock, and merely turning it over the day of its being carried in, that the bottom of the cock may become dry; then taking it into the barn. We are not certain that we have described this method intelligibly and properly; but we hope that some of the farmers who have cured their clover hay in this mode, will set us right both as to the mode and the results.

There are other points in regard to hay which we wish could be determined. For example, is hay injured by sweating in the mow or not? Many of the farmers on the Connecticut river, who were in the habit of "making their hay a great deal," have altered their course, and now get it in in a much shorter time, and in a comparatively green condition. They say much labor is saved, and the hay spends better for their cattle. It does not come out so bright; the top of the mow will appear even discolored and injured; and it would scarcely pass for merchantable hay in Boston, but the stall-fed cattle eat it better and thrive as well upon it; and therefore they consider it more succulent and nutritious, than if it was as thoroughly sun dried as possible. An experienced English farmer, upon whose authority we place some reliance, was accustomed to say that hay was always better, to use his own expression, for "sweating well in the mow." It will certainly not do to get hay into the barn with any wetness upon it from the dew or rain; but with how much of the natural moisture or sap remaining in it, it may be safe to put away, is the point on which we solicit information.

Another point of importance respects the spreading of hay. Should it be given in a long state, or should it be cut; and if cut should it be cut finely or closely? We have many facts on the matter of cutting all feed for stock; but we want more facts from the careful and observing. One of the agents of the Eastern Stage Company, who had under his charge a large number of horses, said that he preferred to give them hay cut about four inches long rather than shorter. It compelled the horses, he said, to chew their feed, whereas, when cut short, an inch or three-quarters of an inch in length, mastication was imperfectly performed.

Men in all such cases are seldom without a reason; but perhaps the true reason was that his machine was not adapted to cut his feed shorter than four inches in length.

Another matter which we wish could be ascertained relates to the shrinkage of hay. How much will a quantity of hay weighing one ton when put into the barn at haymaking, weigh in the month of March ensuing; or how soon does it arrive at a condition where it may be expected to hold its own? We have generally heard it estimated at one-fifth loss in that time. We have no facts in the case; but it is obviously a point of much importance in determining the farmers, who sell hay, and the persons who buy hay, how the price should be made up; and at what rate they can afford to sell hay from the field, compared with what they expect to obtain for it in the spring.—*New England Farmer.*

Plugging Fruit Trees.

Messrs. Editors.—Some seven or eight years ago, you doubtless recollect there was considerable said about plugging fruit trees with sulphur and other substances, to protect them from disease and insects. I had thought however that this was all a humbug which had lived its day and received its doom; till a few days since a respectable looking man told me he had practiced a similar method with the most perfect success, on many trees in Livingston Co., for several years past; and that he had discovered a compound which on being inserted into the body of the tree, would in a few hours expel all borers, caterpillars, curculios slugs &c. &c., and would effectually prevent all injury to the tree or fruit from these depredators for many months after the application. I asked him if so powerful an agent would not injure the tree or render the fruit unwholesome. He replied it would not, as the ingredients were all used by men as medicine, and the quantity absorbed by the fruit was so very small that nothing but an insect could possibly discover it. He evidently did not belong to the Thomsonian school of medicine however, for he informed me that Calomel and raw quicksilver were among the substances employed. How they were to be dissolved and made to circulate in the sap of the tree, is a mystery which he did not explain to me.

If there is any truth in his statements, some of your readers in Livingston Co. must possess information on the subject; and if so, I should be glad if they would give some testimony concerning it, through the *New Genesee Farmer*.

MONROE.

May 27th 1840.

Horn Disease in Cattle.

Messrs. Editors.—I saw a statement in your last number, of an ox that was taken sick and died, supposed from the horn disease. Now, I am not a farrier nor a farrier's son, but I learned forty years since how to cure the horn distemper, and can do it without risk or failure if applied to in season. I have cured them when fat, and past standing, and in winter when they were poor. You will easily discover when it is the horn ail, by their dull and sunken eyes, dry nose, cold horns, and refusing to eat.

The following is my remedy:—Take half a table-spoonful each of spirits of turpentine, camphor, fine salt and black-pepper made fine, and one gill of sharp vinegar. Mix them together, warm them to a blood heat, turn the animal's head so that the ear will be uppermost—take hold of the ear and put into it as much as you can, hold it tight, and pull it up several times; then serve the other the same—do it once a day for three or four days—split the tail if necessary—and the cure will be effected. There is no mistake about it.

A. DIBBLE.

Byron, Genesee co., N. Y.

Life is a flower garden, in which new blossoms are ever opening as fast as others fade. Nature is the mirror of the Invisible One.

The A, B, C, of Silk-Culture.

There will be hundreds of individuals in Virginia, who will feed silk-worms during the next season, either on a large or small scale: still, there will be a far greater number to whom it would be fully as convenient, but who will be deterred by different considerations from attempting the experiment. As we feel assured that every one who will make a fair trial will be pleased with the result, and that each small trial will induce more extended operations, we are anxious to persuade as many as possible to make experiments, no matter on how limited a scale of operations. With this view, we will offer a few suggestions, or smaller matters of advice to beginners, which may possibly help to smooth away some supposed difficulties.—There are no important difficulties if proper care be given.

For a small beginning, and for success, it is not necessary to have the *morus multicaulis*, nor even the white mulberry, if the experimenter has (and who in the country has not!) enough leaves of the native mulberry tree. It is true that this is inferior as food to the white mulberry, and that again as much inferior to the *multicaulis*. But the worst of the three will serve well enough to make a successful rearing. Therefore, the want of the best, and by far the most proper and economical kind of food for large operations, need not prevent a beginning, and doing well, on even the worst kind.

For such small operations, it is not necessary to have any shelves, hurdles, stoves, or other of the arrangements suitable and requisite for a regular business. A common dining table will afford enough surface to feed one thousand worms to their full growth; and a table may be easily and effectually secured from the invasion of rats and mice, and ants and other insects, which very often destroy the worms and the hopes of the experimenter. The table is so secured, by being placed a foot or two from any wall, and far enough from any approach, whence rats can leap down upon it, and the legs of the table being set in tin-pans of water. Two such tables, connected by rough planks, laid from one to the other, would afford a surface sufficient for 5000 worms, which would be enough for a first trial. Thus the second, and what is deemed a great difficulty, may be removed.

But supposing that these and all previous obstacles have been obviated by such or better means, and the worms hatched for a rearing, there still remains another difficulty which almost every young culturist brings upon himself, and which causes so much unnecessary trouble and loss of worms, as to weary and disgust many a beginner, before the commencement of the time when much care or labor is really wanting. The young worms are fed so lavishly, that nineteen-twentieths of the food, (if not much more,) remains unconsumed, and forms a great accumulation of litter, which soon needs removal. Again, to save trouble, (as it is thought,) the leaves are usually given whole. If the leaves are very young and tender, (as they ought to be for very young worms,) they speedily contract in drying, and each, as it curls up, encloses the worms which may be feeding on it. The worms being so superabundantly fed, have no inducement to move, until after being thus imprisoned, and the leaf has become too dry to be longer fed on. To make this result the more sure, the young worms eat only the tender, green part of the leaf, leaving the numerous and closely crossing fibres like fine net-work. By the time that the leaf is dry and unfit for food, it thus forms a net, or snail, from which the worm cannot always escape, when impelled by its renewed appetite. Thus many worms are concealed or damaged, and will suffer, and many will even die in their confinement, unless searched for and relieved; and that operation, with the cleaning away the great quantity of litter in and among which they are enveloped, will, in the first two ages, give more trouble, and cause more loss, than ought to be met with during the whole rearing.

Now all this trouble to the feeder, and injury to and loss of worms, may be avoided by simply cutting the leaves into fine shreds, and sprinkling them on thinly. Then, even, if greatly excessive feeding be not avoided, it will do no harm. The worms are not restrained by the breadth or weight of the leaf, and they can easily climb to the upper surface, as is always their disposition. The unconsumed shreds soon dry, which is a great advantage for all which must remain in waste. The dried litter is loose and open as any bed can be, and when quite dry and sweet, (as it will be usually,) need not be removed until after the end of the second age, at about ten or twelve days after the hatching. But it is very easy to remove this litter.—By feeding the worms at first in narrow strips, or in small squares or circles, and sprinkling the fresh food at

the outer edges of the space, the worms will crowd to the fresh food, and soon leave naked the greater part of the old litter, which may be taken up in masses and separated from time to time, and thrown away, without picking off or disturbing a single worm. Such will be the course of things even with the most wasteful feeding, (and it is always given wastefully to young worms;) but if the excess of food be less, even this small amount of trouble will be still more reduced.

It is not designed that these suggestions should serve as full directions for feeding, even through the two first ages; nor by any means to substitute the full directions to be found in most treatises on silk-culture. The young culturist ought, of course, to read and consider these, though it will not be necessary to follow each rule. The object aimed at here, is merely to remove early and unnecessary obstacles, which serve either to deter from beginning, or to discourage after beginning, nearly all who are inclined to make a trial. These remarks apply to no more than the two first ages. The feeding through the third, fourth, and fifth ages, requires much more care, labor, and cost; but still will not be difficult to those who have gone properly through the earlier feeding. Every treatise (of which several are in previous volumes of this work,) will furnish rules of conduct, which, if modified and corrected by the feeder's judgment, according to existing circumstances, will serve to conduct him to a successful result.

But by success it is not meant that the experimenter who feeds 1000, or even 10,000 worms, will make a net profit from his expenditure, and his care and trouble for the time. Such an expectation would be most unreasonable, from any business so small, and yet requiring such frequent and careful attention. Perhaps 50,000 worms, with proper facilities and method, would not require more than twice as much labor or time or attendance, as 5000 only; and the mere waste of the food of 1000, as usually bestowed, might feed 5000, and yet save labor (in clearing away the litter,) instead of causing more therein. If the young feeder loses very few of his worms by accidents or disease, and generally obtains very good cocoons from all others, and finds no great or insuperable difficulty in any part of the operations, then it may be deemed a successful issue, and indicating, with sufficient assurance, a net profit upon his next and sufficiently large operations.

There is one caution necessary to be added. It is all-important to have eggs from a healthy stock of worms, and that have been well kept during winter. Whoever has to purchase eggs, incurs great risk of loss on this score. Eggs from a sickly stock will be sure to produce a sickly and worthless progeny; and even if from healthy stock, still improper management in keeping, and especially exposure to too great and too frequent alternations of cold and heat, will cause the worms of eggs so treated to be unhealthy. From such causes, induced either by ignorance or by fraud of the salesman, nearly all the eggs in this market last year were worse than worthless. Though the danger will be less this year, still there is enough ground for fear to make every buyer very cautious. Many beginners at rearing silk-worms, have been discouraged by their mishaps proceeding solely from this cause; and all would, and very reasonably, have been thus discouraged, and made to consider the business hopeless, if other experiments had not been made with good eggs, which served to show the cause of difference.—If disease from hereditary taint, or because of diseased eggs, begins to show among silk-worms, it is best at once to throw away the whole; for they will seldom be worth saving. But in this excellent climate, and with proper care in feeding and cleaning, there is little danger of disease from any other source than hereditary taint, or bad keeping of eggs.

Breaking a Colt by Kindness.

Some good people who raise colts are not aware that they are thinking animals, and have feelings, passions, and affections very much like human beings.—They cannot talk—that's all. People who do not appreciate the character of horses, are apt to treat them like brutes, without love or mercy, and without any appeal to their glorious intelligence. "The horse knoweth his owner;"—and he knows much more,—he knows when he is treated as a Christian's horse should be—and in respect of treatment the Turk and Arab have much the advantage of us in civilization.—Those pagans make friends of their horses—they love each other, and in the sandy desert or the wide plain, they lie down side by side, and each is equally ready to resist the approach of an enemy.

It is not often so with us. The Colt is left to grow up to manhood wild in the pasture, with very little ac-

quaintance or sociability with his master. As soon as he is thought strong enough to work, he has a saddle or harness slapped upon him, so hard as to make him tingle again. He is put into some strong cart or wagon without understanding what is wanted, and being bewildered in his ignorance, and exasperated at such rough handling, it is generally the case that he exerts his strength to get out of the scrape and avoid his enemies, by plunging, kicking, throwing himself down, and sundry other such *cilic tricks*, (as they are called,) as would naturally occur to a poor beast who thought himself villainously abused. While this is the operation in the mind of the unsophisticated colt, the *horse-breaker* is swearing at his vicious obstinacy, laying on the licks with the string or the butt of the whip handle, and doing his best to draw blood at every stroke. His intention is to subdue the beast to obedience. He may succeed, but it will only be by destroying his noble spirit, and rendering him a tame, passive beast of burthen, working only as he is forced, but without ambition or good will. The man is the most ignorant brute of the two. He is destitute of all proper knowledge of the animal "who knoweth his owner," and should be beaten with many stripes himself.

The fact is, the colt should be treated with unvarying kindness, except when he is manifestly vicious, contrary to his own knowledge, after having been fairly taught. When he is taken up for breaking, he should be kept hungry, and be led from the hand of his master; while all the little tokens of praise, fondness and approbation, which are as gratifying to a horse as to a woman, should be liberally bestowed upon him. No act of rudeness or unkindness should inspire him with fear;—and in a short time he will come to his master as to his best friend. Let him feel that he is safe in the hands and care of man, and he will place confidence in that attention which is bestowed, and with a light heart will exert himself to please his rider. Bestow upon him the whip, and jerk him about with the halter and bridle, and his temper will rouse to resistance, or sink to stupidity.

A horse may be taught, like a child, by those who have won his affections; but the method of teaching is by showing distinctly what you want him to do, not by beating him because he does not understand and perform at the outset. Judicious arrangement is required in the course of instruction, for these creatures, like men, have very different intellectual capacities and tempers; but all may be mastered by kindness, while the best, the most high spirited, the most generous, will be ruined by beating.

To illustrate this, which we mean to enlarge upon hereafter, we will relate a little circumstance that occurred during a tour to the White Hills. Having a horse—a fine light grey saddle pony, we undertook, with a friend, to ride to the summit of one of the mountains. Federal—that was his name—and he belonged to Niles—would have done any thing for me, and he and I had become well acquainted, and he was a most noble hearted fellow. Federal clambered up according to my directions. I thought I could see the best way, and guided him accordingly. We got at last upon the peak, where was a level of some yards square, and Federal, who had never been up so high in the world before, as we slackened the rein, turned three times round to look at the prospect, and then set up a scream of delight. It was not a neigh nor a whinny, nor any common mode of talking for a horse, but it was a regular hurrah, as much as to say "O! thunder and lightning! Aint this glorious?"

After a while we turned to descend, and I gave Federal his own way. It seemed at times rather a ticklish job; but he managed it well. The little rascal stopped now and then and made a survey as carefully as could be done by a civil engineer. He turned and tacked, and worked ship, like an old sailor among the breakers; and being careful and surefooted, he came down safe as a tortoise. But we brought up at last against a fence—having taken a different direction from that by which we ascended. We rode at the fence fairly, but Federal stopped short. "You fool," said I, "can't you jump?" Tried it again—no go. I stopped a moment, and think I to myself this horse has never leaped a fence in his life. I felt sure he would have tried his best for me at any time, and would have broken his neck sooner than have refused—if he had known exactly what to do. I talked kindly to him—coaxed him—patted his neck—and as soon as I saw his head raised about two or three inches, and his ears pricked up brightly, and felt the muscles of his side swell under the saddle, I knew he had caught the idea—that was all he wanted—I gave him the hint to try it, and over he went, like a swallow, at least two feet higher than was necessary. The little scamp meant to make a sure job of it. He was no sooner

down, than he wheeled about, looked at the fence and snorted, as much as to say, "what do you think of that?" and trotted off. Ever afterwards, during our journey, Federal was on the look out for some excuse for leaping. A log, a run of water across the road, even a stone bridge, he uniformly pricked up his ears at and leaped across—giving a snort each time to announce his joy at having performed a new feat.

The moral of the matter has been stated at the outset. Federal only needed to understand what we wanted, to do all in his power for its accomplishment. He was *only a hired horse*, but we understood and loved each other. He was little, but high-spirited, noble, generous—no whipping on earth could have managed that horse so readily as kindness and encouragement. Pulling, jerking, whipping, spurring, might have been tried in vain to make him leap the fence—with a moment to think about it, and a nice dose of flattering applause, he flew over like an experienced hunter. More about this hereafter.—*Boston Times*.

Poultry.

DEAR SIR—At your request I furnish for your paper a few remarks on the subject of chickens.

1. Never allow more than twelve hens to one rooster, a smaller number, say eight, would perhaps be better.

2. Never allow the roosters to go together; they are very jealous, and always pugnaciously interfering with each other's rights. The strongest lend away the hens; the consequence is, the eggs are fewer and do not hatch so well. Hence the universal complaint that a large number of hens are not as profitable, in proportion, as a smaller number.

3. Chickens require a good deal of water to soften their food, and gravel to grind it. They also require animal food. In winter they often cannot get water nor gravel, nor insects or worms. They are all fed, it may be, with grain, yet do not lay. Supply their natural wants. Give them water, gravel, and animal food, such as fat meat, liver, or indeed any kind of fresh meat. Keep them warm, not permitting them to become chilled, and they will lay as well during the winter as in any season.

Do not permit your hens to set at different times, or rather only a few at a time. This causes broods of different ages, and the younger are usually injured or deprived of a fair quota of food by the elder. When your hens manifest a disposition to set, let them remain on chalk eggs until as many as you intend to set are ready. Then place fifteen eggs under each hen. Select your eggs by holding them up to the light.—Those which have bluish, watery specks in them had best be rejected. They do not hatch as well, nor are their chickens as healthy as the eggs that have no blemish.

5. When the young are hatching do not interrupt the hen. When hatched, feed them with Indian meal, with a large portion of pounded egg shells.—Hens that set "out," as it is called, generally have healthy chickens. I often have examined their nests, and seldom found any remains of the shell in them.—The little ones eat them up. I have found that egg shells greatly advance their growth and health.

6. If all the little chickens could be taken from the hen and kept in a room warmed by a stove, I am satisfied from experiments, that they would do much better than to be with the hen.

7. Never allow the young chickens to get wet, nor to become cold. See that they are supplied with ground worms (fishing worms.) They will repay you for this trouble.

8. Three times a year, at least, grease the head, throat, and under the wing of your chickens. A very small proportion of precipitate added to the lard is of service. You will never have your hens troubled with lice if you follow this rule and keep your hen house clean.

9. Never allow your chickens to be without food.—I have often been asked what is the best food to make hens lay? I have made several and repeated experiments to decide this question. The result is, give your hens and rooster, (who, by the way, requires as much, nay more attention than the hens,) water, gravel, and animal food, and they will lay as well on one kind of food as on another. Potatoes, corn, wheat, rye, oats, buckwheat, barley, and any thing that they will eat, will do. Boiled food is cheapest and best for hens, especially if kept up all the year, as they should be. I have followed the above rules ever since I owned chickens. We have always had fine eggs than was required for use; and our chickens have never had any epidemic among them. With the exception of moulting season, that is when they shed their fea-

thers, with judicious management, hens will lay for 260 days in the year.

10. Hens lay well and do well for four years. How much longer they would continue fruitful, I know not.

11. There is a great difference in hens. Some lay every day until they empty the ovary. Others twice in three days. Others only every other day.—The creole breed are the best layers I have seen, except a breed of Judge Burr's, in New Jersey, called Booby chickens. They lay every day. Eggs large; chickens strong, large, and of quick growth. Hens set well.

12. Never frighten nor chase your chickens, unless they get into your garden. In that case I have found the crack of a whip more effectually deterred them than any thing else, from venturing into forbidden ground. I do not know why it is, but they seem more afraid of the smack of the whip than any one would suppose who never tried it.

If these remarks are not deemed sufficient, any other addition will be cheerfully made when required, by

THOMAS P. HUNT.

Wyoming, Penn.

The Birds of America.

From Drawings made in the United States. By J. J. AUDUBON, F. R. S. J. P. BELLE, Agent.

It is now admitted in Europe, that the Birds of America are better figured and described than those of any other portion of the world. The labors of Wilson and Bonaparte were succeeded by those of Audubon, whose inimitable drawings and accurate descriptions have brought this branch of science to a high state of perfection. He has now commenced publishing his great work on American Ornithology, in a reduced size, and according to a scientific arrangement, giving good figures on stone, and all the information contained in the larger work. With this book in his hands the school boy may become an ornithologist.

The drawings, coloring, and printing are all executed in America: the former reduced by Audubon from his large plates; the figures, although in miniature, are the same. It is published semi-monthly, at one dollar per number, and is decidedly the cheapest work on natural history ever published in any country.

The advantages possessed by this work over all others of the kind are the following:—It contains nearly double the number of species than are found in Wilson and Bonaparte. These naturalists omitted many species which have since been discovered by the industry and discrimination of Audubon. Whether these species existed at the time their works were published, or have since taken up their residence in our country, cannot, with certainty, be decided; but it is a notorious fact, that species which were never given till Audubon's work appeared, are found in the vicinity of Charleston. That this work may be relied on as authentic, the following facts will shew:—The specimens were carried to Europe and submitted to various societies and learned naturalists, and all the species were admitted to be genuine. Waterston, a violent opponent, who has no knowledge of natural history, was proved to be in error, and his subsequent papers refused admittance into the Zoological Journal. In a recent catalogue of the birds of Europe and America, published in London, by Bonaparte, all the species of Audubon are admitted, and he refers to that work as the only standard. The specimens are found in the British museum, and those of Paris and Lyden are labelled with the names given by Audubon.

Some additions will probably be made to our number of species of birds, and these may from time to time be added in future additions, but the work cannot be superseded by any other, and it will remain a standard work for ages to come.—*Southern Cabinet*.

Salting Butter.

On some occasions, a part or a whole of the butter may, perhaps, be disposed of fresh; but in general it must be salted before it can be carried to market; and as this part of the process requires as great nicety as any other, a few remarks on the subject shall be added.

Wooden vessels are upon the whole, most proper to be employed for containing salted butter. These should be made of cooper work, very firm and tightly joined with wooden hoops. It will be advisable to make them very strong where circumstances permit them to be returned to the dairy; for as it is a matter of considerable difficulty to season new vessels so well that they shall not affect the taste of the butter, it is always advisable to employ old vessels rather than make new ones, as long as they continue firm and sound. Oak is the best wood for the bottom, and staves and broad Dutch split hoops are to be preferred to all others when they can be had. Iron hoops should

be rejected, as the rust from them will in time sink through the wood, though it be very thick, and injure the color of the butter; one iron hoop, however, should be put at the top, and another below beyond the bottom, the protection below the bottom being made deep for this purpose. No form is more convenient than that of a barrel, unless, perhaps it be that of a truncated cone, with the apex uppermost; as in this case the butter can never rise from the bottom and float upon the brine, which it will sometimes do in the under part of a barrel when brine is necessary. But this inconvenience may be easily obviated, by driving a wooden peg with any kind of a head, into the bottom, before it be filled with the butter, closely embracing the butter all round, will be kept perfectly firm in its place. An old vessel may be prepared for again receiving butter, by the ordinary process of scalding, rinsing, and drying; but to season a new vessel requires greater care. This is to be done by filling it frequently with scalding water, and allowing it to remain till it slowly cools. If hay or other sweet vegetables are put into it along with the water, it is thought to facilitate the process. But in all cases frequent effusions of hot water are very necessary, and a considerable time is required, before they can be rendered fit for use. The careful dairyman ought to be particular or he will soon lose his character in market.

After the butter has been beaten up and cleared from the milk, as before directed, it is ready for being salted. Common salt is almost the only substance that has hitherto been employed for the purpose of preserving butter; but I have found by experience, that the following composition is, in many respects preferable to it, as it not only preserves the butter more effectually from any taint or rancidity, but also makes it look better and taste sweeter, richer, and more marrowy, than if the same butter had been cured with common salt alone. I have frequently made comparative trials with the same butter, and always found the difference much greater than could be well conceived. The composition is as follows:—Take of sugar one part, of nitre one part, and of the best Spanish great salt, or best rock salt, two parts: beat the whole into a fine powder, mix them well together, and put them by for use. Of this composition, one ounce should be put to every sixteen ounces of butter.—*Anderson's Essays*.

Machine for Husking, or Shucking, and Shelling Corn.

It is stated in the Maryland papers that a machine has been introduced for husking, or (as we Tuckahoes say) *shucking* corn. A correspondent of the American Farmer says that this machine "which has excited much admiration on the Eastern shore of Maryland for two years past, was invented and put in use by Mr. Hussey, the inventor of the reaping machine," of which statements have been given in the Farmers' Register. The same writer says that many farmers there, with the former machine, have shucked and shelled their corn, "at the rate of 40 bushels of shelled corn per hour; and of 100 bushels per hour of corn previously husked." This, if correctly described, must be a very curious as well as valuable machine; and we are surprised that so little progress has yet been made in extending information concerning, as well as the use of, both those machines of Mr. Hussey's. If he will bring them and exhibit them in operation in lower Virginia, and they prove deserving of their recommendations, he will find many purchasers.—*Farmers' Register*.

Labor-saving Soap.

The following is a recipe for making the labor-saving soap, (so called,) which is an excellent article for washing, and a saving of labor. The recipes for making have been sold at from \$5 to \$10, and the soap seven cents per pound; but can be manufactured for about two cents. Take two pounds of sal soda, two pounds of yellow bar soap, and ten quarts of water; cut the soap in thin slices, and boil all together two hours, then strain it through a cloth; let it cool, and it is fit for use. Directions for using the soap:—Put the clothes in soak the night before you wash, and to every pail of water in which you boil them, add one pound of soap. They will need no rubbing; merely rinse them out, and they will be perfectly clean and white.

It is estimated that 100,000,000 pounds of Beet Root Sugar has been manufactured in France the last year, and in Prussia and Germany 30,000,000 pounds. The Troy Whig states that in the Western part of Michigan, 240,000 pounds were manufactured the past season.

Agricultural Convention at Rochester.

We give below the record of the proceedings of the Convention, held in this city in pursuance of the call published in our last number. The meeting was well attended, and much spirit and energy evinced during its transactions; and we doubt not, through the exertions of the Executive Committee of the newly formed society, with the assistance of the friends of the cause, an exhibition and fair will take place in the autumn, such as our citizens have never before witnessed; and we would respectfully and most urgently request all to lend their exertions in support of the Executive Committee, that the new society and its fairs may be well worthy of the character and reputation of the farmers of Western New-York—the original "Genesee Country."

To prevent any misunderstanding, we would briefly state, that the territory intended to be embraced by the Society, must be in some degree defined by circumstances. It is intended to exclude no one who may wish to join; at the same time the society distinctly disclaims any intention of interfering in the least degree with county societies already formed, or which may be organized hereafter. While such a vast and abundant field of labor lies before us, we hail with pleasure any accession to the numbers of those whose efforts are directed, in whatever channel, to the best means of ensuring the agricultural prosperity of our country.

GENESEE AGRICULTURAL SOCIETY.

In accordance with a call published in the New Genesee Farmer, and various other papers in the Genesee country for several weeks past, a convention of Farmers and friends of Agriculture, assembled at the Court House in the city of Rochester, May 23th 1840.

On motion of Gen. Harmon, of Wheatland, GEN. MICAH BROOKS, of Mount Morris, was chosen Chairman, and ELIHU F. MARSHALL, of Rochester, Secretary.

The Chairman made some very pertinent remarks explanatory of the Convention.

After some interesting discussion and remarks from Gen. Harmon, Wm. Garbutt, Hon. Enoch Strong, Isaac W. Smith, and others,—

On motion of John J. Thomas, of Macedon, a committee of seven was appointed to present for the consideration of the meeting, a Constitution for an Agricultural Society. Wm. Garbutt, Amos R. Cole, Rawson Harmon, Jr., John J. Thomas, Isaac W. Smith, Henry E. Rochester, and M. B. Batcham were the committee.

On motion of Lorenzo Hathaway, of Perinton, a committee of seven was appointed to report resolutions for the consideration of the convention, composed of Enoch Strong, John Ayrault, Lorenzo Hathaway, Matthias Garret, John B. Smith, Elihu F. Marshall, Oliver Culver, Henry M. Ward, and Tho's Weddle.

The committee, after a temporary absence, reported the following, which, on being commented on, were unanimously adopted, viz:—

1. *Resolved*, That agriculture stands first in the scale of human pursuits;—that the products of agriculture constitute the basis of all individual and national wealth; and as the prosperity and consequent happiness of a people depend greatly on their skill in husbandry, we would unite in every effort to promote the farming interests of the country.

2. *Resolved*, That our common country is emphatically an agricultural country—that as we possess within the limits of these United States the soil and climate adapted to the production of all the necessaries, and most of the luxuries, of life, our independence and ultimate destination among the nations of the earth, depend upon our proficiency in agriculture.

3. *Resolved*, That although great improvements in skill and management have been made within the last few years, there still remains a great and manifest deficiency in our knowledge and practice of agriculture.

4. *Resolved*, That the interests of the farming community will be best promoted by the united efforts of farmers in their intercourse with each other.

5. *Resolved*, That we therefore proceed to the formation of an Agricultural Association, by the name of the Genesee Agricultural Society.

The committee on a Constitution produced the fol-

lowing, which was considered and discussed by sections, and adopted, viz:

Constitution.

ART. 1. This society shall be called the GENESEE AGRICULTURAL SOCIETY, for the advancement of Agriculture, Horticulture, and the Domestic Arts, in Western New York.

ART. 2. Any person may become a member of this Society by paying into its treasury one dollar on admission, and one dollar annually thereafter, on or before the annual meeting, during his continuance as a member. Any person paying twenty-five dollars on admission, may become a life member.

ART. 3. The Officers of the Society shall be a President, three Vice Presidents, Recording Secretary, Corresponding Secretary, Treasurer, and seven Managers, who shall, together, constitute the Executive Committee. They shall be elected annually by a majority of votes, and shall have power to fill vacancies in their own body.

ART. 4. The Executive Committee shall appoint local committees in the various sections of the territory embraced by the Society, whose duty it shall be to examine farms and crops which may be offered for premiums, and report the same at the annual meeting, to obtain members, collect all sums due the Society, and perform all necessary labors connected with the operations of the Society, in their respective sections of country.

ART. 5. It shall be the duty of the Executive Committee, five of whom shall constitute a quorum, to exercise a general supervision of the affairs of the Society,—to appropriate the funds of the same, in such manner as shall in their judgment best subserve the interests and forward the objects of the Society,—to call special meetings,—to offer premiums, and to appoint committees to award them,—and to distribute all seeds, plants, books, &c. received for the Society.

ART. 6. The Executive Committee shall determine the time and place and make the necessary preparations for an annual fair, and give sufficient previous notice of the premiums to be awarded thereat, at which time the annual meeting shall be held, for the election of officers, and at which the Executive Committee shall make an annual report.

ART. 7. All competitors for premiums shall be members of the Society.

ART. 8. This constitution may be altered at any annual meeting by a vote of two-thirds of the members present.

On motion of John J. Thomas, R. Harmon, Jr., Thomas Weddle, M. B. Batcham, Lorenzo Hathaway, John Ayrault, Charles Burr, David Bangs, John B. Smith, and Elihu F. Marshall, were appointed to nominate officers for the Society the ensuing year. After a short absence, they reported the names that follow, who were unanimously chosen:

For President—LYMAN B. LANGWORTHY, of Greece.
Vice Presidents—MICAH BROOKS, of Mount Morris, ISAAC W. SMITH, of Lockport, WILLIAM GARBUTT, of Wheatland.

Recording Secretary—HENRY M. WARD, of Rochester.

Corresponding Secretary—M. B. BATEHAM, of Rochester.

Treasurer—HENRY E. ROCHESTER, of Gates.
Managers—OLIVER CULVER, of Brighton, RAWSON HARMON, Jr. of Wheatland, ENOCH STRONG, of Perinton, JOHN J. THOMAS, of Macedon, JOHN B. SMITH, of Ogden, THOMAS WEDDLE, of Greece, JOHN H. ROBINSON, of Henrietta.

After the appointment of officers, the following resolutions were offered and after some discussion unanimously adopted.

On motion of H. M. Ward,
Resolved, That we consider a well conducted and well supported periodical devoted to the farming interests, of the first importance to the advancement of agriculture; that the "New Genesee Farmer" being emphatically our own paper, merits and shall receive our cordial approbation and support; that it shall be considered the organ of this Society; and that it shall be the duty of the officers and members of this Society to make prompt and vigorous efforts to increase its circulation, by obtaining subscribers for the same in their respective neighborhoods.

On motion of Wm. Garbutt, accompanied by remarks from many other gentlemen, the following was offered and unanimously adopted:

Resolved, That the Executive Committee be directed to appoint and make the necessary preparation for semi-annual fairs, for the sale and exchange of farm stock and produce, one to be held on the day next following the annual fair, and the other about the middle of April.

Resolved, That the proceedings of this convention be published in the New Genesee Farmer, and that the different papers in the "Genesee Country" be requested to copy the same.

MICAH BROOKS, Chairman.

E. F. MARSHALL, Sec'y.

Culture of Wheat.

In the southwestern part of Cayuga county, where the slope of the land is not greater than a hundred feet to the mile, from the smoothness of its surface, a stranger, walking through the woods, and not observing the fall in the streams, would be likely to conclude it was nearly level; and we remember, many years ago, to have heard a rover from the hills of a neighboring state, declare that this district was nothing but a maple swamp! Indeed in times of heavy rains or melting snows, there was some countenance for that notion; yet when the land was cleared, and the wheat simply harrowed in,—without any plough having been brought into the field, or any ditch cut to turn off the surplus water,—the crops were often very heavy. The interlacing of the fibrous roots of the trees, through the deep vegetable soil, prevented the young wheat from being lifted out by the frost.

But that state of things has passed away. The stumps with all their roots, have long since disappeared from most of our fields: the muck is much exhausted; and a portion of the harder subsoil has been turned up and mixed with it, rendering the mass more compact and heavy. The consequence is, that the surface water soaks away with more difficulty, and the plants are much more liable to be damaged or destroyed in winter when the ground becomes frozen.

Another cause, however, has had something to do with this deterioration. The lots in Western New-York were generally laid out in rectangles conforming to the meridians and parallels of latitude; and the fields more frequently accord with the original boundaries. It is different, however, with the course of the swales, or natural drafts in the land. These generally cross in a diagonal direction, and the ploughman therefore in forming his lands, has obstructed, more or less, the free passage of the water.

The remedy for this error is plain. First, "cease to do evil;" then "learn to do well." Plough the furrows parallel to the swales, so as to deepen these natural depressions, and make them serve for the collection and discharge of the surplus water. It will frequently happen also that the bottom of each furrow will be a drain of itself, allowing the water to pass under the inverted sod, or soak away more freely through the mellow earth. We may be met indeed with the objection that such diagonal ploughing would cause many short bents; but it is better to have short bents than short crops.

We admit, however, when the swale is narrow and deep, compared with the adjoining land, that a furrow or two well cleared out with the shovel, may be sufficient; but in broad swales, very little below the general surface of the field, such process will be found a very inadequate remedy. We must increase the inequality of the surface by gathering broad lands with repeated ploughings, and then carefully abstain from filling up the deep furrows between them. The benefit of this practice, we know by experience.

These remarks are not intended to prevent a more thorough system of draining by open and covered ditches, which we would recommend to the general attention of farmers. On the upper side of fields especially, open ditches are very beneficial by intercepting the surface water from higher ground. Of what great consequence this would be to many farms, may be known in some measure by observing what floods are discharged during continued rains, by the ditches which are cut along the upper side of the roads; and

reflecting that all this surplus water is a nuisance to the land.

The practice of *ploughing-in seed wheat* is of ancient date; and though it was superseded by the harrow many years ago, it is a practice that ought to be restored. The deterioration of our fields especially requires it. To do it in the best manner, the lands should not exceed nine feet in breadth, nor the furrows more than three or four inches in depth with half the ordinary width. We know that this is a *stouter process* than many farmers are used to; but let them remember that "once done is twice done"—that is, "once [well] done is [better than] twice done [to halves.]"

We may be expected to say something in regard to the benefits of this practice. In the *first place*, except soda, et cetera, and hard lumps of clay, *the rougher the surface the better it is for the young wheat*—the more it is protected from the sweeping winds of winter and spring. In the *second place*, the seed is buried deeper without the danger of being smothered, as the soil lies on it in a *narrow ridge*, and the roots have a longer hold on the soil. In the *third place*, the furrows, at the distance of every eight or nine feet, serve as drains for the surplus water. This is the theory, and experience fully justifies it. In several instances which have come to our knowledge, the wheat, which on old land was ploughed-in, has stood the winter well, while that in the same field which was harrowed in, suffered greatly from freezing out.

There is another thing, however, that must soon be in more of the farmer's attention. Many of our fields have never received any manure from our hands, except a little plaster; and yet they produce crops of wheat in frequent succession. But the young plants have a feeble hold of the soil; and we shall have to exert greater vigor that they may resist the heaving action of the frost. Our barn yards must supply the manure; but sowing early in the season so that the wheat may become strong before winter, will be a wise precaution in this district.

Scalding Seeds before Planting.

Great losses are often sustained by neglecting to *scald seeds* before planting, for some entirely fail to grow, and others remain a long time in the ground, dormant, when they ought to be up and growing.—About a fortnight ago, we planted some seeds of the Dress Vine, and being in haste, we could not take time to scald them—they ought to have remained unscalded. A week after we got time to scald some; these are now up, but the former have not yet appeared.

But we write for farmers as well as gardeners.—A few days ago, we scalded some seeds of the Sugar Beet, and let them remain in the water. This morning we planted them, and many of them were sprouted.

Last year we planted Mangel Wurtzel without scalding; but we shall not do so again: in the wettest land, they germinated freely; but in the driest and best part, they stood far asunder—not half a crop.

We are not aware that any seeds are injured by scalding, though there may be many; and we should be gratified to have extensive experiments instituted on this subject. Some seeds would probably bear more heat than others—we know that some are more hardy than others. The duration of the heat applied should be regulated in some measure by the quantity of water, and the kind of vessel into which it is poured, and the cooling much sooner than others. Several sorts of Indian corn may be safely scalded at once.—Other seeds may not need more than a tea-cupful of water; but let it be running hot. Remember, however, there is a wide difference between *scalding* and *boiling*; and after the water is applied the vessel

should be set away from the fire. On seeds *untried*, it would be prudent to use but little water.

Some years ago, we planted seeds of *Cercis canadensis*. Part were scalded and part planted without that preparation. A difference in the germination of perhaps twenty to one, was the consequence—very few of the unscalded seeds growing.

One week in the advancement of a crop of corn or pumpkins is frequently of great account; and farmer may be prevented from planting at the right time by accidents, or bad weather. In such cases, let them try this remedy.

Brief Hints for June.

Most of the farmer's crops being now sown or planted, the chief care is to keep the ground in good condition and free from weeds.

Mangel wurtzel crop, planted last month, will now need hoeing and thinning. Much of the success of the crop depends on doing this early, before the young plants are checked in growth by being crowded together, or overshadowed by weeds.

Corn fields may be kept clean at less expense than usual, by keeping the weeds completely in subjection, cultivating, and hoeing it frequently. Five or six dressings in this way, may be given with less labor, and with far greater advantage to the crop, than one, when it is done late.

A great deal of labor may be saved, and hoeing expedited, by keeping hoes *sharp* by frequent grinding.

Wheat fields should be weeded. Rye, which is often scattered through them, may now be readily seen; and cockle and mustard when in flower, are easily distinguished and extirpated. Portions of fields, intended for seed, should be also cleared of chess. Red root, if in small quantities, should be very carefully eradicated before it spreads any further; the work should be done immediately, care being taken not to let the seed fall, if any have ripened; and the plants should be collected in a basket, as when thrown upon the ground, the moisture from the earth will cause them to ripen and grow.

Canada thistles should be mowed, to prevent seeding. This formidable weed is most easily disposed of by utter extirpation. Never allow them to put their heads above ground, and they will die. The leaves are the lungs of the plants, and if they are not permitted to breathe, they cannot live. A good way to destroy a patch, is to let it grow till about the time of flowering; that the roots may become somewhat exhausted, then turn the whole under by deep ploughing, subsequently harrowing, and never allow the thistles again to peep above ground. This will be effectual the second, if not the first year.

Rata bags should be sown in the early part of the month.

The curculio will soon commence its operations on smooth stone fruit, and if hogs have not been permitted to run under the trees the past season, the fruit must be constantly examined, or it may be lost.—Spread white sheets under the trees, and by striking or jarring them, the insects will fall, and are destroyed at once. This operation will be effectual if performed twice a day for a month, or less.

Washing sheep.

Is deferred by many farmers, advantageously, till the early part of this month. A very good way of performing the operation, is to provide a large plank box, not quite breast high, and allow a brook of water to run in at one end, and out again at a hole through the bottom of the other, to carry off the dirt. This hole should be just so large that a small part may run over the top, in order to keep the box full. The workmen stand, dry, by the side of this box, and wash the sheep in the water within. A large broad sugar hogs-

head, is much cheaper than a plank box, and may be made to answer the same end.

Bittersweet Ointment for Cows' Udders and Teats.

The best and most efficacious remedy which I have ever found for caked udders and sore teats of cows, is the following:—Take the roots of bittersweet and seethe them in hot water till the strength is extracted, add hogs lard to the extract, and simmer together till the water is evaporated, then let it cool and it is fit for use.

CANFIELD.

Inquiry.

Messrs. Editors, can you or your correspondents inform me of the best method of extracting oil from sun flower seeds? C.

Remarks.—The letter from C. was received just as our paper was ready for the press and we had not time to attend to several inquiries which it contained.—Eds.

For the New Genevise Farmer.

View of the Grasses.—No. 2.

4. *Sweet Vernal Grass.* *Anthoxanthum odoratum*, of the botanists, and *Spring-Grass*, of the English. As it is an early grass in England, and has the fine odor of the so called Spanish bean, the reasons for the English name are obvious. The botanists have named it from the *yellowish* appearance of the spikes of flowers. Soon after it is cut, and even before, it diffuses its fine odor far around, giving to the new made hay that delicious flavor for which it is famed. In England it is said to be one of the earliest grasses to blossom, and to delight in a rather dry but rich soil. In our meadows it is rather rare; its culture ought to be encouraged, if only its fine odor is respected. It is a tall, erect grass, rather stiff, and should be mowed early for hay. This grass seems to have been introduced from England among other seeds. It is not a valuable grass for hay.

5. *Poa pratensis*, L. *Smooth-stalked Meadow grass*, of the English, and *June Grass*, of our farmers.—This has rather a poor reputation in England, and is condemned also here. It has considerable foliage towards the root, and springs up early in the season. It is better adapted, therefore, to early pasturage, and the more so, as it sends up but few culms, and those rather slender. When mixed with other grasses for mowing, it comes to maturity so much earlier as to be unprofitable to the hay. Its flowers are borne on a loose, spreading panicle, on an erect stem. Its roots are *creeping*, and not fibrous, and therefore it binds the soil and exhausts the nutriment, and it becomes rather difficult of eradication. Its later foliage is much less than the early. This grass seems fitted for *dry soils*; probably on account of its creeping roots. It often grows to the height of two feet; but a smaller variety, with thicker spikes and flowers, is more common in open roads and about fields. The smoothness of its sheaths and stems, and the form of the root, make it pretty easy to be distinguished. It is generally considered more detrimental than beneficial by our farmers.

This Poa is now (May 20th) in a very flourishing

state, in the fields, yards, and pastures in this vicinity. Its appearance, nearly ready to blossom, and abounding with radical foliage, indicates its value as a grass for early pasturage, not for mowing.

The kinds of *Poa* are many, and some are very valuable. The generic name is the Greek word for *forage* or *fuel*.

6. *Rough-Stalked Meadow Grass.* *Poa trivialis*, of botanists. This appears to be a more valuable grass than the preceding, and not to be common in the fields. Its flowers are in a rather spreading panicle, and the spikelets rather small; the culm and leaves are rough, and the roots fibrous: so that it is readily known.—The value of the crop cut at seed time, is considerably greater than when in flower. This grass is suited to moist soils, where it forms a dense sward. The English describe it as a favorite grass of horses, cattle, and sheep. As it does not spring up soon or abundantly after being mown, it should be cultivated with other grasses.—*Sinclair*. The seed of these two species have been introduced for cultivation, and are sold at Boston.

7. *Flat-stalked Meadow Grass.* *Poa compressa*, of botanical writers. Two varieties of this grass are spoken of by Sinclair, one of which grows more erect and yields more culms, and is much more valuable.—This variety is not probably in our fields. The smaller variety, and less erect, is common about open hedges, and along banks, and is a fine looking grass, of a dark green. The culm is very much compressed, and the flowers have a web-like connecting substance, and are rather onesided. The other variety forms a fine sward. Neither of them will compare, for utility, with many other grasses.

This is the *Blue Grass* of botanists, and the *Kentucky*, or *Southern Blue Grass*, is supposed to be a variety of it. It is difficult to decide from the English name what grass is intended. A grass of this name is considered very valuable by some farmers, yielding a good crop of the best kind of hay, rich in quality, heavy, and highly relished, especially by horses. We hope to be able to determine what of doubt now exists on this subject in the course of a few months.

8. *Annual Meadow Grass.*—This is the low, small grass that springs up about our houses, and yards, and walks, every where forming, when unmolested, a dense mat of short leaves and culms, of a yellowish green color. Where it is needed, it is considered a beautiful grass, and where not, a troublesome weed. It is called *Poa annua*, by the botanists, probably because it flowers and ripens its seed through much of the year: Early in spring its flowers appear, and late in autumn they are scarcely gone. It is readily cropped by sheep. It can scarcely be called a meadow grass, but is worthy of being known as forming some of our beautiful sward. "This, and *P. trivialis*, are almost the only grasses that will thrive in grass plats in towns."—*Loudon*.

9. *Crested Dog's tail Grass* is a beautiful species, with deeply parted floral leaves, so as to give the long spike a bristly appearance, especially as the leaflets of the culm are awned. The latter crop was found, by the Woburn experiments, to be about half that of the flowering crop, and the nutriment of this grass in flower is to that at seed time as seventeen to ten.—Hence it should be mowed early in the season. It yields much early pasture. It delights in soils rather tenacious and somewhat moist, or in meadows that are irrigated. Raised from the seed, it does not soon come to its full perfection, and is not a grass that can be profitably changed or broken up. Its culm is used in the manufacture of *straw bonnets*. The sward is dense and fine, and with some other grasses, must be valuable for culture.—*Sinclair*. The botanists call this grass *Cynosurus cristatus*, from the *crested dog-*

tail form of the spike of flowers.

10. *Meadow Fescue.* Botanists name it *Festuca pratensis*. It is found in our fields only sparingly—its seed is now imported. It is nearly erect, branching, and its flowers are somewhat inclined to one side. It is called an early and valuable grass by the English, as it yields a larger quantity of foliage than even the Meadow Fox-tail Grass, (*alopecurus*.) so highly commended by them. It contains three times as much nutriment in flowering time as in the seed. It is adapted to a clayey soil. It is found to grow slowly after it has been mowed. It is one of the six grasses recommended by Curtis for pastures.—*Loudon*. Next to the true Fox-tail Grass, it seems to be desirable to make a trial of it in our agriculture. Its seed is being introduced into our country. *Festuca* is from the Celtic for *pasture*.—*Loudon*.

11. *Hard Fescue Grass.* *Festuca duriuscula*, of botanists. The flowers grow onesided and spreading. It is found, in small quantity among our grasses, on light soils, and in rich pastures. It is a pretty early grass, and is in flower here in May. The first crop is said, in the Woburn experiments, to be three times greater than the second, and to be one fifth greater in flower than in seed. The first crop is only one-tenth less than that of Fox-tail, (*alopecurus*.) and two-thirds that of *Dactylis glomerata*, *panicle cock's-foot* grass. In English agriculture, the *Hard Fescue* is considered a very valuable grass, and very important to be mixed with other grasses, to form one of the most valuable combinations of the grasses for hay or pasture. It is probable that the seed will be imported in quantity, as some has already been introduced.

Several other species of *Festuca* are scattered over the country: *F. elatior* L., tall and large in wet places; *F. tenella*, Willd., dwarf fescue, on dry soil in open woods and along hedges, are common, but not abundant. The latter is a beautiful, though not a very useful grass. *F. ovina*, *W. Sheep Fescue*, is a "fine, short, sweet" grass for sheep, and affords "delectable mutton," while it affords a thick turf: it is beginning to be cultivated. C. D.

(To be continued.)

From the Maine Farmer.

Signs of the Times.

Although we have put a political caption to the head of this article—or rather, one which politicians love to use, we are not about to enter the battle ground of either of the contending parties as they are at present organized. We wish, however, to call the attention of the friends of our own country to some of the signs now rising in the distant horizon, which indicate that before many years there will be a change in the existing tariff, and that those who live south of Mason and Dixon's line, and who so bitterly opposed that portion of the tariff which afforded encouragement to Northern Manufacturers and Northern Wool Growers, even to threatening a dissolution of the Union, will ere long change positions and beg right heartily for such an alteration as shall also protect them—aye, protect them in their own staple products, viz: cotton, tobacco, and hereafter, silk. And we much mistake if they will not then be willing to shake hands with their brethren of the North, and unite in forming such a schedule of duties as shall be mutually beneficial to all sections of the Union. This is what they ought to have done before—this is what nature itself points out should be done. The two extremes of our country, embracing as it does, such an extent of territory—stretching through such a variety of climate, are well adapted to supply the wants of each other, and one would suppose that it would be an object for each to study the other's welfare in accommodating each other. The North is well adapted to the growth of wool, lumber, hay, oats, and to manufacturing. The South to the production of cotton, rice, silk, sugar, &c. Why not then arrange our tariff that each branch shall be encouraged? But the South, by their opposition to those points which were beneficial to the North, have virtually said, we care nothing about you—we had rather trade with Europe—she will accommodate us on most any terms—and we are not going to assist in building you up when our mother country

is so kind to us. So off with your duties upon wools, &c., or we will blow up the Union. English too, when she saw that she could accomplish two objects with one act, namely, sow dissension among and have our duties reduced, sung cheerily the song of free trade to us, but at the same time shut our ports to the whole world, except in such a and in such times as it would be for her own particular benefit to open them or change her restriction. So, to keep the peace among ourselves, the duties, woolsens, &c., were reduced—little or no duty put on silks, and some other articles. But to the sign, what are they? We see, by the American Farmer that there is to be a grand convention of tobacco growers in Washington city next month. What is the matter? Why it is found that this article, which is an immense article of trade throughout the world, is restricted in some countries. France, for instance, refuses to encourage her own people in this business to great detriment of the growers of the United States and while we have been so good natured as to suffer her silk almost duty free—she has been so ill natured as to hamper our tobacco trade in such a way, as to give her own people the monopoly. And Southerners begin to think that it will be best to down the gates upon their silks, unless they change their course in regard to tobacco. Besides the culture of silk is coming into vogue in the South and may be made so extensive as to put Europe in shade, if it could be encouraged, or the French other silks kept back.

Again, England is waking up to the culture of cotton in her East India possessions. She has sent a agent into this country and has engaged nine practical planters to go and take charge of as many plantations in India. They are to have a salary twelve hundred pounds per annum each. Native laborers can be employed to any extent in India for dollars per month. Great Britain has appropriated twelve thousand pounds to push forward the enterprise, and it will not be long before the Northern manufacturer can obtain his cotton from India, cheaper than from Georgia or Alabama. In addition to Texas will be pouring it into the market also. Not the Southern planter cry out for a prohibitory on cotton? We have no doubt of it—and for one should be willing to give it, provided they would consent to such an arrangement that all sections should be mutually encouraged in the crops and manufactures peculiar to their climate and situation.

Our farmers, who control the ballot-box, must judicious legislation, provide a stable home market for the products of their industry. We beseech the weight well the fact, that there was brought into the United States and sold, no less than one hundred and fifty-seven millions' worth of foreign goods in the 1839. And in this connection, remember the duty on American flour in English ports, on the 1st of April, 1840, was two dollars and fifty cent barrel. This is more than the flour is worth in wheat growing sections of Ohio, Michigan, Indiana and Illinois. Shall our own agricultural interest no countervailing protection? We imported last year, twenty-one millions of silks, duty free. Instead of sending abroad twenty-one million of specie, or its equivalent, to pay for these silks had manufactured that amount more of goods at least ten millions of provisions, in one shape or another, would have been consumed in the operation and all the profits of the manufacturers, the product of the raw material, mechanic labor, and the consumed by all, would have enriched our ownizens.

Our mechanics, such as shoemakers, blacksmiths, carpenters, tailors, and the like, have a deep interest in the encouragement and protection of their manufactures. Indeed their interests are the same with nearly all other classes, who must depend on the productive industry of the country for their own individual prosperity. Hence, the great national interest of encouraging, by all suitable means, man, woman, and child, to be both industrious and economical. Hence our republican family should so disgrace themselves as to madly run into debt Europe 157 millions a year, for worthless aristocracy, and then have one half of the property of the Union sold under the hammer to foot the bill. Sensible men should insist on an efficient protective tariff, that shall cut off this disastrous extravaganza. If the rich will have one hundred millions worth of silks, wines, and the like, from abroad, let them into the national treasury at least forty millions, which can be well expended as a common school fund, and been done with the surplus belonging to the State of New-York. This will be a tax upon luxury for the benefit of education, general science, and intellig-

THE FLOWER BOX.

JUVENILE RECITATION, WITH A BASKET OF FLOWERS.

me ladies, I've roses and posies to sell,
 a the flower boy kio an hereabouts very well;
 my sweet daily task I am constant and true,
 and I gather my flowers while wet with the dew.
 I look how they sparkle with the bright morning gem,
 nicely bunch'd up, too,—not one broken stem.
 They'll keep fresh and fragrant, I'm sure, the day through,
 I'll buy a few bunches, dear ladies, pray do.
 You buy my primroses and lilies so fair—
 I'll see—what a sweet little bunch I have there.
 I have all sorts of nosegays, to suit every one,
 from the shade, paly-flowers—some bright from the sun.
 I have Miss. here are lilies, and violets, too,
 they are meek, lowly flowers, just suited to you;
 his half-opened bud, too, has something to say—
 "Be modest, retiring—though cheerful and gay."
 Here's the hide away cowslip, you'd know its sweet breath,
 without looking for it, to twine in your wreath.
 Oh! good humore lady—so merry and gay—
 his bunch will suit you. What a splendid display!
 Double roses, and scarlet bells, mixed with bright green,
 with sweet yellow jessamine peeping between!
 I see the moss rose buds, and wild flowers, too;
 come, ladies, for charity's sake, purchase a few.
 I've fragrant sweet briar, and here's the mignonette,
 'tis the freshest and sweetest you've ever seen yet.
 Morning glories, and stars, scarlet runners so gay,
 or those who rise early and are busy all day.
 Or the careless and idle I've a sly cunning gift,
 'tis bunches of hops, mixed with speed-well and thrift;
 my way of reproof, too,—just to give them a bunch,
 rumpet creepers and sloe berries, all in one bunch!
 the fretful and headstrong, only see what a show—
 I've ger lilies, passion flowers, and snap-dragons, too!
 With snow balls and snow drops, for keeping them cool,
 'tis as much as to say, never let passion rule
 or gad-about-gossips in other folk's matters,
 here's touch-me-not, thistles, and loose-strife, and wallars.
 Young spinsters of fifty I think I could please,
 With love-lies-a-bleeding, and sprigs of heart's-ease,—
 one teasing fine coxcomb, with sweet williams, gay;
 sweet-balm, johnny-jumpers, and bob-run-away!
 or young men of forty, here's a bunch that would do,
 bright mary-gold, with a blue-bell or two—
 or a few ladies tresses, their hearts to ensnare,
 and a sweet polly-anthus, with bright-golden-hair,
 ragged-ladies, romantic vines, fly-traps, and old-maid.
 With jump-up-and-kiss-me, in purple array!
 adies-slippers, and tulips, of every bright hue,
 and for-get-me-nots, smiling in bonnets of blue!
 'then bachelor's-buttons, with ladies-in-green,
 With rue, and some bitter-sweet, bunched in between—
 and if these will not suit them, I've something more yet,
 a little rose-mary, and a great bouncing-bet!
 or pert, forward Misses, I've all sorts of stocks,
 With flowers of elders, and a little green-box!
 or a neat, sprightly girl, then—what would you think
 of that bunch of white-lark-spice, with a rose and a plink!
 or patriots, I think, I've a bunch that will do,
 some flaunting night-rockets, with flags red and blue.
 To please our young patriots, too, I will try,
 here are plenty of flag for the Fourth of July!
 For members of Congress, your stenors so tough,
 I am sure I have throat-wort, and lung-wort enough;
 For stock-jobbers, too, here's a bunch gives a hint,
 Some fine golden crowns, with plenty of mint.
 For studious young Misses, who love much to learn,
 I've ever-green-laurels, with thyme, sage, and fern.
 For your regular folks, sun-flowers and phlox,
 With evening primroses and bright four-o'clocks,
 I've bright crown imperials for such as tell truth,
 And flowers immortal, for virtuous youth.
 For such as look forward to Eden's pure bowers,
 Here are evergreens, changeless, and amaranth flowers
 For Sunday school children—ye high favor'd youth,
 So blest in the sunshine of heavenly truth!
 I've branches of palm, with Lebanon's pride,
 With the fir, and the boxwood, and the myrtle beside.—
 The lily of the valley, in purple arrayed,
 With the sweet rose of sharon, in glory display'd!
 I've a great many more of each different sort,
 By their name and their nature some moral is taught;
 The language of flowers has bright things to say;
 I do wish you would take a short lesson to-day.
 Come buy my sweet posies, 'twill charity be,
 'Twill help pay of I did, and will surely suit me.

N. Y. Weekly Messenger.

The town of Springfield, Ill., has become a city

Care of Horses.

There are a great many farmers who take but poor care of their horses in the winter season. In the short days they have water before dark, and then have to go without until nine or ten o'clock the next morning, or if they have water early in the morning, they will not usually drink, as their time of thirst is past.—Horses seldom refuse water after they have eaten their evening meal, though if they do not have it then, they will usually drink but little the next morning until after eating. So if a horse will not drink early in the morning it is no indication that he has not been thirsty the previous evening.

We have been particular in our observation on this point. We have turned a horse out to drink at nine or ten o'clock in the evening, and seldom known him to fail of drinking heartily. Then, for experiment, we omitted to give him water at night, but attended to it in the morning before he was fed, and he would seldom drink. It is best for animals to have free access to water at all times, as is generally allowed, then they ought surely to have a supply immediately after eating, when they are usually thirsty; though the superficial observer who finds that they will not drink early in the morning may think that all has been well.

There is not a man probably, who has not at times been very much in want of drink, and yet, without being able to obtain it, his thirst has gradually abated. In this case the juices from other parts of the body are, in a measure, put in requisition to supply moisture when it is wanted, so by an equalness the thirst is abated or done away, but there is a deficiency of moisture in the system—a drought, less severe, but more extensive, which, if experienced daily will prove unfavorable to health and strength; and in animals it will injure the growth of the young, and operate against the fine, healthy condition of every creature. They must have water when they need it or they will not drink; like men, they do not eat and drink according to fashion and custom.

Some farmers will use their horses all they are warm and sweaty, and then put them up, perhaps in a cold barn, without covering them with any thing to keep them warm; this evil is often increased by allowing the horses to drink freely of water, while warm, in order to save the trouble of watering them after they have stood till cool; a great many horses suffer in this way, and some are ruined. For a man or beast to be inactive and exposed to cold after exercise and perspiration, is destructive to health, and will destroy the strongest constitutions. Every man knows the importance of guarding himself against exposure to cold after perspiration, and how a drink of cold water in this state, will send a chill through the whole frame. Though a man is not like a horse, he resembles him in his ability to do a great deal of labor, with proper management, and in his liability to disease if his tender frame is not guarded with care.

It was observed in the Farmer some months ago, that it was better for a horse to have a place in the winter where he could stand upon the manure, and walk round at ease, than to be confined to a stall and stand upon a hard floor. But in this case, as the manure will accumulate under his hind feet so that he will stand uneasy, unless it be levelled frequently so that it will be as high or higher under his fore feet.

Currying horses is very much neglected by some farmers. This operation is very important, as it contributes both to the pleasure and health of the animal. In some cases this business is hardly attended to, being performed only a few times in the course of the winter.

Many a farmer's horse that is now stupid and lazy, and of a miserable appearance, would, under the care of a good hostler, without extra keeping, become so changed in his appearance and spirits, in a few months, though performing the same amount of labor, that his owner would hardly know him.—*Yankee Farmer.*

Popular Errors.

Messrs. Editors.—It would be amusing, were it not an incontrovertible proof of an ignorance that ought not to exist among any body of men, certainly not among the farmers of the United States, to read or hear the strange, not to say ridiculous, notions which some of them entertain. These errors in most cases, may be traced to two causes: ignorance of the most common laws of nature, or inaccuracy of observation. With your leave I will point out a few of these, some of which have long been naturalized among us, and some of which appear to be of indigenous origin.

One of these errors which occur to me now, relates to the fecundation of plants, and may be found on the 17th page of the Silk Grower, in a letter to our hor-

uculture. After a long argument to prove that the impregnation of Indian corn does not take place from the pollen as is usually supposed, and as is so easily demonstrated, the writer goes on to say: "Oh, no, this is much too clumsy and bungling work to be believed in. The effect, [impregnation] is, doubtless, produced by scent or smell; for, observe, the ear is constructed, and is at this season, so guarded, so completely enveloped, that it is impossible for any matter whatever to get at the grain, or at the chest of the grain, without the employment of mechanical force." The error, in this case, arises from the supposition that the pollen must be conveyed to the grain, whereas it is only necessary the fertilizing dust should reach the silks, which are the organs of impregnation belonging to the ear.

In another agricultural paper, I not long since noticed a paper from a farmer on the culture of corn, in which he earnestly contended that the impregnation did not take place by the pollen, but that certain filaments or threads, invisible, except at particular times, extended from the blossoms to the silks, which effected this fecundation. These spider's webs, for such every attentive observer is aware they must be, must be about as effectual in the process of impregnation as the 'scent' in the first writer's article.

On a par with these, is the theory of transmutation, or the change of one species of plant to another during the period of vegetation. Of these believed transmutations, that of wheat into chess, is perhaps the most common, and certainly the most pernicious, as the belief has the effect of rendering the believer careless in cleansing his soil from the weed, or sowing pure seed in his field. Few men would believe that cutting off, or bruising the top of a young oak would change it to a sugar maple; or that the same operation performed on a young pine, would convert it into a tamarack; yet either of these suppositions is just as feasible and consistent with the law of nature, as that any other plants should undergo a similar transmutation. There are some flowers that may be changed by the action of mineral agents in the soil, from one color to another; but the seed of such a flower, the chrysanthemum for instance, never produces a rose or a geranium.

Another common error relates to the migration or hibernation of birds, particularly the barn swallow, or the chimney swallow. It is supposed by many that these birds descend to the bottom of ponds, lakes, &c. in the mud of which they lie torpid during the winter, as it is well known the toad, frog, and lizard do, and as the bat does in caves or other dark recesses. These birds migrate, as their presence in the equatorial regions, during their absence from ours, conclusively proves; and the idea of their being torpid has been countenanced by the fact, that the flight of most migratory birds takes place during the night.

In many parts of the country there is an impression among farmers, that a kind of vegetation takes place among the white grubs, the product of which is the common blackberry bush. That a species of vegetation some times takes place on the bodies of insects, is doubtless correct; and the larvae of the Melolontha, and the vegetating wasps are examples of this. The plant produced, however, is a species of the fungus tribe, and not any way related to the higher order of plants.

In the last number of the sixth volume of the Cultivator, is an attempt to show that the Hessian fly and the Chinch bug, two of the greatest enemies to the wheat crop and the farmer, that this country has, are the same insect, or rather that they have the same parentage or origin; and from the remarks there made, it would seem that this opinion is quite common among our southern agricultural friends. This, it would seem, is the doctrine of transmutation applied to animals, instead of plants, and appears to involve the same absurdity. In a reply to an objector in the American Farmer, the advocate of this transmutation of animals, gives the following as proof and illustration:—

"Agricultur may think it strange and contrary to the order of nature, that the large white grub worms could be transformed or turned to grasshoppers. But such is the fact. A gentleman of highly respectable standing in this country, who caught one of these long white cut worms, and placed it in a box with some loose earth, and after it was confined for some days, he examined it one morning, and found it had changed or produced a grasshopper. Is it more strange for a cut worm to be transformed into a grasshopper, than that a Hessian fly should deposit an egg which should produce a Chinch bug?"

That the large or long white grub is the larvae of the May bug, is a fact so easily ascertained, and well known, that the mistaking of that insect for a grass-

hopper, though it might not affect the standing of the gentleman alluded to, must have a tendency to impeach his knowledge of entomology. The grasshopper, when it first appears, is an insignificant, feeble animal, and it is only by long feeding and growth, that it becomes formidable. The May bug or Melolontha, on the contrary, emerges from the earth, like the other beetles of full size, and commences the business of procreation with little delay. To suppose that such a large and formidable insect as the red headed grub, should be the parent of the tiny grasshopper, is having the mountain labor with a mouse, in good earnest.—The Chinch bug and the Hessian fly are both perfect insects, and to suppose that they can have the same parentage is preposterous. Insects in their several stages, appear under such different forms, that unless traced through the series of transformations, mistakes may well occur; but in their perfect state, as the Chinch bug and the fly, such mistakes are unnecessary. The theory is as incorrect, as to suppose that the progeny of the same Darbani bull should in one case be like himself, and in another a rhinoceros.

Perhaps I have occupied enough of your valuable columns for this time. I may possibly refer to this topic hereafter.—*Cultivator.* M. S. D.

The Flowers of Spring.

Pulox is a very interesting genus to the florist. The smaller, or more humble species, are evergreen, London to the contrary, notwithstanding; and *P. subulate* (mountain pink) and *P. Setucca*, cover the ground like a mat. The dwarf species also come first into flower. When planted on a mound, the better to exhibit their masses of bloom, the sorts just named are ornamental in a very high degree. Indeed we have nothing more brilliant at this period.

A variety of the latter, (*P. nivalis*), from Georgia, requires some protection in winter, but it deserves it; and when in full bloom, so numerous are the flowers, that it resembles a lake of snow.

P. reptans, nearly red,—and *P. diraricuta* varying from white to different shades of pale purple,—are also very showy. The latter often abounds in our woodlands.

The Japan Quince, splendid and continuing long in blossom,—is almost an indispensable ornament to the garden. The flowers of one variety are scarlet-crimson; those of another, creamy-white, slightly tinged with red; and by grafting, an intermixture of both kinds appear on one bush. There is also a double flowered variety.

The holly-leaved Barberry (*Berberis Aquifolium*) from the region of the Rocky Mountains, is an evergreen with large pinnated leaves. Scarcely exceeding eighteen inches in height, it is safe under the snows of winter; but like the Tree Pæonia occasionally suffers in its blossom-buds from the severe frosts of early spring. Its yellow flowers are presented in masses from the ends and axils of the branches,—showy, ornamental, and singular.

Narcissus biflorus; whitish yellow—*N. jonquilla*, (true jonquil,) deep yellow—and *N. poeticus*, (poet's narcissus,) pure white with a crimson rim—and a double white variety of species,—are all very sweet and beautiful.

Nasturtium crassifolia, with its naked stems a foot high, crowned with rose-colored flowers, is worthy of a place; and *Corydalis subulis*, so rich in its foliage, may grow by its side. Both will do best in a shady border, as well as *C. formosa*.

Silene pennsylvanica, pale red, is neat and pretty; *Verbena multifida*, pale blue-purple, increases the variety of the border, and *Pedicularis allouca*, adds the delicate whiteness of its corymbs.

The white Asphodel of two species, exhibits its star-like blossoms; *Hemerocallis gracilis*, its yellow bells; and Ragged Robin, its lacinated flowers of a fine red, and very double.

Iris cristata, pale blue-purple, and *I. lacustris* of a rich violet, both variegated, form themselves into tuft

ed beds. The Florentine Iris displays its white blossoms and diffuses its odors. The Flower de Lis more gaudy, expands into blue and purple; and the Siberian Iris, equally tall and fine, has the attraction of greater neatness.

Penstemon gracilis with evergreen leaves, is one of the smallest and prettiest of the genus. *Delphinium tricornis*, dark purple, is the earliest of the Larkspurs. *Dodecatheon Meadia* in three varieties, passes from white into red-purple, and by its shape reminds us of the Cyclamen. The double Ranunculus glitters in yellow; and the purple *Verbascum* daily presents new flowers in succession as the stem ascends.

The Tulip in many varieties gives brilliancy and fragrance to the border; and only abstains from blue or violet in the selection of its colors.

The Pæonias add their splendors. Three double varieties of the Tree Pæonia, all very different, come forth near the close of the month, besides three double varieties of the officinal Pæonia, all varying in color; three double varieties of the Chinese herbaceous Pæonia still more interesting, will soon appear, with one double Pæonia *paradoxa* bearing purple flowers. Having generally no seeds to mature, double flowers are more durable; and possessing all the fragrance and delicate coloring of single flowers, why should we not desire them? There are however, many single varieties and species of the Pæonia now in bloom.

A few favorite shrubs may be noticed. The Japan Globe Flower is of the richest yellow; the snowball and double cherry of the purest white; but nothing can excel the dwarf Almond in its varied tints. The Lilacs are a glorious family; but the red is decidedly the finest of the common kinds. Scarcely inferior is the Siberian Lilac, presenting long masses of bloom; and though the Persian is smaller, it is worthy of a place.

Aquilegia atro purpurea is the most beautiful Columbine that we have seen—but we have not room for further notices this month. X.

The Proper Time for Cutting Timothy.

We are much obliged to our correspondent "*A Cayuga Farmer*," for his remarks upon this subject. The time for mowing Timothy, which he considers the best, viz: "*when the seed has attained its size, and the blossom is gone*," is not much later than in fact intended by the writer on the grasses. Having seen much Timothy stand too long, as he thought, and as the observations of others had shown, he designed to call the attention of farmers to a somewhat earlier mowing than he believed to prevail. This led him to use a stronger expression than the case made necessary where an earlier mowing is practiced. The close of blossoms, and not the beginning, would doubtless be the safer and more profitable time, and is the time actually intended. He is glad to hear that farmers have in any section come to cut this grass sufficiently early; he would encourage a cutting neither too early nor too late.

It must be a great defect, arising from early cutting, if the hay is "very liable to be dusty and smoky," as our correspondent states; and such a result is to be prevented by thorough curing. The grass will then have more juice in it, which will be dried in it, if cut not too late, and this will not pass to the maturing of the seed, but be retained in the hay. The roots, too, will the sooner send up new shoots, when the grass is cut before maturity.

We trust that "*A Cayuga Farmer*" will be satisfied that we are laboring for the same end that he intends, and that with our acknowledgments to him, the brotherhood will be careful to cut their grass about the right time. D.

The Curculio.

The fruit-garden is a delightful promenade in summer and autumn; but too many freeholders forget about it in the planting season. Where the enclosure is large, plums, apricots, and nectarines, ought to stand in a quarter by themselves, so that the hogs be confined among them at the time when the Curculio is most active. This suggestion had not occurred when we planted our fruit-garden; and the benefit be derived from the presence of the hogs, are in measure, lost. As a remedy, however, we have screening and other small grains, under some of the trees; and a few days ago we went to ascertain the result. A sheet was first spread under several trees remote part of the garden which had received no attention, and from these we got more than twenty these insects; but not a solitary one was caught where the hogs had trodden the ground hard.

Since that time we have frequently gone into fruit garden with a basket of grain in one hand, and mallet in the other, the whole drove of hogs follow. Having jarred the tree with the mallet, by striking against the stump of a limb cut off for the purpose, strewed the contents of the basket without delay. This insect is timid, and its danger in lying on ground at this juncture is not merely ideal, for a full trampling succeeds; and if it should not be instantly crushed, we hope it will not soon return to the

Red Root.

This truly formidable weed in our wheat crop, we perceive, yearly increasing. When it first gains possession of a field, it may be removed by carefully pulling it, while in flower. After it gets possession, it is difficult to destroy it, as the seeds ten remain several years dormant, especially if buried deep by the plough.

One of the best methods of treating it, is to harrow or lightly plough the wheat stubble immediately after harvest, to cause the fallen seeds to vegetate, and destroy the young plants the next season by summer crops, which should be repeated for a year or two when the land may be summer fallowed for wheat. Successive crops of buckwheat are said to be advantageous. We hope those of our correspondents who have had experience in the destruction of this weed will communicate to us the methods and results.

* *Lithospermum arvense.*

Child, on Beet Sugar.

We have already presented our readers with a brief notice of the new work on the culture of the Sugar Beet and the manufacture of Beet Sugar, by David Lee Child. As it is the result of three year's close observation and experience, we purpose, as soon practicable, to comply with the frequent requests of readers for information, by publishing some interesting and valuable extracts. In the mean time we recommend our subscribers at large, who may have opportunity, to procure and examine the work, as it contains many useful hints relative to the culture of the sugar beet, which would apply to this and other root crops, when cultivated as food for domestic animals.

For the New Genesee Farmer To make Oyster Corn Cakes.

Take one quart of green corn rasped with a coarser grater, two teacups-full of new milk, one teacup-full of flour, mix them together and add two eggs well beat up, season the latter with salt and pepper, a bake upon a griddle. These cakes afford as good imitation of the taste of oysters as can be made satisfactorily. The corn should be such as is most suited for roasting or boiling. C.

Hints on Gardening for June.

The month of May has been unusually propitious for the gardener. No long continued rains have greatly retarded his operations; and no late frosts have deflected his labor. Most gardens have been planted in good season, and every thing seems to promise abundant crops of vegetables, fruits and flowers. Much remains to be done, however, and the Gardener still be active and watchful, in order to ensure a reward for his labors. Much of the work deferred for last month may, with advantage, be performed early this month.

Cucumbers, Corn, Beans, Beets, Carrots, Turnips, Peas, Lettuce, and some other seeds, may still be sown where required.

The middle or latter part of the month, is a good time to plant *Cucumbers* for pickles, as they will escape the bugs, and grow faster and bear better than if sown early—*Beets*, sown this month, will be better winter use than if sown early—observe to *sow seeds two or three days* before sowing, else they will not vegetate in dry weather. *Turnips* require rather moist land, and if free from insects or worms, they will do well, sown this or next month. *Cabbage, Cauliflower and Broccoli plants* should be transplanted when of sufficient size as directed last month.

Celery, sown early, and transplanted into a nursery last month, may now be set into the trenches.—The soil for celery trenches should be deep and rather rich, with an open bottom. If the soil is not deep, make the trenches shallow, so as to allow six inches of good earth, mixed with rotten manure at the bottom; on which set the plants, six inches apart in a row. Water freely and frequently in dry weather, and shade the plants for a few days after transplanting, placing a board over the trench. Do not commence earthing up till the plants have made considerable growth, and be careful not to let the earth get into the heart of the plants.

Thinning Crops.—The young crops of vegetables now begin to grow rapidly, and where too thick, plants should be thinned as early as possible. A few beets, onions, and such things as are used early in the table, may be left and thinned as required for use. *Weeds* will now spring up in abundance, and must be destroyed while young. Some persons pretend to believe that weeds are an advantage, as a shade to young crops in dry weather; but this a great error and a subtle refuge for indolence. It is well known that weeds rapidly absorb the moisture and nutriment from the soil, and on examining beneath the surface in dry weather it will be found that the ground is much drier where covered with weeds than where kept clean. As to this, their unsightly appearance, and the difficulty of destroying them when full grown, and we think all will admit that *weeds must be destroyed while young.*

Stirring the ground.—Nothing conduces more to the growth of crops than frequent stirring of the ground, especially in this necessary in dry weather, and where the soil is inclined to bake or become hard.—The ground is frequently stirred in dry weather, and will be found moist, while that which is not stirred, will become perfectly dry. We say then, *stir often,* with the hoe, rake, cultivator, whatever you please, but you want great crops be sure and *keep stirring.*

Watering must not be neglected in dry weather, if all water is used, it should stand all day in a tub or cistern, exposed to the Sun. Evening is the best time for watering.

The *flower Garden* should of course be kept free from weeds, and the soil loose and fine. Perennial and annual flower seeds may now be sown. Annuals, sown early, will now begin to need thinning and

transplanting. Take up the plants with a scoop trowel and it can be done without injury. If delicate kinds are removed, they should be shaded from hot sun. Water every evening in dry weather.

Sings on Fruit Trees—Again.

These unwelcome visitors are now making preparations for another attack on our fruit trees near this city. We have just noticed some leaves of a pear tree on which are numerous small thin eggs like scales, adhering closely to the leaf, which we have no doubt will soon produce our slimy enemies. We had but little time, and could not discover the perfect insect, (which is doubtless some kind of a fly or moth) but as the eggs are newly deposited we believe the depositors may be discovered; and we hope some of our friends will capture a specimen or two, in order to gratify our curiosity.

Early Premium Vegetables

DELIVERED AT THE ROCHESTER SEED STORE.

First half doz. cucumbers, May 7th, by Richard Oram, East Mendon—for the Eagle Tavern. Second half doz. cucumbers, May 8th, by Gen. Ellwanger, Rochester—for the Arcade House. First peck green peas, June 1st, by William Elliot, Greece—served up at the Arcade House. M. B. B.

Rochester, June 1st, 1840.

EARLY WHEAT, AND TALL RYE.—Gen R. Harmon of Wheatland, brought into the Farmers' Meeting on the 23d inst., some stalks of Wheat already in head, three feet high. It is called the White May Wheat from Virginia.

Mr. Isaac Moore from Brighton, brought in a root of Rye with stalks six feet high.

Essex Agricultural Society.

We are indebted to HENRY COLMAN, Commissioner for the Agricultural Survey of Massachusetts, for a copy of the transactions of the *Essex Agricultural Society* for 1839. It contains the address delivered before the Society by Allen Putnam, of Danvers, reports of the several committees to award premiums, with the statements of the several successful competitors, and other interesting matter. It also contains the speeches of Daniel Webster and Prof. Silliman before the Agricultural meeting in Boston, with copious additional notes by the commissioner. We hope hereafter to enrich our columns by extracts from the work.

The Farmer's Cabinet.

This excellent periodical, (published at Philadelphia,) has passed into the hands of Kimber & Sharpless, as publishers, and James Pedder, as Editor.—The well earned character of the publishers, as business men, and the high reputation of the Editor, as a practical man and a writer, gives the best assurance of the future excellence and success of the paper. The "Dialogues between a Father and Son," one number of which we have transferred to our columns this month, from the pen of the Editor, are in themselves worth more than the price of the paper, one dollar per annum.

Pork Eating.

MESSES. EDITORS.—Do we not eat too much pork in this country? I have been subject to the rheumatism for several years past. From August to February last, I left off the use of pork, and the rheumatism left me. From February to April I used pork again, and my rheumatism returned. From April to this time I have dispensed with pork again, and am again free from rheumatism. Farmers are much subject to rheumatic complaints, and if any particular kind of diet is calculated to cause or increase disorders, they ought to be informed on the subject. I therefore men-

tion my own case as a hint to others, in order that any who may be afflicted as I have been, if they feel disposed to do so, may try the same experiment, and observe the effects.

CANFIELD.

Ohio, May 23, 1840.

Culture of the Grape.

MESSES. EDITORS.—A correspondent in the fourth number of the *Farmer* wishes to know the best method of raising the grape. My way is to trim these vines that have been growing some years, in the winter, so as to prevent the sap from running in the spring, which is apt to retard their growth. When the buds begin to start, I rub all from the old part, leaving those on the last year's growth only which will produce grapes. After they have grown to the size of shot, I clip the ends of the vines and free them from branches, leaving a few of the thickest which I keep free from branches, so that in the fall I have a number to raise a crop from the next season. By the middle of August I take the leaves from the vines that have grapes on, and by this means get them ripe before frost. If the buds have not been taken off when they first started, the surplus branches of the present year's growth may be clipped off in the forepart of June. By pursuing this course, my grapes ripen without being frozen. C.

Port Gibson, N. Y.

The English Markets.

The following account of the prices of agricultural produce in England, is gathered from papers of the last week in April, received by the British Queen.—We copy from the *Yankee Farmer*.

Wheat \$2.06 per bushel; Barley \$1.18; Rye \$1.12½; Oats 75 cents; American Flour, in bond, \$6.75 per bbl.

The prices of fat stock, in Smithfield cattle market, per lb. 'to sink the offal,' are quoted as follows: prime large Oxen 10 cents per lb; second quality 9; coarse and inferior Sheep 9; prime South Down; 12; Lambs 15; Large Hogs 12.

New Irish Butter, per 112 lbs. \$22, 55; Cheese, \$22, 56; Bacon (new) \$14; Ham, Irish, \$16 a 50; Potatoes, per ton of 2240 lbs. \$14, 10; Hay, coarse, meadow, per ton, \$19; fine upland and Rye Grass \$21, 50, clover Hay \$24.

The price of wheat bread in London, was from 18 to 20 cents, per 4 lb. loaf.

Wool.—British fleeces were quoted at 30 to 38 cts. per lb; Flannel Wool 25 a 31 cts. per lb; Blanket Wool 11 a 25; Merino fleeces 38 a 42c; German Saxton and Silesian 1st and 2d Electoral, 74 a 120c. per lb; Prima 56 a 74c; Secunda 42 a 56c; Moravian, Bohemian, and Hungarian Electoral 90 a 116c; Prima 56 a 72c; Lambs 48 a 96c.

Cattle Bones are quoted at \$15 up to 30 per ton, and the *Farmer* remarks that large quantities of bones have been purchased in the United States at \$4 per ton, for the English market.

Errata.

The "A. B. C. of Silk Culture" on P. 86 of this paper should be credited to the *Farmer's Register*.

In the article on the culture of fruit P. 82 second column, second paragraph, for *Alexander's Gravenstein* read *Alexander, Gravenstein*.

☐ The two last paragraphs on P. 99 do not belong to the article with which they are placed. They are properly inserted on P. 84.

In last month's paper page 69, column 3, line 2, for *the evergreen*, read *this evergreen*. Page 69 col. 3 line 6, for the period (.) insert a comma (,). Page 69 col. 3 line 10 read *Amariyilde*. Page 69 col. 3 line 13, *Z. Atamasco* is synonymous with *Amariyilia Atamasco*; *S. lutea* is synonymous with *Amariyilia lutea*. Page 69 col. 3 line 14, for *Atomasca* read *Atamasco*. Page 69 col. 3 line 23, *Sternbergia lutea* is one name, and should have no comma between. Page 69 col. 3 line 31, for *increase read increases*. Page 69 col. 3 line 5 from *bottom for Hytice* read *Haticc*. Page 69 col. 3 line 20 for *excell read excel*. Page 72 col. 1 line 28, all the words from "As this little," &c. to the end of the paragraph were quoted from J. Burnett's letter, and should have been so marked by the compositor. Page 71 col. 3 line 23, for *Surphus* read *Syrphus*. Page 71 col. 1 line 27 for *allumnous* read *albuminous*.

From the Farmers' Cabinet.

Dialogue between a Father and Son.

PART I.

Supposed Conversation between a Proxident and Improvident Farmer, and their respective crops, stocks, &c.

Frank.—Father, which is the most profitable breed of sheep for the farmer? I should suppose the largest, as a sheep is a sheep you know, and a large one is of more value than a small one.

Father.—A prudent man will advise with his land on that subject.

Frank.—But can his land advise with him?

Father.—Yes, and the lessons which a farmer is taught by his land, are not soon forgotten, as, according to the old adage, "ought not to be." I sometimes fancy that my crops converse with me, when I visit them of an evening, and if I could do justice to those fancied dialogues which I seem to hear, and could commit them to paper, they would, I think, make a pleasant addition to your book.

Frank.—O, do try, "nothing is impossible to a willing mind," you know.

Father.—Most opportunely quoted the text—now for the sermon.

We will suppose then that a slovenly procrastinator is visiting his fields on just such a glorious evening as the present, in just such a fruitful season as we are now blessed with. He goes up to the field, No. 1, which is wheat, and begins—

Grabb.—Good evening; fine weather this; but I don't think you look quite as well as you did the last time I visited you.

Wheat.—I wonder how I should—do you not see how I am choked with weeds? how the thistles are goading me with their spikes, and the rag weeds are taking the food out of my mouth, while the bind weeds are dragging me down to the earth; and how that I am smothered with evils innumerable?

Grabb.—But I allowed you a fallow and plenty of manure; you ought at least to have been able to cope with the weeds.

Wheat.—You forget that "the earth is own mother to the weeds, while she is only mother-in-law to the crops that are planted in her bosom;" besides, you talk of a fallow—why this great thistle on my right, and which has one of his spikes fixed in my side, has just informed me that he is one of the progeny which was reared in this same fallow of yours,—his parent being the identical thistle under which the farmer sat on horseback, and escaped a drenching, while his neighbors were wet to the skin! You seem to have forgotten that "one year's seeding is seven year's weeding."

Grabb.—Ah well! I'll get these weeds pulled.

Wheat.—As you said a month ago, and will say again, and never do it!

Frank.—Excellent! But you never fallow or dung for wheat.

Father.—Nor have I ever such fine thistles. I always dung for green crops, and insure two things at the same time—more food for the cattle, and of course, larger dung-hills. My object is to retard the growth of the wheat, that it might be strong in the stalk, and I therefore do not encourage its lavish growth by manure and fallow. Now for No. 2.

2. Corn. **Grabb.**—Why you look very sickly; I thought you would do better, judging from the appearance you put on at first coming up—how's this?

Corn.—Ask yourself! You thought you were cheating me, when you sowed without manure—a favor you always promised me: I relied upon that promise and came up, with the expectation that I should find it when I needed it; but after sending my roots below in search for it, I find your promises are false—you complain of my sickly look! I can only say, if you had as more to feed upon than I have, you would not have shelled the three lower buttons on your waist-coat! Grabb tucked the shucks into the holes and walked on.

Frank.—I now find that crops can advise, and admonish too; but could not the farmer do something in the way of top dressing to remedy a part of the evil?

Father.—Yes; but he had no manure.

3. Barley. **Grabb.**—Ah! you'll come to nothing.

Barley.—I thank you, and return the compliment. But what did you expect when you sowed me after once ploughing, on a stiff and wet soil? "Nothing venture, nothing have." I only wish that you had to work so hard as I do for a living. You would then feel for me.

4. Oats. **Grabb.**—Well, I think you might do a little better than you do, if you would try; why, I shall not get the value of the seed back—that's too bad!

Oats.—Now, that's thrice bad of you! You know that you have had six grain crops in succession from the land on which I am sown, with not a spadefull of manure of any kind for the last six years! Why, even the weeds have been stayed out, and you have put in practice the lazy farmer's recipe for ridding his land of weeds—"make it so poor that they will not grow!" Now that's practical farming without theory.

Grabb.—But what shall I do for want of the straw, which I depended upon as fodder for my cattle during next winter?

Oats.—I—that all your dependence for the next winter? Why your cattle will be ready to eat you! and you will have to practice the other part of the recipe, "to prevent cattle from dying of starvation—kill them." But I give you warning: neither they or you must expect any thing from me; if I can hold my own, 'twill be as much as I shall do.

5. Clover. **Grabb.**—Why you look healthy and well, but how is it that you have made so little progress in height! There's Farmer Sykes' clover as high as my knees, and will be soon fit for the scythe! but I am impatient in every thing!

Clover.—That's a true word, although not spoken in jest. Why you seem to forget that as soon as I had made a little progress in growth, you turned in all your starving cattle, horses, and sheep, which not only cut up the branch, but also the root!

Grabb.—Ah! that I was compelled to do to keep them from starving—but you had all the benefit of their manure while they were feeding you.

Clover.—You call that manure? why it was, the greatest part, nothing but worms and bots—and the little good that remained was soon earned off by the grasshoppers and bugs, which were about as much in want of it as I! My fear is, that the hot weather, which seems now to be setting in, will scorch the land, so unprotected by foliage, and dry up the scanty crop which is left, before it is high enough for the scythe—and then, what do you think your horses will say to you! If you had done what Farmer Sykes did, you would have deserved his success; you must remember, how, that instead of feeding off his young crop, he top dressed it with a compost of lime and earth and dung, which had been carefully prepared in the winter and well pulverized; by which, not only his present crop is doubly benefited, but it is also preparatory to an autumn sowing of wheat on the lay.

Now put this and that together, and calculate the result. First, two tons of hay per acre, the first cutting; one ton per acre, the second, with a capital afterwards for his dairy; and if wheat is sown by the 29th of September, a yield of forty bushels per acre might be expected at next year's harvest; and this is not all—for after the wheat is carried, the land will be turned, and the clover stubble, perfectly rotted, will form an excellent seed bed for buckwheat, with the expectation of a heavy crop. Now I will leave you to calculate the value of my second crop, (remember you have already had the first cutting, and a severe cutting it was,) and of course you do not expect much at the third; while seventeen bushels of wheat per acre, next harvest, will be quite as much as you have any right to expect; and common justice will not allow you to sow buckwheat after.

Grabb.—Why, you are one of Job's comforters!

Clover.—But I cannot see that you have any claim to the character of Job—for "In all this, Job sinned not," remember.

6. Potatoes. **Grabb.**—Well, I don't know how it is, but while others are digging new potatoes, it does not appear that I shall ever have any to dig! I think I may as well leave you to your fate, for you'll certainly never be worth the labor of cleaning.

Potatoes.—Now you cannot be ignorant of the fact, that for two months after the crops of others were up, you were only talking of planting yours; and all the while the weeds were growing on, what you called your fallow, until some of them were as high as your head, and full of seed; we were then tumbled in all together, and have ever since been struggling for the mastery; but you have now sealed our fate, and must take the consequences. 'Twas fortunate for you, was it not? that your father lived before you, for he would find it difficult to live after you!

7. The Cows in pasture. **Grabb.**—Well, you have more grass than you can eat, however, you can't grumble—that's one comfort.

Cows.—Grass, do you call it?

Grabb.—Yes I do; and what do you call it?

Cows.—Why, we were just saying, it would puzzle a Philadelphia lawyer to say what it was; but judging by the smell as well as the taste, it might be called garlic, without offending against the statute of truth.

Grabb.—Well, you are all alike! Did't I let you feed off the crop of clover, almost before it was out of the ground?

Cows.—That's a fact! Indeed we were at last obliged to dig for it, and you will feel the effects next winter, or we are no conjurers.

Grabb.—Ah, I had need be a conjurer to know how to satisfy you all; but what have you done with the sheep?

Cows.—What, these large bodied, long woolled animals, for which you gave in exchange, your small breed, which, even they, could only just keep body and soul together, by picking the short herbage of the pasture? Oh! we have done nothing with them, but they have at last been able to do something for themselves, for finding it impossible to subsist on such short commons, and that they were growing less every day, they sought for a hole in the fence, and by writing until they were reduced so much in size as to be able to creep through, they at length passed into your wheat, with the intention of returning after they had filled themselves, but this they could not do then, and it is not probable that they have attempted it since, so you had better look for them, for ere this, they have cost you as much as they are worth, in the damage they have done to the wheat crop.

Grabb.—Well, 'tis no use to try to do any thing more, and so I'll go straight home—no, not straight, for it I do, I shall get amongst the porkers, and they are grumblers by profession.

9. Pigs.—**Porkers,** did you call us? 'Twill be long before we have any pork about us, with our present mode of living—call us grumblers, for so we are, and with reason; we wonder you are not afraid to meet us after dark, for we are but the ghosts of things that have been. There is this consolation in it, however—our lives will be spared, for we shall never be worth the trouble of killing; indeed, that, in a little time, would be no "murder," as it would be like one of your neighbors, who killed his pigs to save their lives!

10. Grabb.—Ah! well, here come the Horses, they are the only generous animals upon a farm; but where are ye all going in such a hurry!

Horses.—We have come at last to the resolution of no longer starving quietly, so we are going in a body to break over the fence into Farmer Clement's clover; we know where the weak place is, for we have heard you promise for the last three months to get it mended, and, of course, it is not done yet. We do not intend to break into your own clover, as that would be punishing ourselves the next winter, for we calculate there will not be more food than enough for us all, if we eat stock and block of the whole farm.

By this time the farmer had reached his house, and going in, said to himself, there is no comfort out of doors, let us see if we can get a little within—wife, bring the rum bottle and a pipe. Talk of the independence of a farmer's life indeed! 'tis all a hum—here am I, with the best intentions in the world—

Wife.—Not the value of a cent! all your intentions never grow into actions! Now just sit down, and I'll sum up the thousand and one promises that you have made me to do the necessary repairs about the house—and to begin with the roof of the dairy, which was stripped off by that storm last autumn, and there it remains in the same state to this day—

Grabb.—Take care, let me get to bed, out of the way!

Frank.—Oh! thank you; but now to make a perfect picture, we should visit his fields with a good farmer and husbandman.

Father.—That indeed would be much more agreeable, and some day we may do so; but it is now late—let us get to bed, as Grabb said, but not for the same reason, blessed be God!

PART II.

Frank.—Well, Father, you see the book is right—"nothing is impossible." When shall you be ready to give us the other side of that picture which you yesterday drew for Farmer Grabb?

Father.—The twin brother of the above proverb, is, "nothing like time present"—by means of both, we may perform prodigies; so let us try at once. We will take our neighbor Sykes for the conversation of the picture, and suppose him going into his fields to "meditate at even tide."

No. 1. Wheat.—Ah, Farmer, I am glad to see you; 'tis not often that you are absent for two evenings, I was afraid you were sick.

Sykes.—Why, you see I had promised my wife to attend to some little alterations about the house, and that has prevented me from seeing you as usual—we must

care of the women. you know, or they will not for us—but you look well.

Wheat.—Yes, thanks to your bounty. I am now using on that magnificent coat of manure which you gave to the young clover last spring, and just at the time too, when it is needed, for if you will examine the plants on your left, you will find that the ear is fully formed in the blade, and that they are all *ficci* ters too.

Sykes.—That's capital! Now that comes of being to the soil.

Wheat.—And now, will you cast your eye over the rows, and say if you see any piece of wheat in the country so uniform and regular in its growth? The height of the plants on the sides of the ridges, is, if anything, of a deeper green than those on the top or bottom of the ridge—a sure prognostic at this season of the year of a heavy crop. The field just below is sown after a whole year's fallow, with dung; but there the order is reversed, for the plants which are in the furrows on the sides of the ridges, are weak and yellow. And only trace the rows of green spots, straight lines across the fields! they were created by the heaps of dung which remained unsown weeks, until they were overgrown with weeds, which was termed a fallow! The weeds now sturdy witnesses that the cultivation and dung had done much more for them than for the wheat, yet it is probable that Farmer Grabb expects to get no profit from his crop!

Sykes.—I do not think that we will either have a reap or profit. Your present appearance warrants a careful harvest, by the blessing of a good season, and I am delighted with the prospect. Can I do any thing more for you?

Wheat.—No, but there is something that you must do for yourself—you must increase the size of your stock yard—I go for nothing less than forty bushels per acre.

Corn. **Sykes.**—Well, I am glad to see you look so much better; your first appearance was very sick and sickly, and my neighbors wanted to persuade me it was because I sowed the seed with Buckmaster's drill, but I knew that could not be the cause, for I never saw any machine operate better; I only in the handles were a little longer and lower.

Corn.—My sickly appearance was owing to your a good management.

Sykes.—Why, how could that be?

Corn.—You know that you are in the habit of ploughing a *leette* deeper every time, and thus a small portion of the sterile subsoil was brought to the surface, and in this the seeds were sown; and the roller the drill passing over, (a capital invention,) pressed them so closely into the clay, and rain falling immediately after, and following the track of the roller, the surface became so hard and dry, it was with difficulty that I could penetrate it, and for a few days I now I looked miserable; I, however, soon got to the nure below which you had so bountifully supplied, and now I feel as though I could mount to the height ten feet. If the season should be favorable, you put me down for 110 bushels per acre. I am in fear of the weeds which I see springing up around you, you'll take care of them, I know.

Sugar Beets. **Sykes.**—Ah! Mons. Sugar Beet, how do you do? How do you like our country and nate! How do you like the exchange?

Beets.—Ah! Mons. Farmer, I like your country! I like your fine, light, and sunny days—they make *charme*; I like the exchange too, 'tis all in favor of America. But what for you not make sugar? I like plenty sugar—more than in France; great remuneration! sweet recompense—no trouble, all pleasure, all profit.

Sykes.—I am not prepared to make sugar this year, next year I will do it, without any fear for the result. In the mean time, unlike most other speculations, the growth of the sugar beet is about the most profitable of which a farmer can grow for winter food; horses, cattle, sheep, hogs, and poultry, all are fond of it; and better than all, it adds, to a surprising degree, to a farmer's comfort during the dreary time of winter, it enables him to meet his animals without reproach, and gives him the means of fattening his stock, at a time that others are starving; and he can rear house fowls, which, about Christmas, would bring a fine price in the market. In the introduction of this crop, notice, there has been no mistake, and in substituting it for a crop of barley, I have relieved the land of an exhausting crop, and adopted one that is ameliorating; requiring neither fallow or dung, when the land is in good heart—so farewell, Mons. S. Beet.

Beets.—Adieu, Mons. Farmer. "vive la Republique America!"

4. Potatoes. **Sykes.**—Well, the progress which you have made in growth during the last two days, surprises me! But never, for a moment, have I doubted the fulfillment of my most sanguine expectations respecting this, my favorite crop.

Potatoes.—But you have left us nothing to do but to grow; your labors began last autumn, when you ploughed the land deep, and laid it high and dry for the winter; and before others could get on their land in the spring, you had planted your crop. Then again your judicious management in not moulding us up—we have only to go on to maturity, while the crops of those who keep moulding, never know where to be, or what to be at; for just as they have discovered the height at which to form the bulbs, comes the hoe, and buries them so deep as to ruin them; they are therefore compelled to begin to form their bulbs higher, to be within the influence of the sun, leaving their first formed bulbs to their fate; but exhausted in a degree, by the double exertion, they are weakened, so as not to be able to bring the higher crop any more than the lower, to perfection, and so both are reduced, both in quantity and quality, having many small and useless bulbs; happy, however, if they escape a third, or even a fourth moulding. Men are very silly to suppose that potatoes do not know their own business best; their fear, that without moulding, they would form their crops on the surface, is very childish; why, even they themselves would not be guilty of any thing so thoughtless; their desire is, only to find the spot where they shall be within the reach of the sun's rays, and men need not fear that they will get above it. All the crops that are not moulded up are free from those half formed bulbs, or warty excrescences, which are so apt to deform those which have been nursed into the rickets; and there are very few small bulbs, for the root is not anxious to form more than it knows it can bring to perfection.—By your excellent management, you will secure a harvest ten days earlier than your neighbors, a crop larger in quantity, and superior in quality, and which will command an extra price in the market—put us down for 750 bushels per acre.

5. Clover. **Sykes.**—Well, this is the finest crop of clover in the country, and will be soon fit for the scythe.

Clover.—No thanks to me, for you made me what I am, by that magnificent covering of compost, by which I was literally buried alive. If the season remains favorable, I can promise you two tons of hay per acre the first crop, one ton per acre the second, and a capital aftermath for your dairy, and if that won't yield you a profit, why then quit, and go a fishing!

6. Cows in Pasture. **Sykes.**—Well, Fanny, Kitty, and Judy, what have you done with Bill?

Cows.—Oh! he lies under yonder hedge, complaining it is easier to lie down than to rise, and thinks it hard to have to accompany us twice to the yard when we go to be milked—indeed he will soon be too fat to be healthy.

Sykes.—Well, I thank you all live in clover, and the return which you make of ten pounds of butter each per week, is a proof of your gratitude for good treatment.

Cows.—We are very happy, and the proverb says, "without comfort you can't make butter." But our happiness is owing to your excellent care of us, especially in dividing our pasture into three compartments, and changing us often—if men were but sensible of the advantage this is to the dairy, their cows would not be compelled to lie in the same pasture until the very atmosphere is contaminated with their filth; the milk would keep longer, and the butter would not be so soft in hot weather, to say nothing of the trifling circumstance of about two pounds of butter a week from each cow, in favor of your plan.

Sykes.—Well, I never heard cows talk so reasonably before! and I wish you would read Grabb a lecture upon Dairying; but unless he is the merest idiot alive, he must sometimes have heard and read, and felt the reproachful looks and low murmuring of his poor, half-starved animals in the garlicky meadow below; but he is sunk so low that it must be up-hill work for him, I know.

7. Sheep. **Sykes.**—It is remarkable, that just as I had determined to dispose of my Leicesters, and purchase sheep of a smaller breed, more suitable for short pastures, that Farmer Grabb should decide upon parting with his Southdowns, on the principle, that "as a sheep is a sheep, you know, (glancing his eye at Frank,) a large one must be more valuable than a small one!"—(Frank.) (That's a capital hit at me! I shall never forget the lesson which I have been taught) so our exchange was no robbery.

Sheep.—To us it was "ad'tother way," as Farmer A-field says, but Grabb's sheep decline it was robbery, rick robbery; for they have been robbed of the means of existence.

Sykes.—To me it has been advantageous, and has proved the truth of the calculation on proportioning sheep stock to land; "The same land which carried indifferently, forty-five long woolled sheep, maintained in good plight one hundred and fifty Rylands." I am therefore satisfied with the exchange.

8. But here come the horses. Well, my beauties! why, where are ye going to that frolicsome mood?

Horses.—Oh, we have eaten our supper, and are now going to rest in the upper pasture; we say to rest—Farmer Grabb's horses go to labor, for as they get no food in the stable after their day's work, they are compelled to gather their supper before they cut it, and hard work it is with a bite so short; and after laboring all day at the plough, and all night at a short bit, 'tis no wonder that it costs him more in whips than in corn. We shall therefore be ready by break of day for whatever you will put us too, for "horses who are kept above their work, their labor is play."

Sykes.—Well, take care now, and if you meet Grabb's horses down the road, don't go to play with them, for they have something more serious to think of. Hullo! where did that groan come from!—"And yet another, and another," as the man says in the play. Oh! 'tis only the hogs, who have over-eaten themselves again; this is butter making day, and they are always a little uneasy after that."

Hogs.—And so would you be, if you had swilled as much as we have; but you men have no feeling for poor dumb brutes!

By this time Sykes had reached his house, and entered, singing the last verse of that fine old song. "No glory I covet;" it runs thus—

How vainly through infinite struggle and strife,
The many their labors employ!
Since all that is truly delightful in life,
Is what all, if they will, may enjoy."

Sykes.—Well, wife, your elegant supper table looks very inviting.

Wife.—Frank, get your Father's slippers.

Sykes.—And my bestermost "Blouse," I mean now to "rest and be thankful." And Frank, after supper, and while your mother and sister are "plying their needles," you shall read to us "The Yellow Shoestrings," which I read when I was a boy; and to the golden rule contained in that little book, "Nothing is impossible to a willing mind," I owe the chief blessings of my life, don't I wife?

Wife.—Well, I confess that if it had not been for your perseverance, the difficulties which opposed our union would never have been surmounted, and that, I guess, would have been unfortunate for both of us.

Sykes.—Well, after that, I think we may go to supper!

Frank.—Thank you, Father, these stories will make a beautiful pair of portraits, and shall be preserved by me with gratitude; together with those beautiful lines which you gave me yesterday, and which have since been continually in my thoughts—

For every evil under the sun,

There is a remedy, or there is none;

If there be one, try to find it,

If there be none—never mind it.

* The French Frock, a most convenient and suitable dress for farmers.

Drainage of Lands by Steam Power.

The drainage of lands by steam power has been extensively adopted in the fens of Lincolnshire, Cambridgeshire, and Bedfordshire, and with immense advantage. A steam engine of ten horse power has been found to be efficient to drain a district comprising 1000 acres of land, and the water can always be kept down to any given distance below the plants. If rain fall in excess, the water is thrown off by the engine; if the weather is dry, the sluices can be opened and the water let in from the river. The engines are required to work four months in the twelve, at intervals, varying with the season, where the districts are large; the expense of drainage by steam power is about 2s. 6d. per acre. The first cost of the works varies with the different nature of the substrata, but generally it amounts to 1l. per acre for the machinery and buildings. An engine of forty horse power, with scoop wheels for draining, and requisite buildings, costs about £4000, and is capable of draining 4000 acres of land. In many places in the fens, land has been purchased at from £11 to £20 per acre, which has been so much improved by drainage, as to be worth from £60 to £70 per acre.—*Durham Advertiser*.

Genesee Agricultural Society.

On another page of this paper will be found an account of the proceedings of the farmer's Convention at Rochester, and the formation of the Genesee Agricultural Society. It will be seen that the constitution provides for the appointment of local committees to attend to the affairs of the society, in every town or neighborhood where sufficient interest is felt in the cause, and suitable persons can be found to attend to it. It is very desirable that the organization should be completed as speedily as possible, in order that proper arrangements may be made for the fall exhibition. Circulars will be sent in a few days to such as are known to the Executive Committee, and any other persons who desire a committee in their neighborhood, and think they can obtain a good number of names for membership, are requested to address a line to the Corresponding Secretary.

M. B. BATEHAM.

Rochester, June 1st, 1840.

To Correspondents.

We have received a number of communications, chiefly occupied with matters foreign to the objects of this paper, touching on disputed points in party politics,—commending our journal, &c. Our object is chiefly to improve the culture of the soil; and the statement of facts, experiments, and suggestions on this subject, will of course, be of more real value, than the mere expression of opinion on other subjects. We hope those correspondents to whom these remarks apply, will excuse us, if, in place of their communications, matter more practical occupies our columns; and to remember the anecdote of the man who promised to give the country such weather as was wanted when the people unanimously agreed what it should be. When our readers all agree in relation to what we shall publish, we promise to satisfy them; and in the mean time we request them to exercise forbearance with regard to this subject.

We have received a communication from W. S. T. in reply to "Cultor" on the subject of rearing calves, in which he very justly objects to the frequent practice and bad economy of imperfect feeding. But as his remarks are directed more particularly against feeding on "skim milk" alone, and not against the method pursued by "Cultor," and as his communication is of some length, we hope he will excuse us for not inserting it.

"CINCINNATUS" is received and we will endeavor to profit by his advice. We hope to hear from him again.

ANNETTE informs us that she is to be absent some weeks on a visit to New England, so we have taken the liberty to defer her communication till next month, in order to make room for the agricultural proceedings, &c.

JUVENS will also appear next month. K. ditto.

A HINT.—We wish our correspondents would bear in mind that we always want a title or head to each article in our paper; and writers should always place a heading to their communications, and confine their remarks to one subject until the heading or title is changed. Some of our correspondents endeavor to embrace several subjects in one communication, without any heading, and the consequence is, we have to divide and revise it all; or, what is more common, reject the whole.

M. B. BATEHAM will commence this month and spend several weeks travelling in Western New York and Upper Canada. He hopes to have the pleasure of calling on a goodly number of our friends and readers, in order to obtain more personal and particular knowledge of the condition of agriculture and horiculture in this region of country. Such intercourse will doubtless be mutually beneficial, and better fit him for the duties of his station.

English Seed Wheat.

One or two bushels each, of eight or ten of the finest new kinds of English Wheat, have just arrived from England, and will be distributed to the members of the Genesee Agricultural Society previous to next fall's sowing.

Lost Numbers.—Post-Masters will please inform us if any subscribers have not received their papers correctly, that we may send them again.

Seed Buckwheat for sale at the Seed Store by M. B. BATEHAM.

A DURHAM BULL CALF.

OF FINE FORM and undoubted pedigree, for sale at a reasonable price, by THOMAS WRIGHT, Madison, Wayne co., 5 mo. 17th, 1840. Also as above, some pure Berkshire pigs of the Bement stock.

NEW ARRIVALS!

JUST received at the Rochester Seed Store by the Steam Ship British Queen from England, a large supply of best purple top Ruta Laga, and a general assortment of English and Scotch Farm Seeds. Merchants supplied at very low prices. M. B. BATEHAM. June 1st, 1840.

NEW BOOKS.

CHILD'S work on Beet Sugar; Bull's Farmers' Companion; the American Swine Breeder's Companion; Bridgeman's Garbener, new edition; and a fresh supply of sundry other valuable books, for sale at the Seed Store. M. B. BATEHAM. June 1st, 1840.

THE THOROUGH BRED HORSE, YOUNG HENRY.

THE PUBLIC are informed that the above thorough bred Horse, raised by H. Wooley, Long Island, and now owned by the subscriber, will stand at O. Culver's, Brighton, Monroe co., and will be let to mares at fifteen dollars the season. Enclosed and good pasture will be provided, and all possible care and attention will be paid to mares brought from a distance and left with the horse; but no responsibility for accidents or escapes, should any occur.

Pedigree.

Young Henry was got by Henry, the competitor of Eclipse out of Sandhole, by Eclipse. Young Henry is now six years old on the 1st of June next; he is a splendid figure, with his points finely developed; he is a dark sorrel, and somewhat over 16 hands high. For further particulars, apply to OLIVER CULVER, Brighton, Monroe Co., N. Y., May 20, 1840.

IMPROVED BERKSHIRE PIGS.

THESE subscribers has on hand, and will have, during the Summer, Pure Berkshire Pigs—also a cross of the Leicester and Berkshire. These Pigs are equal to any in the State, and will be sold as cheap as any. Rochester, May 1st, 1840. AMOS SAWYER.

IMPORTED ENGLISH DRAUGHT HORSE [SAMSON,]

WILL stand this season at the subscriber's stable in Palmyra, on the 1st, 2d, 12th, 13th, 14th, 15th, 16th, 26th, 27th, 28th, on the 13th, of 6th month. At John Hoath's, in Puttford, on the 1th and 14th of the same month. At Hall's corners, in Wheeland, on the 6th, 7th, 8th, 20th, 21st, and 22d, of the same month; and at George Mar's, in Mendon, on the 9th and 23d of the same month. Again at home on the 9th, 10th, 11th, 12th, 13th, 23d, 24th, 25th, on the 12th of 6th month. At Hoath's on the 1st, 15th, and 20th of the same month. At Hall's corners on the 3d, 1th, 5th, 17th, 18th, and 19th, of the same month; and at Marsh's on the 6th and 20th of the same month. Again at Hall's corners on the 1st, 2d, and 3d, of 7th month, and at Marsh's on the 4th of the same month.

Samson was imported by his present owner, with a view to improve the breed of Agricultural and Draught horses in this country. His stock, of the two seasons he has stood here, promises to possess ample share of muscular power, so much needed in the various purposes to which horses are applied. They may be found in the neighborhood of Palmyra, Henrietta, Mendon, Wheeland, &c., and farmers are respectfully invited to call and see for themselves. Terms—\$10 each mare, for the season, to be secured by approved notes, payable on 1st of 11th month next. In case any mares should not be with foal, the owner may have the privilege of putting them next season, or if the horse should not stand in this part of the country, to have half the money returned. JOHN ROBINSON. Palmyra, 1840.

THE IMPORTED HORSE, ALFRED.

WILL stand this season, commencing on the 6th of May at the old Norton Farm, East Bloomfield, Ontario county, N. Y., as follows, viz: From Wednesday, May 6th, to Tuesday, May 12th; from Wednesday, May 20th, to Tuesday, May 26th; from Wednesday, June 3d, to Tuesday, June 9th; from Wednesday, June 17th, to Tuesday, June 23; from Wednesday, July 1st to Tuesday, July 7th; and at Mr. Forden's, near Geneva the intermediate time.

TERMS.—\$10 each mare, for the season, to be secured by approved notes, payable on the 1st of Decemr. er. Should any of the mares prove not to be with foal, the owners have the privilege of putting them the next season, if the horse remains in this region, or, in the event of his removal to have one half the amount returned.

THOMAS WEDDLE.

East Bloomfield, April, 1840.

AMERICAN COMET.

THIS full blooded improved Durham Short Horn Bull, is now at my farm, in the town of Greece, 6 miles from Rochester.

Pedigree.

Color, white, calved April, 1837, bred by Thomas Weddle, is by Imported Rover, (1816-) dam, Pinrose, by Pioneer (1821-) gr. dam, Providence, by Candor, (107-) gr. gr. dam, by Ketton, (346-) gr. gr. gr. dam, by Expectation, (217-) g gr. gr. gr. dam, by Col. Trotter's Magnium Bonum, (282-) gr. gr. gr. gr. gr. dam, by Lt. Chapman's Son of Punch, (122) gr. gr. gr. gr. gr. dam, by Ralph Grimson's Bull, by Changer's son of Favorite, (2-2-) gr. gr. gr. gr. gr. gr. dam, by Earl of Carlisle, was by Rockingham, (2550-) dam, Cherr by Wonderful, (700-) gr. gr. dam, by Alfred, (23-) gr. gr. dam, by Chilton's old Red Bull, &c. &c.

TERMS.—\$5 each cow.—Further information may be obtained by addressing me at the Post Office, Rochester.

THOMAS WEDDLE.

April 23, 1840.

AGENTS

FOR THE ROCHESTER SEED STORE

A full assortment of seeds, put up at the Rochester Seed Store, may be found at each of the following places. Subscriptions will also be received there for the "New Genesee Farmer and Gardener's Journal."

Table listing agents for the Rochester Seed Store across various locations like Buffalo, Lockport, Albion, etc., with names of agents and their addresses.

Rochester Seed-Store, March 1, 1840.

ROCHESTER PRICES CURRENT.

CORRECTED FOR THE NEW GENESEE FARMER, JUNE 2, 1840.

Table of current prices for various commodities like wheat, corn, oats, barley, rye, peas, beans, potatoes, apples, cider, flour, salt, pork, beef, eggs, butter, cheese, lard, tallow, hides, sheep skins, wool, pearl ashes, pot, hay, grass seed, clover, flax, and plaster.

English Seed Wheat.

One or two bushels each, of eight or ten of the finest new kinds of English Wheat, have just arrived from England, and will be distributed to the members of the Genesee Agricultural Society previous to next fall's sowing.

Hoing Ruta Baga.

An inexperienced cultivator of the ruta baga, may commonly be known by his leaving the plants about four times as thickly together as they ought to stand. On ground of any tolerable degree of fertility, the distance of one foot at least should be allowed between the roots, except they be in drills three feet asunder, when they may be suffered to stand a little nearer. If sown broadcast, eighteen inches square should be allowed to each root. If the land is rich enough, they will be so much larger in consequence of this increased space, as considerably to increase the amount of the crop, and greatly to diminish the labor of harvesting.

We have observed, on the best soil, well manured previous years, where the crop had been sowed broadcast, and two feet square allotted to each plant, roots weighing from ten to fifteen pounds, and yielding about fifteen hundred bushels an acre.

If the soil be poor, the above remarks will not of course apply, and the roots must be much nearer together, as they cannot be made to grow large, and number must be made to compensate, in a small degree though it be, for a want of magnitude.

Packing Butter.

The increased price of butter in autumn, as well as its scarcity in winter, renders the best mode of packing it a matter of some importance. There are several particulars of minor importance to be attended to, to which greater or less attention is given by good butter makers; but the two leading requisites without which there must be failure, and with which there cannot easily be, are *clean vessels*, and *thorough working*.

The importance of the former, in obtaining perfectly sweet butter, must be evident to every one; hence the necessity of washing vessels by scalding; and where they become rusty from disease, of employing chloride of lime.

In order to keep the sweetness, it is indispensably necessary that every particle of buttermilk be worked out before packing down. This is ascertained when none ceases to flow from it. Inexperienced butter makers generally perform this part of the operation very imperfectly. Work the butter four times as long as you think necessary, and then perhaps you will have half completed it. When it is thoroughly worked, pack it down, by beating, in a strong pot, cover the top with an inch of very strong brine, and keep in the coolest part of the cellar, and you need not fear its becoming injured by keeping before next winter.

Sunflower Seed Oil.

MESSES. EDITORS—Wm Wood, an Oil manufacturer here, has made 27 gallons of good oil from 19 bushels of Sunflower Seed, without hulling, with Williams & Pinder's Hydraulic Press. He also made 2½ gallons of oil from 2½ bushels of common Pumpkin Seed,

The above was manufactured in the usual way of managing flax seed, except that the crushed seed was not subject to as much heat in the revolving cylinder, before it was pressed. S. W.

Waterloo, June 15, 1810.

The Revolving Horse Rake.

This is an implement of very great utility, especially on large farms and smooth lands. The expedition with which hay can be gathered with the revolving rake renders it a great saving of labor; and not infrequently it enables the farmer to secure his hay in good order, which otherwise would be damaged or destroyed by wet. They are fast coming into very general use.

In answer to several inquiries, we mention that these rakes are for sale at the Seed Store in this city, and at various other places in Western New York—price from eight to ten dollars each.

For the New Genesee Farmer.

Bad Seeds.

It not infrequently happens that after bestowing much labor upon the preparation of, and seeding his ground, the farmer is sadly disappointed in finding too scanty a growth of plants to ensure a sufficient crop. With the field beet especially, failures so often occur, that even an honest seedsman must expect occasionally to shoulder the reputation of "never having any old stock on hand;" that is, of selling old seeds for new.

From a little experience, I have concluded that it is best to have as much charity as possible, at least until we have ascertained who the culprits are; and if it should so happen that the mischief has occurred through our own negligence or inexperience, why, then, we may complain as loudly as we please.

This spring I planted half an acre with two pounds of Mangel Wurtzel, from the Rochester Seed Store. In a few days, some scattering plants made their appearance. I waited patiently for some time afterwards, when my friend, John Robinson, from Palmyra, (who, by the way, is one of the best farmers in our section,) called on me, and said that my success was much better than his; he did not expect one-tenth of a crop; and inasmuch as our seed probably came from the same hoghead, we unanimously came to the conclusion, that while it was certain that Bateham could not be to blame, there were some men in London who were no better than they should be.

Well, accidentally, I could not work in the Mangels for nearly two weeks after; when I was surprised to find a fair number of plants just peeping through; and, from their weak and thin appearance, evidently wearied with their long journey to the surface, which they never could have reached, if the soil had not been light.

I resolved to be careful in future in what manner my seed was planted. WM. R. SMITH

Macedon, 6 mo. 29, 1810.

Genesee Agricultural Society Notice.

Circulars containing the Constitution of the Society, &c. have been sent by mail to the different Post Masters, and to many known friends of agriculture in several counties in Western New York, with a request that they will use their exertions to obtain the signatures of members, and report the same to the Secretary of the Society as soon as the 20th of the present month. It is hoped that every friend of improvement will give the subject prompt attention; as the Executive Committee desire to make early and liberal arrangements for the coming Fair; and in order to make out a list of premiums, &c., it is necessary to know about what number of members can be obtained. Any person who can obtain signatures, or who wishes to sign, and who has not seen or received a circular, can apply to the nearest Post Master for one, or to the Secretary of the Society, or to the New Genesee Farmer Office, and the Rochester Seed Store. II. M. WARD, Sec'y.

Rochester, July 1, 1810.

THE EXECUTIVE COMMITTEE of the Genesee Agricultural Society will meet for the transaction of important business, on Tuesday, the 28th inst., at 11 o'clock, A. M., at the Arcade House, Rochester.

II. M. WARD, Sec'y.

Notes on European Agriculture.

[The following extracts from the *Southern Cabinet*, indicate excellent judgment in agriculture, and it is with pleasure that we present them to our readers.]

As a general remark, I am disposed to believe that Europe in general, and England in particular, is more favorable to the cultivation of wheat, and other grains, which go under the denomination of corn, than the United States, with the exception perhaps of our Western country; but that our own soil can, by a proper system of tillage, be rendered twice as productive as it is at present. That improvements in implements of husbandry can be more easily introduced among us than in Europe, where it is difficult to induce the laborers to lay aside the old heavy ploughs and wooden toothed harrows, which we have abandoned for half a century; and when I have seen the miserable bores, spades and rakes, used by the peasants of France and Austria, I have sometimes wished that a revolution (not political, but agricultural) might sweep them and their wooden shoes into oblivion together, to be known only as the relics of a clumsy, if not a barbarous age.

In fine breeds of horses, horned cattle and sheep, suited to the different climates and pastures—and in the careful manner which these distinct varieties are kept separate, Great Britain takes the lead of the world. The black faced sheep of Scotland differs so widely from the varieties found in the downs and low countries of England, that they would scarcely be recognized as the same species. The same may be said of the black cattle driven from the highlands to the markets of Edinburgh, when compared with the different breeds found in the Lothians of Scotland, and in the level, rich counties of England. Each variety is confined to localities suited to its size and habits.—The mountain cattle and sheep would not succeed well in low countries, nor would the breeds of the downs thrive on the mountains. No traveller in England who knows a horse from a donkey, can fail to admire the distinct breeds of horses, each in their nature admirably adapted to the services required of them.—The carriage-horse, the hunter, the dray-horse, and the race horse, can be distinguished at a single glance. The dray-horse, in the streets of Liverpool and London, unwieldy as the elephant, with a foot of the size of a peck tub, could scarcely be conceived to be the same species as the little Shetland pony, that is seen carrying the groups of gay travellers to the top of Ben-Lomond, climbing over the rocks and up the mountains like so many squirrels. I witnessed at Ratisbon, in Bavaria, one of the finest collections of horses I ever beheld. They were owned by the Prince of Taxis, whose expensive stables were more magnificent than many of the palaces of Europe—fitted up with marble troughs—fountains for bathing—the name, country, and pedigree of each, placed in gilt letters on the wall. The number of grooms, and careful attendance, and other fooleries, reminded me of what I had read of the honors paid to the sacred Bulls of India, or the white Elephants of Ava.—Among these were horses not only from Mecklenburg, Saxony, and France, but from England and Arabia; and to me the English courser appeared not only the most elegant in form, but was admitted by better judges than myself, more active and fleet than those of Arabia itself.

In the preservation of seeds of grain and vegetables, infinitely more pains are taken to preserve the varieties distinct and unadulterated than with us. In the mountains of Scotland, there are certain districts appropriated solely to the cultivation of Garden Seeds—and no two varieties that are in danger of becoming adulterated by being placed near each other, are allowed to be cultivated in the same district. I noticed at Edinburgh, in the collection of Lawson & Son, Seedsmen and Nurserymen to the Highland and Agricultural Society of Scotland—33 varieties of Wheat, 62 of Peas, 51 of Turnips, 146 of Potatoes, and an immense number of species and varieties of Grass seeds, some of which may probably be adapted to our southern country. In a subsequent number I will endeavor to recur to this latter subject, and point out those species on which it would be advisable to make experiments.

The benefits of Societies for the promotion of agriculture, in stimulating industry and ambition, I saw exemplified in Scotland, England, and at the Fairs of Germany. The Highland Society of Scotland has existed sixty-one years, and from one of the blindest and most sterile countries of Europe, Scotland has, with all its disadvantages, risen to a state of agricultural prosperity, far beyond any thing which could have been expected from such a soil and climate; and some

of the counties, especially the Lothians, are not inferior, in point of cultivation and product, to the richest in England. At a meeting of that Society, held a few weeks previous to my arrival, 177 members were added at one time, paying three guineas entrance, and one guinea annually, and these including the names of the nobles; gentlemen in the country. At this meeting there was an additional sum of £1,500 (\$7,000) subscribed to promote the interests of the Society. Every agricultural county makes an annual report, and thus thirty-three reports, embracing every object of agricultural interest, are annually submitted to the Society.

This Society was formed in 1784, by a few gentlemen, who formed themselves in a hole and corner club, in a coffee-house called the Exchange, in Edinburgh. From a most wretched state they have raised the agriculture of Scotland, until it has reached the topmost rank. The means which were employed by this Society, are thus detailed in the Edinburgh Quarterly Journal of Agriculture:

"In the days of its youth and feebleness, the Highland Society sent the leaven of the turnip husbandry into all the glens and straits of the north, by offers of small prizes to certain Highland Parishes; and the same may be said as to the growth of clover and the finer grasses. As it advanced in strength, (as to numbers and to cash,) attention was to premiums for stock, then came offers of reward to men of science to discover better implements and machines, to diminish friction and consequently draught, such as in the thrashing mill and other parts of agricultural machinery. Still advancing in the scale of intellect and of science, premiums were offered for essays to bring to light the facts connected with chemistry and natural philosophy; and, under the auspices of the society was set up the 'Quarterly Journal of Agriculture,' a work which has been the vehicle of conveying so much useful information to the agriculturist, that we humbly venture to say it ought to appear on the table and book shelf of every farmer's parlor. After this, the great stock shows were resolved upon, as another link of union between the society and the practical farmer, at the same time throwing aside all party feeling, and making them open to stock from both sides of the Tweed, [i. e. from England as well as Scotland.]—How well they have succeeded, let the last one at Scotland bear witness. (This was the most splendid show of fine cattle ever exhibited.) Nor has the society forgotten the beauty of the country, as the premiums offered in regard to planting trees and such like subjects fully testify: and to sum up all, it may be said the Highland Society has been a *point d'appui*, a rallying point, to which the agriculturists of Scotland might look, and a fostering mother to all who, although wanting in talent, were weak in interest to make it public."

Premiums to the amount of \$17,000 were offered the last year, under the following classification:

Class I.—Agricultural machinery, 500 sovereigns and a gold and silver medal.

Class II.—Essays and report on various subjects, embracing thirty-one subjects of high interest to the farmer, viz.:

1. Geological surveys.
2. Reports on coal districts.
3. Mines and minerals.
4. Produce of peat moss, &c.
5. Comparison between different kinds of manure in raising potatoes.
6. Extended application of water and other power to farm purposes.
7. Comparative efficacy of the two modes of thorough draining.
8. Reports on irrigation.
9. Forest planting.
10. Sheep pastures at high elevations.
11. Improved sheep salve.
12. On crossing the Chevoit with the New Leicester ram.
13. Cultivation of the recently introduced cereal and other grains.
14. Feeding farm horses on raw and prepared food.
15. Early rearing and fattening of lambs.
16. Insects injurious to agricultural plants.
17. Insects injurious to forest trees.
18. Comparative nutritive property of grasses.
19. Extirpating ferns from pastures.
20. Thorough draining.
21. Subsoil ploughing of thorough-drained land.
22. Mole plough.
23. Experiments with manures.
24. Analysis of bone or rape dust.
25. On the effects of altitude on vegetation.

English Agricultural Societies, although with less uniformity, are sedulously engaged in the same cause, and the result has been the general diffusion of agricultural knowledge. The different soils have been analyzed—the kinds of manures and modes of cultivation adapted to each, have been pointed out. The steam engine has been introduced in threshing and for other agricultural purposes, and Great Britain, including Ireland and Scotland, which formerly averaged only nine bushels of wheat to the acre, last year produced in the aggregate, 19½ bushels; and three of the counties of Scotland, and several of England, averaged 51 bushels to the acre. A Farmer by the name of Thomas Oliver, residing five or six miles from Edinburgh, leased a farm for the last twenty years, of 150 acres, paying annually a rent of 10 guineas per acre, (\$7,500) on which he raised grain, hay, and vegetables for the market of Edinburgh. This lease he has recently renewed for nineteen years, (the usual time to which leases run,) on the same terms, and from a poor man he has become independent in his circumstances, and rides in his carriage. What American Farmer could make a profit that would enable him to pay such an enormous rent? All may be accounted for on the principles of judicious manuring and careful, industrious cultivation.

From a cursory review of the cultivation of the various kingdoms of Europe, it appeared to me that England was in the highest state of cultivation, and which, from its beautiful thorn hedges—its neat cottages, adorned by the eglantine, honeysuckle and ivy, checkered here and there by the park and lordly palace, rendered the whole land a picturesque garden.

In addition to a favorable climate, the soil of England has the benefit of a judicious tillage. I was particularly struck with the system almost universally adopted in regard to the rotation of crops. It should be remarked that they never cultivate two successive crops of grain on the same field. Although physiologists have not been able fully to account for the fact, that the successive cultivation of grain or vegetables exhausts the soil, whilst a change to a different product does not impoverish the land to any considerable extent, yet, it is now universally admitted, by all good husbandmen, that this is the case. Some have ascribed this to the exhaustion of the proper food of the plant in consequence of its cultivation during successive years, whilst Decandolle, Mearns, and others, have accounted for it on the doctrine that plants exude from their roots certain substances, poisonous to plants of the same variety, which in time renders the earth unfit for their cultivation. As *toujour pendritz* cloyed on the appetite of the Frenchman, so the tennin earth longs for a change of food, and withholds her fruitfulness unless she be indulged. It has often been remarked why is it that a forest which has long been covered with a growth of pine, when cut down

does not spring up again in pine, but in oak, gum, and hickory, and *cica versa*. The facts, in a majority of instances, are so. All plants spring from seed—there can be no spontaneous production. *Omnia ad ora* is a doctrine as old as the days of Linnaeus, and nature has never departed from it. May it not then be that nature, after having for ages nourished one kind of tree, has exhausted the properties of the soil adapted to that kind of production, and when a new forest is to be created, imparts its influence to trees of a different kind, better suited to its present state, and withholding its fertility from that to which it is no longer adapted. Be this as it may, the English farmer acts on the principle of the necessity of a rotation of crops. The result from this and other judicious modes of culture, has been an increase of three fold. In Carolina we have adopted the opposite course. Many fields have been planted in Indian corn since the days of the revolution, and the result has been that we have retrograded from forty bushels per acre to eight, and often less.

I will now give the method of English culture in regard to the

ROTATION OF CROPS.

1st. year. Fallow crop. Irish potatoes—beans or turnips. The potatoes, as is the case in high northern latitudes, produce small stalks, and are consequently planted much nearer in the rows than with us. Endless varieties have been produced from seed.

The beans, adapted to field culture, are the kinds usually called horse beans, (*Vicia vulgaris*.) Hundreds of acres are cultivated with this bean, and its numerous varieties, and the product is immense. It is used as food for cattle. I have never known it to thrive equally well in any part of America, probably owing to our warm summers. In our Southern states especially, the pods in general do not fill well, and I doubt whether it is calculated to be a productive crop. There is, however, one variety, from the south of France, called the Winter Bean, (*La Veccole d'Hiver*.) which is remarkably hardy and prolific. It is planted late in autumn, and stands the winters of France and England, and might be experimented on as a winter crop, when nothing else can be cultivated with us, and it would not interfere with the crop of the following spring. The Heligoland bean—Purple Field bean—and Alexandrian Field bean, are also varieties which the agriculturists of England and France recommended to me as probably well adapted to winter culture in our Southern climate.

The turnip crop is considered as the most valuable in England for feeding cattle. These different productions, however, require to be noticed under separate heads. I will endeavor to return to the subject in a future number.

2d. year. Wheat—the varieties are yearly increasing. At present the kinds cultivated almost universally in the higher grounds and lighter soils of Scotland, are the Golden Drop and Blood Red. The skins are thicker than in most other varieties, and they yield more bran. These varieties would, I think, answer well on our elevated mountainous regions.—The average crop is said to be about fifty bushels to the acre. In the Lothians—the Carse of Sterling, and in the low rich soils of England—in Denmark—and the alluvial soils of Germany, I remarked that the varieties called Uxbridge and Hunter's Wheat, were most cultivated, and considered most productive.—The yield is from fifty to sixty bushels per English acre—the average weight per bushel is from 62 to 63 lbs.—the finest 65 lbs. The Mengoswell's wheat is a variety of Hunter's and is cultivated on the Carse of Gowrie as a superior grain. Three new varieties have been very recently introduced. The Whittington wheat from the south of England—the Chevalier wheat from France—and the Hickings—the latter is white in straw, but yellow in sample. Rye is not cultivated. Grass seeds are sown in the fields in the month of April. These are red clover (*Trifolium pratense*) and Rye grass (*Lolium perenne* and *Italicum*.) Calves and sheep are allowed, in autumn and winter, to feed on the young grass.

3d. year. This is a Grass crop—usually a heavy one. It is sometimes cut twice, but usually only once a year, and serves as pasturage in the fall.

4th year. A crop of Barley or Oats is now raised. This is once more succeeded by a fallow crop. In this manner crops succeed each other by fours in good lands, or where the soils is inferior, another year is added for grass and pasturage—affording a wheat crop only once in four or five years, but producing in the mean time, other articles equally valuable to the farmer.

Electricity vs. Oak Trees.

After a philosophical investigation of some months, a writer says that species of trees are allied to iron.—

It is well known to chemists that oak contains a considerable portion of iron in its composition. It is presumed the metal is held in solution by the sap, and equally distributed throughout the tree. This may account for the fact that among a copse, the oak is invariably struck by lightning, while other trees of equal magnitude escape destruction.—On this subject a western editor says:

Our own observation confirms the fact that oaks are singled out from other trees, by electricity, and probably most of our citizens have seen its effects in this vicinity. At one place, within a few miles from this village, some twenty oak trees can be seen within the space of a few rods, splintered by the subtle agent, while other trees in the immediate vicinity remain untouched.—*Mauch Chunk Courier*.

Native Varieties of the Apple.

We entirely agree with the editor of the Magazine of Horticulture, that "many of our native varieties have not been surpassed by any foreign fruits;" and in regard to apples we are prepared to go one step further, and say that we know of no foreign variety that equals many of our native sorts. The Swaar and the Spitzenburgh may be mentioned as examples. We do not suppose, however, that these kinds, if transplanted in Europe, would yield fruit equal to what they produce here; for a slight difference of climate often works great changes in the flavor of fruits. The St. Germain, considered an excellent winter pear near Philadelphia, has been a mere incumbrance to the ground in our fruit garden; and the Rambo, the Pennoek, the Vandiver, and the Queen apple, are much inferior to those produced in that region.

We ought not to be discouraged, however, by the partial or absolute failure of a few sorts, from extending our enquiries and experiments. They cost but little: and the introduction of a superior variety, well adapted to our climate, is a public benefit. Our present success ought to stimulate us to further exertions. The Seckel pear and the Bellflower apple, attain great excellence with us, as well as in their native land, three degrees to the south.

Some persons believe, indeed, that only a few kinds of fruit are necessary; and comfort themselves with saying "We want nothing better"—just as if summer fruits would keep throughout the season; and just as if we all did not love variety. Let us go into a well furnished cellar in Winter, guided less by thought than by instinct, and the kinds that we chose to-day may be neglected to-morrow. Besides we want apples and pears for various purposes, and the best for stewing or baking, are often rejected as table fruits.

But many of our best apples decay rapidly in spring, as soon as the season becomes warm; and yet it is desirable to have such as are very good through more than half the summer. The Roxbury Russet will keep for that length of time, and is much superior to the American Pippin! but we hope and believe there is something better still.

Last winter we received grafts of more than thirty kinds of apples from Ohio, and we apprehend that but few of them are known here, several having originated in the south eastern parts of that state. Twenty kinds of this collection are growing in our nursery; but as only one small graft of each sort was furnished, we have to record that the remainder have not yet started, and probably will not. Of these, we shall hope for a new supply from our respected correspondent next winter.

☞ We would apprise our readers that these notices were written in great haste as each scion was marked and packed away: and without any idea that we should lay them before the public.

"1. *Dumpling*. Very large, cooks well when half grown—before any other, brittle, sub-acid and fine flavor. Ripe from the middle of July to the middle of August. Brought hither from Cincinnati.

• This is a good way to test their comparative excellence.

2. *Rose*. Not large, red, very sweet, excellent.—Ripe, Aug. 21, 1839.

3. *Cluster*. Middle size, brownish red, sweet, excellent. Ripe, Aug. 25.

4. *Cash*. Over middle size, sweet; bakes well; fine to dry; first rate. September.

5. *Monarch*. Large, agreeably acid; admired for the table; first rate to cook and to dry, decidedly the most valuable of its season. Ripe Sept.—Oct. A seedling of Belmont county. A noble tree—one of the largest I ever saw.

6. *Angle*. Over middle size, very sweet, and of highly agreeable flavor. Sept.—Oct. Originated near St. Clairsville.

7. *Lady Finger*. Middle size, egg-shape, sweet, first rate. Oct.—Feb.

8. *Fall Sweet*. Good size. Oct.—Dec.

9. *Locille*. Quite large, reddish brown on the sunny side, sweet; fine for apple butter, for apple molasses, and to dry. A great bearer, and a noble tree.

10. *Ohio Sweet*. Middle size, red on one side, very sweet, good flavor—the best sweet apple of its season that I know. Originated in Belmont county.

11. *Nectarfall*. Middle size, brittle, sub-acid, good flavor. [It appears to have been named from the circumstance of its coming into blossom a fortnight later than other sorts,—a property of less value to this country than in the south.]

12. *Fall Vandiver*. Good size, reddish brown, rather flat than long, unsurpassed for the table, and cooks well. Ripe, rather before other winter apples, and they fall if not gathered early. [It is also called Spitzenburgh, but doubtless very distinct from the Spitzenburghs of New York.]

13. *Pike*. Good size, sweet, one of the most pleasant I ever eat. A great bearer, but more so in alternate years. A large tree.

14. *Red Romanic*. Rather under size, sub-acid. The prince of keepers.

15. *Roman Stem*. Middle size, yellow, sub-acid, among the very best. A good bearer.

16. *Mound*. Good size, reddish brown, sub-acid; keeps till July or August; fine for the New Orleans market. Rather a spare bearer, or it would be very valuable. Originated in Belmont county, and takes its name from an orchard of them near the great mound at the mouth of Grave creek. [It may be a good bearer in this climate, however.]

16. *Red Vandiver*. Middle size, much celebrated by some. A great keeper.

18. *White Vandiver*. Middle size, valuable, keeps well.

19. *Black Vandiver*. One of the very best apples here. A great keeper. [This graft, though set on a young stock, has several apples on it, and seems to promise to mature them. 6 mo. 12.]

20. *Secret Vandiver*. Middle size, reddish brown, a choice fruit. Nov.—Feb.

Several grafts were sent at our request, that we might test the quality of the fruit; but our correspondent thinks they are inferior to those which he selected. He adds, "I am of opinion that too little sweet fruit is cultivated. It might save much sugar and molasses. Good sweet apples dried with good acid ones, and mixed, make pies of very fine quality.—Sweet apples boiled or steamed, and then pressed, yield a juice, which, when clarified and concentrated, is very superior for table use to West Indian or Orleans molasses. Hence I am taking much pains to select sweet fruit."

These remarks accord with our own views and experience. †

Do you want to know the man against whom you have the most reason to guard yourself? your looking glass will give you a very fair likeness of his face.

Child, on Beet Sugar.

We gave a brief notice of this work last month, and we now present our readers with some extracts from its pages. It is impossible for us however, without far transcending our limits, to give full directions for the manufacture of beet sugar; those who wish to engage in it, are strongly recommended to purchase the work before us. The following contains a statement of some of our author's own experiments at Northampton. The establishment erected there was on the principle of the *dessication* of the beet, a principle first successfully applied by J. Schutzenbach, a chemist residing in the Grand Duchy of Baden.

The experiment at Northampton is an attempt to carry out the principle of *dessication* by machinery, contrived by us for the purpose, Mr. Schutzenbach having declined to impart any information, unless the privilege of using his invention in the whole United States, were previously purchased and security given for the payment, in case the truth of his pretensions should be demonstrated by the results of a model factory. Therefore, in stating the results, which we have obtained, we do not implicate the system of Mr. Schutzenbach, not knowing what his apparatus or processes are, but pursuing the same principle, by ways and means of our own. We have dried the beet in a kind of small dimensions, by establishing therein a current of air, heated from 150° to 175°, and equalized by a diaphragm, pierced with holes. By this means we were able to dry 500 lbs. in 24 hours. The material having been cut into "chitters" $\frac{1}{2}$ of an inch thick by a machine, is placed above the diaphragm in boxes, having wire gauze bottoms.

For the purpose of pulverizing the dried beet, we have used, first a small cylinder set with diamond headed nails, and turning upon an inclined plane sheathed with iron; and, secondly, a coffee-mill upon the common principle.

The powder, about as fine as ground coffee, is deposited in a tub, and cold water introduced in the proportion of 3 lbs. to 1 lb. of powder. This gives a liquor nearly twice as rich as the natural juice of the beet, and just about as rich as that of the sugar-cane. This liquor contains $1\frac{1}{2}$ to $1\frac{3}{4}$ pounds sugar to the gallon.—In 20 minutes the sugar is dissolved. The whole is then thrown into sacks 8 lbs. to a sack, or so as to be $1\frac{1}{2}$ inches thick when leveled in the sack. The sacks must be made of some very closely woven fabric. Of various materials, which we have tried, twilled cotton alone has answered the purpose perfectly. The sacks are arranged alternately with osier bundles, in the same manner as those filled with green pulp in France.—One press with a hydrostatic press would be sufficient to exhaust the pulp; but having only a screw press, worked by hand, we have found it necessary to press twice, moistening the pulp between the pressions. At the second press the liquor stands at 7° to 9° by the saccharometer, instead of 10° to 12° as in the first instance.

The defecating pan contains 50 gallons, and is usually charged with 25 gallons. It is heated by steam.—The defecation is operated as in the natural juice, except that the proportion of lime is greater. The smallest which we have found sufficient, is 300 grains to a gallon of liquor. The subsequent operations are essentially the same as in the French sugar-houses. For the purpose, however, of economizing the animal black, for making and re-vivifying which our apparatus is small, we filter but twice, viz., first the defecated juice, and secondly the syrup at 20°. The concentrating pan is heated by steam, circulating, as in the defecating pan, through a series of pipes.

We have constantly obtained from 7 to 10 $\frac{1}{2}$ pounds of saccharine to 100 pounds of green beet, or to 14 lbs. of dry. The products included the molasses, which has varied from $\frac{1}{4}$ to $\frac{3}{4}$ of the whole. The unusual proportion of molasses resulting in some instances, has been owing to injury, which the beets received by frost and decay before the drying, or by smoke and burning during that process. Frost does not of itself injure the sugar of the beet, but on the contrary facilitates its extraction, and increases its purity; yet, as soon as the root begins to thaw, the destruction of its crystallizable sugar, sets in with frightful rapidity. The frozen beet when sliced is of a pure and beautiful white, but with whatever care it be dried, it becomes in the course of the operation perfectly black. This is the effect of fermentation. The effect of carbonization is still more injurious. These evils were the result of inexperience, and have been found completely susceptible of remedy. So far as crystallization took place, (and in many instances it was abundant,) the sugar has proved of ex-

cellent quality, free even in its raw state, from any bad taste, and of a pure and sparkling white when refined. Old and extensive dealers have pronounced it in both states capable of successful competition with any sugars in the market. The best result obtained from the beets of 1838, was 7 lbs. of sugar from 14 lbs. of dry beet (representing 100 lbs. of green,) and $3\frac{3}{4}$ lbs. of molasses. In this instance the beets had been dried without much injury except a degree of discoloration. The grain was strong and brilliant but the color deep. It was deemed best to leave a considerable portion of the provision of dried beet of 1838—9 untouched, until an enlargement of the apparatus should enable us to work it up with more ease and economy. The quantity of sugar which we have drained and cured, is 309 pounds. There remains in crystallizers and moulds, not cured, and some of it not sufficiently grained, 1000 lbs. more, and 2000 lbs. of molasses.

Several points of importance were settled to our satisfaction by the labors of 1838—9.

1. That all the saccharine contained in the beet can be extracted by the method of *dessication*.
2. That the raw sugar can be obtained without any bad taste, and fit for immediate consumption.
3. That American beets, though generally inferior to the European in saccharine richness, can by suitable culture be made inferior to none.
4. That 50 per cent more of crystallizable sugar can be obtained by the method of *dessication*, than has generally been obtained by grating and pressing, or macerating the green beet.
5. That the beet, once dried, may be kept an indefinite time without liability to injury.

The general result of the first season was, however, unsatisfactory. The quantity of sugar obtained, except on particular days, when the operators were upon select material, was too small; the molasses superabundant, and very bad.

The coming in of the crop of 1839, opened a new era in our enterprise. An improvement in the drying apparatus, by which the access of smoke, and better acquaintance with the management of it, by which fermentation on the one hand and carbonization on the other, were prevented, gave us nearly unexceptionable material; the liquor was light colored and transparent, the proportion of lime required less, the defecations more prompt and complete, and the concentration almost without scums. The sugar, graining in a few hours, drained well, and is not inferior in flavor or appearance to the finest West India muscovados. The quality of the molasses has been a matter of utter surprise to us. In France the molasses is considered of no value except for feeding animals, or for distilling; and it sells at 4 or 5 cents a gallon. The molasses from the sugar in question, is of a bright amber color, and so pure and pleasant, as to be preferred by many to any but sugar-baker's.

The quantity of saccharine obtained from the beets of this year, has not been so great as from those of the last year. It has in no instance exceeded $8\frac{1}{2}$ per cent, 6 of which was sugar and $2\frac{1}{2}$ molasses. We attribute the difference to the extraordinary wetness of this season.

It will be readily conceived that a small establishment dependent upon farmers for material, paying for it twice the cost of its production, and executing by hand several heavy and tedious operations, which ought to be performed by steam, water or horse-power, cannot furnish accurate data for determining the expense of making beet sugar. The actual cost, when the material was good, has been 11 cents per pound, the pulp and manure not taken into the account. We are of opinion that with proper and sufficient means, beet sugar may be manufactured in the United States, at 4 cents per pound. When the manufacture shall have become domesticated among us, it will probably be produced at a cost less than that.

We have recently made some experiments with the aid of Mr. Martial Duroy of Boston, upon beet dried by steam. The result has been a white sugar obtained at once, fully equal to the clayed sugars of Havana.

Other plants usually grown in our soil are capable of furnishing sugar, and some of them may be found worth cultivating for that and accessory products.—We have tried Indian corn stalks and the pumpkin, and have obtained from them good sugar and molasses.—Perhaps these crops may alternate advantageously with the beet. If the manufacture of sugar from the stalks of Indian corn can be reconciled, as we believe it may, with the maturity or near maturity of the ears, this source of saccharine may supersede the beet-root.—The seeds of the pumpkin yield a fine sweet oil, but we have no means of judging, what quantity of this product can be obtained from a given extent of land.—

If it should turn out satisfactorily in this respect, the pumpkin may one day overshadow the sugar-cane.

It has recently been stated in an agricultural journal* that Schutzenbach's system has been tried in France and failed. We could not credit this announcement, because we had tried the system, and were perfectly satisfied that it is capable of producing results far superior to those of any other system, which has yet been tested. The following letter from the brother of the inventor, gives timely and satisfactory information on this subject.

Philadelphia, Oct. 29, 1839.

D. LEE CHILD, Esq.

Dear Sir,—I received some days ago a letter from my brother in Germany, who writes to me the following regular results, such as they are obtained on a large scale in the beet-sugar manufactures in Polen, South Germany, Ratisbon, Weyhausen, Paris, Toulouse, &c. &c., and as I believe they will be interesting to you, I address you the present for your information.

To produce 100 lbs. of beet sugar of the quality, which is known in France by the name of *bonne quartierime*, (good brown) there is required:—

1. 1,250 to 1,300 pounds of fresh beets, such as they come from the fields.
2. 350 to 360 pounds of stone coal.
3. 100 pounds of animal charcoal.
4. $1\frac{1}{2}$ day's work.
5. Lime, acid, light, &c. &c., for 22 $\frac{1}{2}$ cents.

To this must be added the interest, the use of the buildings, utensils, &c. &c.

By this method, the cost (prix de revient) of 100 lbs. of this sugar is in Germany, owing to the high price of the raw material, fr. 9 $\frac{1}{2}$ or 10, or \$3,50 to \$4; and in the north of France fr. 18,20c, or about \$3,45, after deducting the price of the molasses.

My brother has made the following important improvements, which have completely succeeded on a small scale for the last five months. They are now brought into operation in two of the most important factories on a large scale, and will, as my brother thinks, succeed there also. By this process a quality is obtained, which will not be inferior to *white Havana*, $\frac{1}{3}$ more valued than *bonne quartierime*, and the expenses will be reduced to the following:—

- a. 1250 to 23 pounds of beets, as above.
- b. 250 to 300 pounds stone coal.
- c. 16 to 20 cents animal charcoal.
- d. One day's work, (12 hours including meal-time.)
- e. Small costs, same as above.

And, what is of the greatest importance, the stock capital, which is required for buildings, utensils, &c. of the factory, will be $\frac{1}{3}$, perhaps $\frac{2}{3}$ smaller, the manufacturing process more simple and of consequence, more certain.

I remain, Dear Sir,

Respectfully yours,

JOS. SCHUZENBACH.

It appears therefore that Schutzenbach's method is already practised on a large scale in France, turns out good brown sugar at a cost of less than 4 cents per pound; and promises to do still better than this, both as it respects price and quality. Mr. Schutzenbach's last results, as here described, are strikingly like those we obtained in working upon steam dried beet.

* New England Farmer.

From the Farmer's Cabinet.

On Rust, or Black Blight in Wheat.

Sir—As the season is fast approaching when the rust, or black blight on wheat will, in all probability, make its appearance in many parts of the country, I would call the attention of your readers to an examination of the cause of the malady, and thus enable them to provide a remedy for the future in the shape of *prevention*, which is in all cases, but more especially in this, much more easy than *cure*.

I remember, on the fourth day of last July, seeing a large field of wheat on the borders of the mill-race on the Brandywine, near Wilmington, Delaware, so completely covered with the rust as to be scarcely worth the expense of harvesting, but which was, even in that early period, in the midst of that operation—it was, indeed, a caution to behold! I understand that this wheat had been sowed on a lime and manured fallow, a cause alone sufficient, in that situation, to account for all the evil.

An excellent writer observes, "according to our understanding of the principles which regulate and determine the preparation and application of the food of plants, must be our notions of the *diseases* of plants, and our ideas of the best mode or course of cultivating them. A wide difference undoubtedly exists in the

formation, functions, and peculiar nature of *animals* and *vegetables*, but yet they may, in many respects, be assimilated; and thus, by comparison, the proper treatment of plants be simplified, and rendered more easy of explanation and comprehension. I shall take leave to state that the observations and experience of many years, have convinced me, that the opinions of the great reformer of the medical profession, Mr. Abernethy—"that the most afflicting diseases to which the human species are subjected, are generated in the stomach, and consequently are to be remedied by the stomach,"—are perfectly just and well founded; and I am also convinced that most of the diseases of animals and plants may be accounted for and remedied on the same principles. From what has been said, it is clear that vegetables cannot be supported without a due supply of food, and that with those, as with animals, the quantity and quality of food must possess an equal influence. Now, every man is aware that the *quality* of the food he consumes is equally as determined in its effects as the *quantity*, and such, no doubt, is the case with plants, as above observed; and when an animal is constrained to live on meagre, impure food, it is induced to consume a greater quantity, to make up as much as possible for the deficiency of quality, and the consequence is, a distension of the stomach and bowels; and this is often followed by a poverty and corruption of the fluids, which produce disease and debility; and the body is wasted by *eruptions*, and becomes a prey to *vermin*: and when an animal is glutted with *gross* and *rich* food, a similar is the consequence, and it is subjected to a stagnation of the fluids, inflammations and eruptions, which often end in mortification and death; and plants, under the same circumstances, are subject to the same consequences: and these observations will be found correctly to apply to and afford a clear exemplification of the rust, or black blight in wheat.

On this subject Sir J. Sinclair says, "It appears from an able paper, written by a distinguished naturalist, (Sir Joseph Banks,) that this disease is occasioned by the growth of minute parasitical fungus, or mushrooms on the leaves, stems, and glumes, or chaff of the living plants; and that the roots of the fungus, intercepting the sap intended by nature for the nutriment of the grain, render the grain lean and shrivelled, and in some cases, rob it completely of its flour; nor is this all, the straw becomes black and rotten, unfit for fodder, or little better than a *caput mortuum*, possessing neither strength or substance." And again, "several of the accidents above enumerated, may contribute to the production of rust, but there are two additional circumstances which likewise tend to promote it: first, having the land too rich a state for grain crops, and secondly when too frequent a repetition of crops of wheat takes place; and it has been well observed, that when crops intended to ripen their seed, are objects of culture, there is not only wanted a degree of vigor and luxuriance in the plants sufficient for the purpose, but if the fertility of the soil be raised to a *higher pitch* than is necessary or consistent with the object, injurious, rather than beneficial, consequences may be the result: land may be too rich for grain crops, and it is better to keep it in a well balanced condition or in a medium state of productiveness for this purpose, than in too fertile a state. The great quantity of sap and juice in vegetables growing on highly cultivated lands, it is evident, must necessarily render them more susceptible of the effects of sudden and extreme changes, and consequently, more liable to disease; besides, as mushrooms are produced on beds of dung, great quantities of manure must promote the growth of fungi or parasitical plants on the crops of wheat, if they are once infected—the wheat produced on the site of a dunghill is *always* rusted, even in the most favorable seasons, and if the whole field is a species of dunghill, how can it escape?"

A too frequent repetition of crops of wheat, more especially when accompanied by great quantities of manure to force a crop, will often have the same effect. The rust was but little known in the western or northern parts of England, or the southern counties of Scotland, until of late years, when every exertion has been made to increase the quantity of that grain in those countries."

T. A. Knight observes, "by crossing the different varieties of wheat a *new sort may be produced*, which will completely escape being rusted, although crops in the neighborhood and in almost every district in the country, may suffer for it in the same year;" and he then goes on to argue, "these circumstances tend to prove, that the *rust does not depend solely* on atmospheric influence; otherwise it could not be prevented by change of seed, or by the crossing of different varieties." Now, this theory of Mr. Knight's is

grounded on a superficial view of things, and is a mere fallacious hypothesis. Indeed, all these great naturalists appear to have bewildered themselves in specious theory; and *Go*in not having traced the operations of nature to its source, have throughout, mistaken the effect for the cause.

Now, suppose a farmer was to find a sheep unhappily reduced, and preyed upon by maggots, or the larva of the flesh-fly, he may very justly suppose that the maggots reduced the sheep, and as justly expect that whatever sheep were subjected to the maggots would be reduced in the same manner—then what would be the best and proper remedy? Knowing the maggots to be produced from eggs deposited by flies, would he try to *cover* his sheep from the flies or attempt to remove them where there were *no flies*?—Now, where is the farmer or shepherd that does not know that flesh-flies *will not* deposit their eggs on a healthy part of a sheep, or if they do, that they will not produce maggots? they know full well, that if a sheep be diseased by eruptions, or if wounded, the flies will find out those places, and there deposit their eggs; and therefore the remedy is simple—*cure and prevent the disease, or protect the wounds, and the evil is avoided—remove the cause and the effect ceases.* And very similar will be found the disease in wheat, called the rust, or black blight, and its cause. The fungus undoubtedly preys upon that which is intended to nourish and sustain the wheat, but what afforded an attraction and lodgement for the fungus? *this is the grand question.* It is stated that the fungus is a parasitical plant, like the misletoe, but this is not the fact, for the fungus has no power to attach itself to, or penetrate the *healthy stalks* of the wheat, any more than the larva of the flesh-fly have the *healthy skin of the sheep.*

Any one who will examine the stalks of wheat growing on a luxuriant, rank soil, about the time of its first showing the swelling of the ear, will perceive the vessels to become ruptured, either from the luxuriant flow of the sap upon the tender tops of the plants being checked by cold winds, or an unhealthy overfulness, or some other casual obstruction; and the sap being thus suddenly checked, will rupture the vessels, and ooze out through little slits, or longitudinal fissures; the discharged matter will soon assume the appearance of a white jelly; as it dries, it will become yellow, and then brown, and of a hard texture; and in proportion as the sap-vessels are injured and destroyed, and this exudation takes place, the plant must, of course, more or less fail in its supply of nourishment for the grain. In some cases, the strongest stalks will not be able to push the ear beyond the leaf, and the corn consequently, will be starved; and whilst the season continues dry and cold, the exuded sap will remain like dry gum; but as it advances, and the weather becomes warm and moist, the gum becomes moist, soft, and putrefying, and then it forms and affords a nutritive bed for the mold or fungus, which grows and increases until it is deprived of moisture, or is so reduced as to be insufficient to sustain it, when it dries; and according as the season is favorable or unfavorable to its growth, it produces a brown or black powdery substance, in a proportional quality. Thus then, the *foundation or cause of the rust of fungus, is the putrefying matter discharged from the ruptured sap vessels of the plant*; and although the ruptures may be occasioned by a contraction or obstruction of the vessels by atmospheric influence; the overfulness or over-luxuriance of the plant produced by surfeit; or the being glutted with rank and unwholesome food, and its incapacity of digestion, and unhealthy obstructions render it more liable to such injuries; and may therefore be considered as the general cause of the disease, blight or rust.

I have planted wheat on a rank compost of dung, which from its first appearance in the autumn, during its growth in the winter and in the spring, maintained excessive luxuriance, but which was ultimately so reduced by rust as to be rendered weak, and incapable of bringing its seed to perfection. At the same time, and close alongside, I also planted wheat in a pure and sweet sand, and supplied it with a solution or infusion of rotten dung by way of food; this never appeared half so luxuriant as the other, but the stalks of straw grew perfectly healthy, and free from disease, and the grain was of good quality.

I would urge upon your numerous readers a serious consideration of the above remarks: they are upon a subject little understood, but which deserves the examination of every agriculturist throughout the Union. The great diversity of opinion on this subject of blight, must have arisen from the fact that the *effect* has been mistaken for the *cause*, and whilst that error continues, there will be plenty of crop of rusted wheat. Will

our friends *look out for them*, as the almanac says, *now about.*

JACOB LEST.

From the Maine Farmer.

Importance of Agricultural Experiments.

MR. HOLMES:—A spirit of agricultural improvement is abroad in our country, and the subject is beginning to excite the attention of government. An abundance has been said, and justly too, in praise of agriculture. Other branches of industry are indeed necessary in order to advance the great interests of the country, but it is truth incontrovertible, that agriculture lies at the bottom of every other interest. Agriculture furnishes the means of increasing or extending every other branch of national industry, also the means of prosecuting every kind of public improvements; some political economists have attempted to prove that commerce is superior to agriculture in point of utility, and some writers have placed the mechanic before the farmer, but the arguments of both crumble at the touch of truth. The farmer and the mechanic are creators of the materials from which the merchant derives his wealth, and the mechanic, what is he if the farmer refuses his aid? A skillful mechanic (especially one who manufactures superior implements of husbandry) is a public benefactor; but of what avail is the most consummate skill, if the farmer neither purchases nor consumes? Agriculture furnishes a healthful and profitable employment to three-fourths of our population. No employment conduces in so high a degree to preserve the moral health of the community. Where can rational liberty find a safer asylum than in a country where the great body of the people are actively engaged in agricultural industry and in agricultural improvements? Every branch of industry, except agriculture, is liable to be overdone, and when this happens, distress more or less severe is sure to follow.—This country is now groaning under the effects of excessive foreign trade. Who ever heard of a national distress occasioned by a spirited agriculture? If the merchants who imported silks and other gewgaws from Europe, and by so doing involved our people in debt, had been skillful industrious farmers, who will pretend that the country would have suffered as it now does? Science is indispensable in order to the success of agriculture, but experiment is the great lever of improvement. The business of science or theory is to reason on facts: who can be a good farmer without reasoning? The business of experiment is to test the truth of theory, and thereby come at certain knowledge. Every farmer who tries experiments in agriculture for the public good, deserves the gratitude of the whole country. But individual efforts are insufficient, there must be union of efforts in order to meet with great success. Suppose that 100 farmers in different parts of this State can be found, who would be willing to appropriate each one half acre of land for the purpose of trying some experiment in the culture of wheat. Suppose these 100 farmers can act in concert, and each agree to try some different experiment, and continue their efforts we will say for 5 years, varying the mode of experiment each year, only think! five hundred different experiments skillfully conducted: who can tell what such a course of management may accomplish? But if 100 farmers acting untriedly can accomplish so much or try so many experiments without imposing a heavy burden upon any individual of the association, what may not the whole State accomplish for every branch of agriculture, if backed by the energies of government. That government which produces the largest amount of human happiness is certainly the best, whatever may be its style or the name by which it is known. Human happiness should certainly be the object of every good government. In this country more than any other, we expect the measures of government to be such that the happiness of the people be directly promoted. Every person in the community is directly or indirectly benefited by an improved agriculture: and if we have any regard for the democracy of numbers, certainly the agricultural interest should be always in the front rank. An active government in a country possessing such facilities as the State of Maine, can not fail to cause to be made agricultural improvements of a very high order. However the case may be with a sluggish government, some indeed may be found in our State, who think that the government should do nothing to push forward agricultural improvements; but whether such opinions arise from "constitutional scruples," or whether it is thought to be bad policy, in which the State should not engage, I am not able to determine. I think that sound policy and justice require that the government give a spirited support to the agricultural interest:—Let the united voice of our yeomanry from one extremity of the State to the other be, We demand it of you.

JOHN E. ROLFE.

Culture of Fruit.

Among the best varieties of the pear which have been proved in Western New York are the following:—The *Little Musk*, (or *Primitive*,) ripens at early wheat harvest, it is small, yellow, with red next the sun, of a pleasant, but not high flavor. The tree is of vigorous growth and is an abundant bearer. Its early maturity renders it well worthy of cultivation. The *Madeleine*, (sometimes called *the earliest pear*.) is the earliest first rate fruit which ripens. It follows immediately the preceding. It is of about medium size, green, with a slight tinge of yellow when ripe, flesh white, with a slightly acid and very agreeable flavor. The tree is very rapid in growth. The early *Rousselet* ripens about two weeks later—rather small in size, russetty brown, like the *Seckel*, which it somewhat resembles in flavor, though greatly inferior. Except with good cultivation, and eaten ripe from the tree, it is hardly a first rate fruit. Nearly the same time the *Skinless* ripens, which though not very high-flavored, is one of our best early pears. It is rather small, very smooth and thin skinned, with a juicy and sweet flesh and is a very abundant bearer. The *Jargonelle* is rather large, with a slightly acid and excellent flavor, and though ripening later than the *Madeleine*, may be classed with it in excellence. The *September* is one of our best autumn pears, possessing a sweet and remarkably agreeable flavor. The fruit has been somewhat subject to mildew, but in every instance we have seen, it appears to have resulted from neglected cultivation. The *Seckel* is well known to cultivators of fine fruit, and for richness and delicacy of flavor, stands unrivalled among American pears. The tree is small, and the fruit small and uninviting in appearance, as commonly cultivated. To obtain the fruit large, and in perfection, the ground should be rich, and the tree pruned to a more open head than usual. The *Virgalieu*, (known also by the names of the *Butter pear*, *St. Michael*, and a dozen others,) is one of the very best of our late fall pears, and is well known among cultivators. It appears, in Western New York, to have lost none of its original excellence, though the variety is said to have "run out" in some parts of New England. The *Napoleon*, one of the new Flemish pears, promises to be one of our best autumn pears, being not inferior to the *Virgalieu*.

Robert Manning, of Salem, Mass., who has given more attention to the culture and proving of fruit, especially of pears, than any other man in America, says the *Amire Joannet* ripens about ten days before the *Little Musk*, to which it is superior in size and flavor. It consequently deserves general cultivation. He also mentions the following, among those he has proved, as fruits of uncommon excellence:—*Williams' Bon Chretien*, *Dearborn's Scedling*, *Andrews' Belle Lucrative*, *Surpass Virgalieu*, *Petre*, *Urbaniste*, *Marie Louise*, *Passu Colmar*, (early winter,) *Eastern Beurre*, (late winter), and others.

Among the best *peaches*, and which also afford a succession from harvest till frost, are, *Early White Nutmeg*, which is a very small peach, and cultivated only on account of its early ripening: *Early Ann*, a little later, much larger, and far superior; *Tillotson's Early*, a very early variety of the Red Rarripe, *Early York*, *Noblesse*, *White Imperial*, (new seedling) *White Rarripe*, *Red Check Malocoin*, *Royal Kensington*, *Yellow Alberge*, *Malta*, *President*, *Lemon* (or *Kennedy's*) *Cling*, *Old Norwington Cling*, *Old Miron* do., and late *Heath*. The latter, to ripen well and attain perfection, should be in a warm situation, and the fruit, while small, should be thinned on the branches to six inches asunder. Without the former the fruit may not ripen before early frost; and without the latter it may be small and without flavor, but with it we have seen trees bearing fruit averaging from

two and a half to three inches in diameter. If taken in before frost, they will keep till winter.

(To be Continued.)

Tuscany Wheat.

MESRS. THOMAS & BATHAM—According to your request, I send you an account of the Tuscany wheat which I have raised the three years past, and some of which was sold in your city last fall.

In the fall of 1837, Mr. Abram Hanford, of Scottsville, gave me 7 lbs. of seed wheat, which he bought in New York, from a vessel that had just arrived from the Mediterranean with a cargo of wheat, and had a small parcel of this kind on board. I sowed it on the 18th of September, 1837, on a clay soil, after corn, once ploughed and well harrowed. On the 10th of June following it headed out, and on the 16th of July I harvested it, and thrashed out 207 lbs. of uncommon fine large wheat. In harvesting I perceived that there were four varieties in small quantities, and I was careful to separate them; and the next fall I sowed each kind by itself. In the spring following I found that two of the varieties would not stand the winter, but were mostly killed, so I did not preserve them. The other two, one a bearded and the other a bald variety, stood the winter well. The bald was much the larger quantity, and this I sowed on a very bad fallow; the soil a stiff clay, broke up very late, leaving it in hard lumps. This was the only piece of land I had which was not in the immediate vicinity of some other wheat; and I wished to keep it quite separate: besides I did not mean to give this my better chance than other wheat. But at harvest I found I had lost considerable by not showing this kind more favor. On thrashing I had 40 bushels of fine large wheat.

I sowed ten acres of this wheat the middle of September last, and on the 28th of May it was all headed out. The crop now looks finely, (although sown rather too thin,) and I have no doubt will be fit to harvest by the last of June. It stands our winters well, and is considerably earlier than the common wheat, which is a great advantage to our farmers as it will be less liable to injury from rust. Its growth is much larger and stronger than other wheat, and the berry is very large and of fine quality. I will send some of it to the Rochester Seed Store when thrashed, and I have no doubt that all who examine it will pronounce it superior to any other wheat in the country.

Respectfully Yours,

W. T. CUYLER.

Woodlands, near Moscow, June, 1840.

A Protective Tariff.

MESRS. EDITORS—I see that some of the correspondents of the New Genesee Farmer advocate a high tariff on foreign fabrics, in order to encourage home manufactures, and create that market for the products of our own agriculture which cannot be found abroad.

Hezekiah Miles, the great champion of a protective tariff, is dead, but the good he did to our cotton manufactures lives after him. He was in favor of free trade with all nations, so far as they would receive our raw material and bread stuffs in payment for their manufactures and staples, but no further. Had this nation adopted his rule, instead of running in debt \$200,000,000 to foreign nations, we should have escaped both panic and revulsion, with the consequent appalling deterioration in morals which they have engendered.

As long ago as the first embargo, in reply to the complaints of New England in Congress of the ruinous effect of that measure on her commerce, the language of the South was, "go to manufacturing."—New England did manufacture, the non-intercourse gave her protection, and the war which succeeded,

with its double duties, gave the manufacturers enormous profits. But peace took place, the double duty came off, and foreign competition was about to ruin the young manufacturer, when the generous South consented to the tariff of 1816. Even Mr. Calhoun tells us that "he at that time had the simplicity to consent to a tariff of protection."

But it is too much the custom of our northern farmers to deery and undervalue the southern planter; 'tis true the people of the slave states are great sinners, but we read that those were not the greatest sinners "on whom the tower fell."

Without the cotton of the South, our country would make but a slim figure in the mercantile world. 'Tis doubtful whether we should have had a single rail road or Atlantic steamship to this day, if the South had made no cotton. New England is shrewd enough to understand her interest—the South is her great customer—it is the only goose she has which lays a golden egg.

The South is very sensitive on the subject of tariff: we can only hope that her present poverty and great embarrassments will make her of a better mind, and open her eyes to the best interests of the nation. Mr. Calhoun has long made free trade his hobby, and never man had a hobby who was better able to defend it. His inventive genius and graphic mind can always make the "wrong appear the better reason."

The probable continuance of low prices for all the necessaries of life, must give a great spur to manufacturing enterprise. This will be quite as legitimate, and less hazardous than a highly protective tariff, with high prices, induced by an inflated, unstable currency. S. W.

Seneca co., June 7th, 1840.

For the New Genesee Farmer.

A Durable Cider Press.

MESRS. EDITORS—

Having occasion to repair the Cider Mill in 1835. I found the press which had been constructed in the old fashion, very much out of repair. The posts, though under cover, would rarely stand more than two seasons; I concluded to put up two presses with iron screws. The new press I made after my own fashion, and though much laughed at while constructing it, because of its novelty, I have had the pleasure of seeing it overcome all opposition, and become a decided favorite.

The bed pieces, and beam, are according to your fancy as to size. The beam should be a very heavy one, else it may spring. The beam is framed to the centre sill by two 4 inch hard-wood scantling at each end, as near the outside as possible. In the centre is another piece of scantling at each end 3 by 4 to serve as a guide for the follower. I then took two bars of iron, an inch and a quarter square, for each end. Upon the upper end I made heads, and fastened the lower one with a key. A plate of iron was put upon each end to prevent the rods from drawing into the wood. These rods were put through the beam and sill on each side of the centre scantling, and as near the posts as possible. They kept the frame together when making the press. The posts kept the beam up, and protected the rods. The screws were of iron, and were worked with a bar about seven feet long. This press was in operation five years, and never cost one cent for repairs. It was taken down the winter past, and every part as sound and as good as when first put up, except the sills—and they would have stood some years yet.

If any of your readers should have occasion for a new press, I think they will find this much the most durable, and the cheapest.

Respectfully yours,

Darien, June 17: 1840. T. C. PETERS.

Heaves in Horses.

MESSESS. EDITORS—A correspondent of yours wishes to know of a cure for the heaves in horses. I have heard a medicine recommended as an effectual cure; but I think, that, like the asthma in mankind, it cannot be wholly cured. This, however, is the most effectual of any thing I am acquainted with.—Take a small portion of slacked lime, say a handful; throw it into a pail of water, and give this to him as long as you perceive any signs of the heaves, which will generally be two or three days. This is very simple, and within the reach of every one.

Yours, &c.,

Greece, June 14, 1840.

HOSTLER.

Hoof Ail, or Foot Rot.

MESSESS. EDITORS—In perusing an old English agricultural work a short time since, I noticed the following highly approved cure for the hoof ail, or foot rot:—

“Bleed copiously. If the disease first appears between the claws, wash the part clean; when dry, rub a tar rope to and fro between the claws till an evident warmth is produced; then dress the part with a wooden skewer dipped in butter of antimony, oil of vitriol, or nitrous acid. Let them stand dry for an hour or two, and then turn them on a dry pasture. Repeat this for three or four days successively.

“If inflammation appears, reduce it by a poultice of linseed meal, or rye flour. The cure will be accelerated by administering the following saline purgative:

“Take of glauber salts, one pound; ginger, powdered, two ounces; molasses, four ounces; add two pints of boiling water, and when of new milk warmth, give at one dose. Particular care is requisite to keep the animals on dry pasture for a week or two.”

Knowing that this disease is considered by many farmers in this section as incurable, I think the recipe may be of timely aid.

W. N. H.

Yates Co., June 15th, 1840.

From the Yankee Farmer.

Experiment in Sub-Soil Ploughing.

On Monday last we had the pleasure of witnessing an experiment at sub-soil ploughing, with Smith's plough, lately introduced from Scotland, at an expense of \$75, by Messrs. Ellis & Bosson. This experiment was made upon the farm of John Fenno, Esq., in Chelsea, and we believe it is the first attempt of the kind in this country; it was very satisfactory and gave evidence that our soils may be deepened with convenience, and at a moderate expense, compared with the great and permanent utility that will result from such operation.

The spot selected for trial was not favorable to an easy operation, as the sub-soil was very stony, but the plough worked well, going to the beam where the soil was free from obstructions; the small stones were thrown up, as the plough is constructed with a view of producing this effect, and some stones weighing several hundred pounds, that were completely buried in the earth, were thrown up so that they might be easily removed.

In our two last numbers we published an interesting article on “Thorough Draining and Sub-soil Ploughing” by the inventor of this valuable system, and to that we refer the reader for particulars as to this method of ploughing and its great advantages.

The plough used in the experiment, though not of the largest size, possesses great strength, being made wholly of wrought iron and weighing about 300 pounds. The whole length of beams and handles is fifteen feet, its depth from the bottom of the beam is 19 inches, so that it will run 16 or 18 inches deep. It has no mould board, and but a narrow wing, as it is intended for loosening the sub-soil, without displacing it or mixing it with the active soil. A spur rising obliquely from the wing, runs about midway the furrow and thoroughly loosens the soil and throws up the small stones.—After sub-soiling the ploughing is gradually deepened at every succeeding operation, and portions of the surface soil become enriched by manure and exposure to the atmosphere.

There are many tracts of rich, but at present, wet and useless lands, that may be made the most productive in the country, by under draining, and sub-soil ploughing, as described in the article which we have referred above.

Besides the great advantage of sub-soiling in re-

claiming wet lands, it will greatly improve light soils; it will deepen the active soil which will be of immense advantage in root culture, and prove beneficial to most all crops; for there is hardly any plant cultivated, the roots of which would not penetrate below the usual depth we commonly plough, if a fine mellow soil was prepared for them; and where there is much depth there is less injury from drought, for in thorough cultivation the loose soil at the surface prevents the evaporation of moisture from below, where the roots of plants freely penetrate and find nutriment.

As the sub-soil ploughing and its advantages become known in this country, it will be practised where land is dear, as it will greatly increase its capacity for production, and farmers generally who are able to expend something for improvement in this way, will find from the capital thus invested a good and permanent profit. The profit from sub-soiling is like that from clearing a piece of land from stones and putting into wall; it is at first attended with considerable expense, but it produces a lasting benefit. It is in fact only carrying the same principle to a greater depth.

Mr. Fenno, and Mr. Worcester of the Cary farm, are entitled to credit for their generosity in the cause of agriculture in furnishing teams and aid in this experiment, also Capt. Perkins who managed the plough in this new method, with as much skill we presume, as a Scotch veteran when sub-soiling was first introduced. Mr. Fenno's hospitality will be remembered by those who “never forget the time of eating and drinking.”

Agricultural Papers and Warehouses.

The Maine Farmer of the 18th April, publishes a communication, designed to prejudice the public against those agricultural journals which are published or having any sort of connexion with an agricultural warehouse or seed store. We are sorry that that good paper should thus array itself in solemn warring against the “New England Farmer,” published in Boston by Joseph Brock & Co., who keep a large agricultural warehouse and seed store, and also against the “Yankee Farmer,” of Boston—formerly of Portland—which is published in connexion with Ellis & Bosson's extensive warehouse and seed store. We take but very little offence to ourselves, because we are conscious of not deserving so much of it as do these papers.

The writer protests against the encouragement of papers which are edited by persons who are not acquainted with the business of practical agriculture, and who “prostrate their talents for hire.” As if men ought to labor for nothing in order to be respected or beloved! There's for you Dr. Hohness of the Maine Farmer—there's for you also, Rev. H. Colman, the unpractical, “hired” editor of the New England Farmer—there's for you, also, Mr. Cole, editor of the Yankee Farmer—there, too, is for you, Gov. Hill of the Concord Visitor, and even ourselves, perhaps, will have to fall in the rear of this honorable company who are thus to be swept by the board.

Now we do not think that our farmers are such fools as to be deceived by an advertisement that appears in any paper, or that they are running any more risk in purchasing a plough, hoe, rake or seed of men who are engaged in publishing agricultural newspapers, than of persons who take less interest in the subject. We therefore cannot join in the admonition which the Maine Farmer's correspondent deals out to the public, to beware of the N. E. Farmer, the Yankee Farmer, and even we might add the Maine Farmer, whose editor cannot escape the censure, which the general principles laid down in that communication would concentrate upon him as much as upon the rest of us.—*Maine Cultivator.*

Remarks by the Editor of the Yankee Farmer.—We noticed the ridiculous article above alluded to, and it reminded us of the old lady, who on hearing it observed that a certain minister was so very illiterate that he could scarcely read, gravely exclaimed, “So much the better, for he has no human learning to depend on.” It is late in the day to hold up the doctrine, that the more ignorance the more honesty; such stuff will not be swallowed by an enlightened community without some remuneration.

Every intelligent farmer knows very well that an important qualification for an editor of an agricultural paper is a good knowledge of agricultural mechanics; and how can this information be obtained without a familiar acquaintance with agricultural warehouses, where may be examined the various implements and machines in use, and by testing such things, witnessing their practical operation and comparing their several advantages in order to judge of their utility?

We are aware that the editor who is more retired while laboring under a disadvantage in this respect,

and liable to pull an inferior article, has his advantages also from his situation, and it is a narrow policy that would array papers against each other on account of their local advantages, or on account of their situation, affording greater or less facilities for the publishers and editors to play off deception.

The editor of a paper not connected with a seed and implement store, may advertise or puff a worthless article, and thus honestly aid in gulling the farmers, when a peep into a depository of machines and implements would at once show the error into which he has unintentionally fallen.

We wish that the writer who warns farmers against taking papers connected with agricultural establishments, lest the editor deceive them by commending articles which the publishers sell, would examine papers differently situated, and see the implements and machines figured and recommended in them; and then step into the agricultural warehouses and see such articles neglected and rusting, while better ones are advertised by the publishers and recommended by the editors which he censures so liberally.

As a striking instance of the deception to which farmers are liable, we lately noticed in an agricultural paper published in the interior, the representation of a thing called “Smith's Sub-soil Plough improved.”—At that time Smith's plough had not been used in this country in order to learn whether it was susceptible of improvement, and until very recently it had not been introduced into this country, and that thing, which seemed like an attempt at caricature, must have been an entire invention by some one who had never seen Smith's plough, nor had dreamed of any thing that resembled it.

Let each agricultural editor avail himself of the advantages his situation affords, of collecting and disseminating useful information, and in this way the whole editorial corps are mutually benefited, and the information of all may be spread before the readers of each journal; and above all, let brotherly love prevail, and let us suffer none to stir up strife among us.

Let us show to editors of political papers, and also to those who conduct religious journals, that it is not our principle business to dwell on our differences in opinion, but to promote the great and good object in which we profess to be engaged. Let us be to them a pattern, for surely something of the kind is wanted. Let us exhibit towards each other in practise those many cheering qualities which they profess.—*Yankee Farmer.*

Instructions to Young Mowers.

Every farmer who has employed many mowers, has had occasion to pity the manner in which some of them “dragged their slow swartwits along,” while he was delighted with the ease, the rapidity and smoothness with which others, of far less strength, would pass over the field.

The instructions of a kind and indulgent father on this subject are not only fresh in my memory, but have made first rate mowers of many young men, and perhaps may be useful to some of those who may mow for the first time hereafter. I say for the first time, because very few change a bad habit (of mowing particularly) after it is once acquired. “As the twig is bent, the tree is inclined;” so with those who use the scythe. Therefore let the boy of fourteen mow one or two hours in each day, during the haying season for two or three years, when, by the following directions, he may be able to successfully compete with the strong but illy instructed. Let his snath and scythe be very light, and the scythe of razor like edge, and so hung, that when suspended on the finger by the lower knob, the point and heel of the scythe may be at equal distances from the ground. When at the edge of the grass let an old and good mower, (who is to walk near him half an hour,) instruct him to stand nearly erect, the hips being further advanced than the shoulders, and under no circumstances to stoop, and when inserting his scythe into the grass be sure to keep the heel high the ground; and when cutting the clips and after, let the point be equally near it: let the body turn with the scythe as on a pivot, the heel of the scythe passing within two or three inches of the advanced foot. This will relieve the arms, and so divide the effort, that he will mow with as little fatigue as he can perform light work, and soon laugh at the “six footer” who stoops to reach his grass.

Let the boy also at first be instructed to clip only ten or twelve inches of grass, until his erect posture and the horizontal position of his scythe become habitual, when his love of ease, his interest, and desire to triumph, will require a long scythe, perfect in temper, yet light, and from heel to point the segment of a circle of about seven feet radii.—*Farmer's Monthly Visitor.* J. W. W.

Brief Hints for the Month.

The chief business of spring, as every farmer knows, is to get the seed of his crops into the ground. But many do not appear to understand the importance of taking care of those crops afterwards. It would be as absurd to suppose that a crop could be had without planting, as that a good one could be obtained without any subsequent labor.

A herd of cattle breaking into a corn field and destroying a quarter of the crop, is a grievous misfortune; but an army of weeds in full possession, destroying three quarters, is patiently endured.

The farmer spends a month of weary labor, in ploughing his field, harrowing, manuring, ridging, and planting; and then loses the avails of most of his labor by omitting a thorough expulsion of these silent but voracious intruders. It is as great a cost of land and manure, to raise a weed as to raise a useful plant. Let not the farmer therefore expend his resources for the production of the former.

Many who have clean corn fields, neglect their pastures. Mullins and field-thistles often over-run them. They may be extirpated with little cost and great profit; and when once the land is cleared of them they are kept out with little labor.

Canada thistles, St. John's wort, and other weeds of this class, may be destroyed by deep ploughing, as directed last month.

Grass for hay, beaten down by rain, should be cut early, before it becomes mouldy, decayed, and unpalatable. But other grass should stand until the seed approach maturity, as the hay will then be sweeter, more tender, more nutritious, and be more easily dried.

Clover hay should be but slightly dried in the sun, and the remainder of the curing performed by putting it up in small cocks, so that it may heat very slightly, to be turned when necessary. Exposure to dew, so injurious to clover hay, is thus avoided; and the thin leaves and succulent stem become equally dried together. The labor of spreading is also saved.

Every farmer should have a horse rake, and as soon think of being without a plough, as without one. The horse rake possesses nearly the same advantages over the hand rake, as the plough over the hoe in breaking up a field.

Let all farm implements, when not in actual use, be kept from sun and rain. The sun cracks the wood and the rain soaks and rots it, and they last not one quarter the time that good care would insure. Some farmers thus pay fifty dollars a year, needlessly, in the purchase and repair of wagons, carts, ploughs, harrows, hoes, spades, cultivators, &c., &c.

The Turnip Fly.

The following remarks, copied from the old and celebrated work on drill-husbandry, by Jethro Tull, contain some excellent hints, and may be of value to those at this season, who are about to sow crops of turnips.

"When I sowed turnips by hand, and hoed them with a hand-hoe, the expense was great, and the operation not half performed, by the deceitfulness of the hoers, who left half the land unhoed, and covered it with earth from the part they did hoe, and then the grass and weeds grew the faster.

"When I drilled upon the level, at three feet intervals, a trial was made between those turnips and a field of the next neighbor's, sown at the same time, whereof the hand-hoeing cost ten shillings per acre, and had not quite half the crop of the drilled, both being measured by the bushel, on purpose to find the difference.

"In the new method they are more certain to come up quickly; because in every row half the seed is planted about four inches deep, and the other half is planted exactly over that, at the depth of half an inch, falling in after the earth has covered the first half.—Thus planted, let the weather be never so dry, the deepest seed will come up; but if it raineth, the shallow will come up first: we also make it come up at

four times, by mixing our seed, half new and half old, (the new coming up a day quicker than the old;) these four coming up give it so many chances for escaping the fly, it being often seen that the seed sown over night will be destroyed by the fly, when that sown the next morning will escape; and *vice versa*; or you may hoe plough them when you see the fly is like to destroy them; this will bury the greatest part of them; or you may drill in another row, without new-ploughing the land.

"This method has also another advantage of escaping the fly, the most certain of any other, and infallible, if the land be made fine as it ought to be: this is to roll it with a heavy roller across the ridges, after it is drilled, and closing up the cavities of the earth, prevents the fly's entrance and exit, to lay the eggs, hatch or bring forth the young ones to prey upon the turnips, which they might entirely devour if the fly came before they eat more than the two first leaves, which being formed of the very seed itself, are very sweet; but the next leaves are rough and bitter, which the fly does not love."

The author remarks that he has seen drilled turnip seed, when put in at different depths, as above stated, "come up daily for a fortnight together;" and that he has had the first that came up all destroyed by the fly, "and about a fortnight after more have come up and been hoed time enough, and made a good crop."

Rolling, without doubt, is one of the most efficacious modes, perhaps the most so, to prevent the attacks of the fly; but where the soil is in any degree of an adhesive nature, caution is needed that it be not done when the ground is too wet, or it will become too much packed and hardened; though the subsequent passing of the cultivator between the drills, would lessen the evil by rendering it mellow.

The preceding remarks, our readers will doubtless understand, were intended to apply to the flat and globe turnips, and not to the ruta baga. Some advantageous hints, however, in the culture of the latter might be derived from them.

Lightning Rods.

While some important requisites are neglected in the construction of lightning rods, much pains are taken with what is entirely unnecessary. Among unnecessary particulars, we may mention the practice of employing glass supports to connect it with the building. Well painted wood is much better and cheaper. Glass, when wet, as it always is in a storm, conducts as well as wood. Wood is much stronger, and by it the rod may be held at a greater distance from the building. If the rod is *continuous throughout*, and penetrates the ground far enough, the electric fluid in all cases, must go directly to the earth, without passing in any other course. It chooses the most direct channel and the best conductor. Hence a heavily charged jar, may be discharged by a rod held in the naked hand, without the latter being affected in the slightest degree. But the hand is a much better conductor than dry, painted wood.

Among important requisites neglected, is sufficient height. A rod will safely protect a surface whose diameter is four times the height of the rod above it.—Thus, a rod placed in the middle of a building, forty-eight feet long, should rise twelve feet above it.

"The rod should enter the earth at least five feet and terminate in a bed of charcoal, which is a good conductor. The best and most convenient way is to dig a trench five or six feet deep, extending a few feet from the building, and place in the bottom a few bushels of charcoal."

If the point at the upper extremity of the rod be always sharp: if the rod be *continuous throughout*, by being *scattered* and not merely *linked* together; and if it terminate at some feet below the surface, so as always to be in moist earth; it will discharge an electrified cloud *silently*, and without explosion, in the same way that a pointed wire discharges silently an electric battery.

Paint preserves a lightning rod from rust, and does not diminish in the least its conducting power.

Electricity vs. Oak Trees.

We make a remark which should have been appended to the extract with the above heading, in another column. We do not doubt that oak trees may be struck more frequently than other trees. Whether it be owing to their situation on hill tops, to their greater height, or to their better conducting power, we cannot positively assert. That the oak contains iron, is quite new to us; and if that be actually the case, it could not much, if any, increase its conducting power. Unless it were in an uncombined metallic state, which none we presume will assert, its conducting power would be very imperfect. Its oxide are non-conductors, and its salts are imperfect conductors; and the small quantity of either could not have much effect on the conducting power of the tree.

The Flowers of Summer.

At the commencement of summer, the *Braeted or Caucasian poppy* is unquestionably the most showy plant in the garden. Ten stalks from one root, nearly four feet high, bearing flowers of the brightest crimson which may be spread from six to eight inches wide,—is no common object. It is perennial. Another perennial species of the genus *Papaver* is very brilliant, but a little later in coming into bloom. This is the *Oriental Poppy* with flowers of a bright orange color,—less in size and less in height, but very ornamental.

We like those Roses best that are not much disposed to fill the ground with suckers; and such as may be distinguished afar off—not requiring a close inspection to find out how they differ from their associates. The following sorts possess those properties:

The *Harrison* is the earliest double rose in our borders, of a light yellow, and continues long in bloom.—It is tall, and may be a *hybrid* from the single yellow or the sweet brier, as the leaves are slightly scented. If we were to cultivate but three roses this should be one.

The (single) *red and yellow Austrian* is not to be mistaken for any other kind; and comes nearer to a scarlet than any rose that we have seen. It is much admired.

The *Caroline rose* is the most graceful in our possession; somewhat globular, and rarely displaying its centre. The flowers of a pale red, are numerous; but stand apart on its long slender stems. It is quite hardy here, though the seedling of a China rose; and came to us only second-hand from her who raised it, and in honor of whom it was named.

The *Champney* another offspring of the China rose, though less hardy than the former, has done well in the open border. Under the snow it is safe, and our coldest weather generally comes when it is covered; but if its stems should be damaged, it sends up new stalks with great vigor, which soon come into bloom. Like others of the same species, it flowers all summer and through most of autumn.

A *tea rose*, light blush, and of the most delicate fragrance, abides the winter without injury in a covered border,—as well as the *Greville rose*, the *multiflora*, and several others of this tender class.

The *double sweet brier* (so called) with petals a little marbled, is a fine rose. The *moss rose* is always admired. The *Belle Alliance* marked with white streaks, is unique. The *tall blush*, the *hardy red monthly*, the *cabbage rose*, the *double white*, the *Labrador*, the *royal Provence*, the *single yellow*, the *maiden's blush*, and several others of uncertain name, are also good plants for the border, and add greatly to its beauty and variety.

There are many other kinds in request, however, such as the *burning coal*, the *black Tuscan*, the *burnet-leaved*, &c. &c. &c. besides the *Scotch roses*, which

so beautiful; but on account of their spreading rough the soil, are unsuited to borders with box plantings.

Few plants make a finer display than the *Fraxinella* with its striped flowers of red and white. No pleasure arden should be without so fine an ornament.

Campanula grandiflora has very large flowers of a deep blue-purple. *C. persicifolia* with its erect stem, polished leaves, and pure white flowers, is eminently beautiful. The blue variety is also fine; and some double and some single flowers of different species of this genus, are very showy.

Several kinds of *perennial larkspurs* make a fine display. The *Siberian bee larkspur*, and one or two others, send up from the roots so many stalks that when added they form columns seven or eight feet in height, encased with blue flowers. These species, like most cultivated plants, have seedlings which vary in form and color, some much finer than others. The Chinese larkspur, single and double, is also very ornamental; and another perennial species which came without a name, is so double that it yields no seeds.— Its color is the richest blue purple.

Clematis viticella is a climbing shrub with deep purple flowers presented on long peduncles. It has a light and elegant appearance.

Gladiolus communis (common sword lily) is one of the prettiest plants in the garden. The flowers, on stems three feet high, all face one way, and are generally of a fine red; but a new variety has sprung up in our borders of a flesh color. We have also had them white, but these have not done well, and probably belong to a different species.

The *purple fringe tree* is a wonder. Soon after all its small flowers unfold, the fringe begins to protrude from the peduncles; in a short time it absorbs all the nourishment, and the bloom perishes. The fringe then increases till the branches become loaded, and the leaves partially concealed. A little girl who knew its name, called it "the wool tree."

The *white fringe tree* is a very different plant, but so beautiful. Its fringe consists of long slender petals which almost hide the leaves. It grows indigenously in the south-eastern parts of Pennsylvania, but the former is a native of Italy.

Coronilla varia has elegant particolored flowers of white and pale red. *Clematis erecta*, four or five feet high, increases in size year after year, and presents white masses of bloom which are fragrant. The *purple fox-glove*,—the finger hat of the Germans,—claims a place for its beauty and singularity. *Lychnis fulgens* from China, is crowned with the richest scarlet.

Four herbaceous species of *Spiraea* are known to florists, two indigenously to Europe, and two to this continent, besides a Siberian variety of our *S. lobata*.—The two first sorts (*S. filipendula* and *S. Ulmaria*) afford double flowers, which like *S. aruncus*, are white. The last species however, differs widely in its florescence: The flowers though minute, are almost countless in number, and are disposed on spikes constituting panicles. It is very showy, and very regular in appearance.

Iris is a family represented in this month by some elegant individuals; but florists cannot always acquire the correct name, and botanists are often puzzled with garden specimens. One of the loveliest of the tuberous rooted section, is in this condition. The stem is eighteen inches high, with large flowers of a light but most delicate blue.

Iris siberica exhibits its fine variegated blossoms on the top of its stems three feet in height, while *I. decurva* half hides among its leaves, the beautiful markings which nature has given it. *I. florentina* in such white is one of the sweetest of its tribe. Two thousand years from Spain run into many varieties

which are very attractive, and are known as the *Spanish* and the *English Iris*. The latter is later, and has larger flowers, but both are rich in colors.

The old-fashioned *honey suckles* that charmed us in early life, still diffuse their odors; and no garden can be well furnished without them. The honey suckles from China and Japan, though in request, are inferior to those natives of England. The *trumpet honey suckles*, yellow and crimson, are pretty but not fragrant.

Phlox, in some of its species, flowers from spring till the approach of winter. *P. orata* and *P. carnea* a foot high, are pretty. *P. undulata* a little taller, is pale and less conspicuous; but *P. maculata* in its finest varieties, exceeds every other at this season, in the color, and in the size of its flowers. It is a native of low fertile grounds, and is more superb in such situations. The white variety (*P. suarcolens*) is splendid in a rich shaded border.

Pinks like roses, are always presumed to be fragrant; and in combining neatness and sweetness, excel most other flowers. Room should be made in our borders for more varieties of this interesting family.

The *Lily (Lilium)* is the flower of summer. The *Daurian lily* resembles our *L. philadelphicum*, but bears the sunshine of the open border. *L. pyrenaicum*, often improperly called *martagon*, is elegant but strong scented. The *orange lily* in its several varieties, deserves to be admired. *L. canadense*, indigenous to our woods and meadows, stands next to *L. superbum* in beauty, and before it in hardihood,—growing well in any rich border. But the old *white lily* that charmed the florists of former ages, still keeps (or ought to keep) its place as the first on the list of excellence. Its purity and sweetness are unrivalled; but in this northern land, it requires shelter in winter.

Signature Corrected.—The article on "The Flowers of Spring" in our last Number, P. 92, was signed X by a mistake of the printer; it should be marked thus t.

An Improved Plough Clevis.

Messrs. Editors.—I send you a description of the clevis attached to a plough which one of my friends lately imported from Europe, and which all who have seen it believe to be a decided improvement.

The above ent needs but little explanation. The upper sketch shows the top of the beam and clevis, and the manner of regulating the width of the furrow. The two extra holes on the furrow side of the clevis, are used only when ploughing head-lands, so as to allow the plough to gather nearer to the fence. The hook & swivel are connected with the large clevis by means of an ordinary clevis of small size. This arrangement is very convenient, as the whipple-trees can be put on or taken off without drawing a single bolt.

The lower sketch shows the landside of the beam and clevis, and the manner of shifting the clevis so

as to regulate the depth of the plough or furrow.

Respectfully yours, W. N. H.

Vates Co., June, 1840.

* By a mistake of the engraver, the two extra holes are made to appear on the land side, instead of the furrow side.—Eds.

Slugs on Fruit Trees.

According to our predictions last month, the eggs which we noticed on the leaves of the pear trees, soon hatched, and produced the slimy worms or slugs which have so greedily injured pear and cherry trees in this region, for several years past. We, and some friends took considerable pains to discover the parents of these animals, but were unsuccessful. It will be seen on p. 107 (this number,) that our correspondent J. thinks we "make quite a mistake in considering the slug the larva of an insect;" or, in other words, that the eggs are deposited by a fly or moth, and that the slugs undergo transformation. He says the slug belongs to the class in Zoology called *Molusca*, order *Nutacea*, genus *Lymax*. If so, it is not properly the larva of an insect, but a perfect animal, and undergoes no transformation. Now, with all possible deference to our esteemed friend J., we are constrained to believe that the "great mistake" is on his side; for in the first place the animals with which he classes it, are described by naturalists as being destitute of feet and legs, like the snail, but these possess both feet and legs in perfection. In the second place, the eggs appeared in such abundance, and so rapidly, that it would be impossible for such slugs to deposit them, unless they were quite numerous; and no such things could be discovered on the trees at that time, or until the eggs were hatched. Consequently we are still of the opinion that the depositors of these eggs are "some kind of a fly or moth."

We shall doubtless soon be able to set the matter at rest, however, as we intend to watch their movements closely, in order to ascertain what changes they undergo, if any; and in what form or manner they pass the winter. We hope friend J. and others, will assist in the matter, so that we may obtain a better knowledge of this seemingly nondescript enemy of the fruit garden.

Since writing the above, it has occurred to us that we may have mistaken the meaning of our friend J. It is probable that he only objects to our use of the term "Slug," as he did not intend to be understood to say that the insect referred to by us belongs to the genus *Lymax*; but merely that the true Slug or naked Snail does. In this sense his remarks are correct.—We did not intend, however, to use the word "Slug" as a scientific term, or with scientific precision, but merely to denote an animal of slug-like appearance, by the name which we believe common consent has applied to it in this region, where the true slug, or naked snail is not commonly known.

Persons whose trees are infested with these slugs, should lose no time in sprinkling dry ashes over them. Repeat the application two or three days successively, and it will generally kill them.

Revival of the Silk business.—We are pleased to hear that the Silk Company at Northampton have completely re-constituted their establishment, the operations of which were somewhat paralyzed by the times, and they are now progressing with every prospect of success. The sewing silk manufactory at Nantucket, continues in the same prosperous career that has attended it from the commencement. The bounty laws of Massachusetts, Vermont and other eastern States, have had the desired effect by inducing numbers of persons to turn their attention to this pursuit; and tens of thousands of Mulberry Trees are now being planted in those States for the purpose of raising silk, and has caused quite an animated demand for them, and they have in consequence, been again selling at very fair prices.—Eds.

From the Farmer's Cabinet.

Dialogue—Cultivation.

Frank.—Father, our conversation on pruning has never been absent from my thoughts; it has indeed proved, as you said it would, a source of great delight and instruction to me. I often visit the tree which you pruned at the time, and am astonished to find how very correct you were in all your ideas respecting the manner in which that work ought to be done; and how true to nature is the similarity between the cultivation of trees and the management of children—some of which might be pretty big ones too.

Father.—The more you reflect upon and examine the subject, the more interest you will feel, and the clearer will be the truth of the observation.

Frank.—I have no doubt of it, for I find myself making new discoveries every time I visit that tree; it might be said to be a living lesson.

Father.—Good—and do you ever remark the three branches which we particularly noticed at the time of pruning, and which we named William D., John Tamms, and Sister Susan?

Father.—Indeed I do, very particularly, and cannot help thinking they were pretty good likenesses. The fine large branch, so tall and so straight, which, when you had treaded down, I thought you had spotted the tree for the whole year, has, from the part which remained attached to the tree, thrown up two beautiful branches, one on each side, like twins, exactly of the same height and size, of a deep-red color, which, I have heard you say, is a sign of fruitfulness; and they are clothed to the very foot of the stalk, with buds and leaves at short distances—and that is, I believe, another good sign; and more than that they are shooting up into a part of the tree which before was thin or branches, filling the vacancy, and rendering the tree much more beautiful than it ever could have become, had that branch remained as it was. These new branches are indeed, as you said they would prove to be, "useful as well as ornamental, affording shelter to their parent, instead of shooting above, and out-topping the tree; exposed to every blast that blows"—What a pity that William D.'s mother had not received the benefit of such a lecture "on pruning" in her youth!

Father.—But what did you remark of poor John Tamms? do you think he is the better for the training which he received?

Frank.—I was just coming to him; he still shows that he is too willing for his strength, for he is loaded with nut from the bottom to the top, and which it is not possible can ever be brought to perfection; I suppose you will have to pluck off more than one half.—The appearance of health and strength is, however, much increased, and although the branch will always remain like poor John, deformed, yet by careful and kind treatment, it might long continue one of the most useful, although not one of the most ornamental branches of the tree; a living proof of the value of judicious training.

Frank.—Well, now for Sister Susan.

Frank.—Oh sweet Sister Susan! indeed the likeness is complete! there is the pretty red branch, and the beautiful shining leaves, with fine fruit peeping from beneath them; all of the same size, and growing exactly where they ought to grow, with the red and white so sweetly mixed, although still a small in size, with a fading shoot from the top of the branch, covered with leaves; without blight, or canker, or mildew!—Oh it is pleasant to look upon! this comes of good training.

Father.—But is there any hope of Frank on the other side of the tree?

Frank.—There is—and the first time I saw the bud bursting from the body of the tree, I confess that I was quite overcome by my feelings; Oh, could I not watch its progress and witness its growth and tenderness with anxiety!

Father.—Let but my prayers be granted, and I shall have abundant cause for rejoicing.

Frank.—But, Father, is not the growth of the tree dependent, in a great measure, upon the kind of soil in which it is planted?

Father.—There, my boy, you have had open a large field for observation and reflection; and suppose now, we follow it out, and see if it be not true, that "the growth of the tree is influenced, in a remarkable degree, by the nature of the soil in which it is planted." Shall we divide the different qualities of the soil in the following manner:

- 1st. The heavy soil—neither too heavy or too light, too wet or too dry.
- 2d. The heavy soil.
- 3d. The too light, or sandy soil.
- 4th. The wet soil.

5th. The dry and impervious soil.

6th. The rich surface, and sterile sub-soil.

7th. The poor surface, and rich sub-soil.

8th. The sour and stubborn soil.

9th. The rich soil, with poisonous sub-soil.

10th. The sickly, or too highly manured soil.

Frank.—Well, here are varieties of soil! shall we be able to fit them all with likenesses, do you think?

Father.—Many of them will be easily matched, I think—and to begin with

1st. The happy soil: which requires neither liming, manuring, draining, or watering—whose excellent properties are so nicely blended, and whose productions are so beautiful, rich, and in such profusion—can any thing be more like the Founder of the Ladies' Depository in Philadelphia?

Frank.—Oh, excellent! a real portrait.

Father.—2d. The heavy soil, which produces a thick and burly bark, short, coarse, rough leaves, with short, crooked branches; and fruit, although of a healthy growth and color, with no delicacy of flavor; bitter to the taste, with large pits, to which the flesh of the fruit adheres very closely. The tree comes late to bloom, and the fruit ripens late; but it is generally a good bearer of fruit, such as it is. Now, who is this? or shall I name him—what do you think of Tom Dobs, on the other side of the hill?

Frank.—As like as life! even to the shortness and roughness of his limbs: a hard working man, but rough and brutal in his manners; and although he provides for his family as a duty, to the pleasures of the task he must be a perfect stranger; his children are coarse in their manners, and sour in their dispositions; and are never sent to school; hard workers, however, and they produce much fruit, such as it is.

Father.—Very well—now shall we cultivate the soil as we go? This tree requires but little pruning, you will observe, as it produces but little wood; all that it does produce, however, it ripens well.

Frank.—Yes, let us cultivate as we go; now, how would you set about it in this case?

Father.—It would be merely to trench about the tree, dig in a good quantity of sandy loam, with lime as a succedent, and depend upon it, in a year after, the results would be manifest—a more open disposition, warmer feelings, sweeter fruit, a more luxuriant foliage, and a smoother bark. Now for

No. 3. The too light, or sandy soil. This is indicated by a tree of a weak and sickly aspect; long and thin branches, very thin and light-colored leaves; comes early into bloom, and is very apt to blight in the spring, if the sea-air is cold; it sometimes, however, escapes, and then it brings an early crop of sweet fruit of little flavour. During the summer it throws out much thin and long wood, which is sure to die back in the winter, rendering it necessary the next spring to tread down almost every individual branch. It sheds its leaves early in the autumn, and its weak limbs are very liable to be broken and wounded by the storms of winter. Now, who is this?

Frank.—Oh! I know that—it is Samuel Slimm, the tailor in the village, and is it not like him? you know how tall and slim he is, and how sickly he looks, and how thin and sandy-colored his hair; active and industrious, but complains of the steepness of the hill behind his house, and is not able to leave his home until the season is warm, and the cold weather has passed; civil and kind-hearted, but with little energy, either of body or mind; while on the approach of winter he keeps to the house, and suffers from every change of climate. Now, you must be gentle in the cultivation of so tender a subject.

Father.—Yes, I would trench up the sand, and mix with it a large dose of strong manure and lime compost; prune very close, leaving but about three buds on each branch, and look well to the worms, which such a weak and tender subject is pretty sure to be infected with.

No. 4. Is the wet, a most unhappy soil, truly! It is shown by strangely formed branches, sometimes smooth and straight, at others crooked, burly and rickety; with leaves of different sizes and shapes, smooth or wrinkled, green or yellow, thick or thin, just as the season happened to be during their growth; the tree generally gladdened with too much moisture, and in a happy state only when others are parched with drought; yielding more uncertain than its fruiting; sometimes producing largely at a time of general failure, or barrenness in the most fruitful season. The wood which it makes during the summer, being back almost the whole of its length, but shooting again vigorously from the first young buds in the spring; sometimes faulty to appearance, with large promises of productiveness, seldom realized. Now, see if you can find any one so unfortunately situated, spoiled in life

Frank.—Well, to be sure it is a wretched picture, and yet, I think, your James Snooks, the shoemaker, is the prizable object. You have often remarked, as he is named, that he is the strangest being you ever saw; lively in a time of sadness, and gloomy and sad at merry-makings; always preparing to do great things, but failing, just at the time when great exertion is necessary; sick, but not sorry; sorry, but not sick; doing more work in a week than any one, and less in a fortnight than all; joyous, grievous, bright, and gloomy, all by fits and starts. Now, how could any thing be done to recover so pitiable a case?

Father.—It would indeed, require a regular course of medicine, and strong measures, but even here should not despair of success. I would fairly remove the tree, clean the roots, dig out the earth to a great depth, and in a declivity, I would drain the soil; if on a level, fill the hole with about eighteen inches of brick and mortar rubbish, and well ram it down; and upon this I would spread a thick bed of good mould and lime, replace the tree, and support it by tying it to stakes with hay ropes, and my life on its recovery; looking well to the worms, however.

Frank.—Well, these would be decisive measures at any rate.

Father.—Yes, and would be decidedly efficacious.

No. 5. The dry and impervious soil, shows a tree poverty-stricken in all its parts; unable to do much, notwithstanding its little to any good purpose; brisk and lively, however, in early spring, and making exertions to push into bloom and leaf, but cramped and spell-bound midway; the under leaves fall prematurely, but the wood which it makes during the summer is retained through the winter, although but little of it; stunted and bark-bound, but healthy in a degree, and not liable to be affected by the worms, for that reason. Now, this is so common a character, that we have known many such, who are truly to be pitied. To recover such a tree, it is only to "dig about it and dung it, and let it stand another year," adding, however, a good portion of lime with the earth, on filling in.

No. 6. The rich surface and sterile sub-soil; frequently to be met with, and often the cause of disorder, disease, and death, to the tree that is planted in it; the richness of the surface-soil calling forth early spring foliage, and the most promising expectations; the sterility of the sub-soil causing a lamentable falling away of the brightest hopes, and the most grievous disappointment. In early youth, it is lavish of foliage and the sweetest blossoming; all opens well, and it should be, and no one would suspect the mortification which is sure to follow, when the roots have penetrated to the poverty-stricken soil below. Now, this is a character which is, unhappily, very common, and is aptly figured out in the case of William D., in our former conversation. Hundreds of such young men reared in the rich surface-soil of paternal affection; their cultivation neglected through a mistaken fondness, after giving promises of the most enviable greatness, are doomed to poverty, disgrace, and contempt through the want of the proper stirring of the sub-soil—the only security for paternal hope. Such cases require a strong hand; nothing less than a regular trenching will be of any avail; the rich surface should be turned down, and the sterile sub-soil be brought up, to be enriched by future dressings, lime forming a large proportion in every stage of the business; for it is much to be feared that the worms will be found to have made sad havoc near the root of the tree, as, disease arising from the poverty of the sub-soil, will, in all probability have engendered life. Lime and deep trenching will, however, heal the malady, if applied in time. To the disease is owing the change of colour of the leaf before the autumn, and the falling of unripe fruit, with many other symptoms of premature decay.

No. 7. The poor surface and rich sub-soil are also very common, and before the tree can reach the good soil beneath, poverty has stricken it, and many there are which perish for want of sustenance, not having strength sufficient to reach the buried treasure; the languish for want of support, and without timely assistance are doomed to starvation. We may find many semblances to this case, I fear, amongst the children of the poor and friendless; for, according to the poet

"Full many a flower is born to blush unseen,
And waste its sweetness on the desert air."

Frank.—Yes, and I know one who is so unfortunately circumstanced; it is poor George Hastings, an apprentice to the blacksmith; how I pity him, when see him drawing figures with chalk upon a board, an hear him sigh, because he cannot read! while his brilliant master checks every attempt at improvement, and does all in his power to keep him in ignorance, that he may the better suit his selfish purpose. "wondering what such a one as he should want with learning."

he could be helped forward, I have no doubt he could make great progress, for he is remarkably bright; but he has not strength of him-self to reach the rich soil.

Father.—This is the easiest of all the disorders above enumerated, to cure: it is only to dig deep into the surface soil, some good compost and lime, repeating it for a time, when it will soon be found to strengthen the roots, so as to enable them to strike deep enough to reach the rich sub-soil, and so to help themselves.—I will look after George Hastings, remember: I dare say we can assist him, until he is able to help himself.

No. 8. The sour and stubborn soil. A wretched indeed! nothing but discontent and disorder can ring from it. The tree that is planted in such a soil, exhibits almost all the disorders that trees are heir to, the rough and knotted bark, the faded leaf, the late fringing, and early falling of which, show the malady obtained in its system—the crooked branches, and the short shoots of a whole summer's growth; while the canker-worm is ever grinding his way between the bark and the body of the tree, destroying its energies, and crippling all its exertions? I suppose you will not go to a loss to find a poor unfortunate neighbour, who too much in the state of this pitiable tree.

Frank.—I cannot be mistaken, it is poor farmer rabbi! and see, here he comes, that's remarkably old! and how strangely he looks.

Father.—It is so, but strange as he is, and deficient energy and perseverance, he is greatly to be pitied, as well as blamed, for the world appears to him a blank, even worse; the errors of his education, too, haunt him, and he is always foreseeing coming events of the most gloomy character; poor man, all goes wrong with him, because he takes things by the wrong end, good day, neighbour, this is fine weather isn't it?

Grabb.—Ah, 'tis all very pretty while it lasts, but I see, very plainly, that a change is coming, for the old ooster, when he crow'd this morning, turned his tail to the rainy quarter, and that's a pretty sure sign with me, that we shall have it again before long: I never saw too much fine weather at this time of the year, and I dare say I shall not be too lucky as to be disappointed in my expectations now; indeed I looked for it before this, or I should have dragged down my plow, as you have your's to-day: you know the song ye, "sunshine's succeeded by rain," and so I am sure, it has always been with me through life, and so, have no doubt, it will continue. If I want sun, it rains; and when I want rain, the sun will shine in spite of me—it's enough to sour a crab—but here comes father Sykes—how do, neighbour?

Sykes.—Why, thank you, neighbour Grabb, well and happy. My friend here, and I, have worked down to-day, and I am now come to invite him to join me in a work of charity, in going over to the widow Williams, to-morrow morning, to assist her in this her need of need. But why didn't you drag your fallow to-day? it would have worked finely: I fear you will not be ready for sowing turnips, as this is only your first ploughing, you know.

Grabb.—I do do know it, and was always sure I could be behind-hand: but you see, I thought we would have rain to-day, and was afraid to begin, lest it should be caught in the midst of the work: I wish now that I had done as you have, for nothing would give me more pleasure than to accompany you to-morrow—hang it, I think I will do so too.

Sykes.—No, you cannot, for you owe a duty to yourself and family, and until that is performed, you have no right to share in the "luxury of doing good." Charity begins at home, remember, and so you must rag down your fallow to-morrow. How I enjoy those yo verses which we sing every night before going to bed! the feeling is heavenly!

"Oh! sweeter than the fragrant flower
At evening's dewy close,
The will untied with the power,
To succour human woes!

And softer than the softest strain
Of music to the ear,
That placid joy we give and gain,
By gratitude sincere!"

Grabb.—Ah, times goes gaily with you! I'm sure never feel in the humour to sing, either at night or morning—mine's a very different feeling. I often say, I was born to be unfortunate, and I have no doubt it. God knows my heart; and as I say to my wife, here am I, with the best intentions in the world—but must go, for I dare say I am wanted in twenty places to-day by this time.

Sykes.—Yes, there is one that wants you, I know—but confounded old rooster of yours—there he stands, with his tail in the wind, crowing away like mad.

Grabb.—Does he, though? then I'll be bound we shall have it to-night, after all, for he is pretty generally not far out in his reckoning—so, good bye.

Notes on European Agriculture.

[Taken by a Southern traveler and published in the Southern Cabinet, Charleston, S. C.]

AGRICULTURAL SOCIETIES.—The benefits of Societies for the promotion of Agriculture, in stimulating industry and ambition, I saw exemplified in Scotland, England, and at the Fairs of Germany. The Highland Society of Scotland has existed sixty-one years, and from one of the bleakest and most sterile countries of Europe, Scotland has, with all its disadvantages, risen to a state of agricultural prosperity, far beyond anything which could have been expected from such a soil and climate: and some of the counties, especially the Lothians, are not inferior, in point of cultivation and product, to the richest in England. At a meeting of that Society, held a few weeks previous to my arrival, 177 members were added at one time, paying three guineas entrance, and one guinea annually, and these included the names of the most respectable men in the country. At this meeting, there was an additional sum of £11,500 (\$7,000) subscribed, to promote the interests of the Society. Every agricultural county makes an annual report, and this thirty-three reports, embracing every object of agricultural interest, are annually submitted to the Society. English Agricultural Societies, although with less uniformity, are ardently engaged in the same cause, and the result has been the general diffusion of agricultural knowledge. The different soils have been analyzed—the kinds of manures and modes of cultivation adapted to each, have been pointed out. The steam engine has been introduced in thrashing and for other agricultural purposes, and Great Britain, (including Ireland and Scotland, which formerly averaged only nine bushels of wheat to the acre; last year produced in the aggregate, 192 bushels; and three of the counties of Scotland, and several of England, averaged 51 bushels to the acre.

TRICE METHOD OF FARMING.—A farmer by the name of Thomas Oliver, residing five or six miles from Edinburgh, leased a farm for the last twenty years, of 150 acres, paying annually a rent of 10 guineas per acre, (\$7,500) on which he raised grain, hay and vegetables for the market of Edinburgh. This lease he has recently renewed for fifteen years, (the usual time to which leases run) on the same terms, and from a poor man he has become independent in his circumstances, and now rides in his carriage. What American Farmer could make a profit that would enable him to pay such an enormous rent? All may be accounted for on the principles of judicious management and careful industrious cultivation.

AGRICULTURAL FAIRS IN GERMANY.—On the continent, especially in Germany, their annual fairs bring together the farmers and peasants of all the surrounding country, where their ambition and industry are stimulated by a variety of fetes, the distribution of prizes to successful competitors, and whilst Princes, Dukes and Barons are engaged in awarding prizes to those who have been most successful in the cultivation of grains and cattle, their lovely wives are occupied in a humbler, but much more lively scene, in complimenting and distributing premiums to the industrious housewife, for her fine specimens of fruit—her butter and cheese—her linen cloths, weaving, knitting, and other manufactures. I have no doubt I shall be ridiculed for my want of taste, when I state that to me, the Grand Duchess of Baden, presenting a silver cup to a peasant girl, before an assembled crowd of farmers and nobility, for the finest specimen of manufactured gloves, was a more interesting sight than that of the gay Queen Victoria, racing through St. James Park, with fifty fools at her heels, striving not to be distanced by their lovely mistresses.

UNMULDERATED SEEDS.—In the preservation of seeds, of grain and vegetables, infinitely more pains are taken to preserve the varieties distinct and unmulderated than with us. In the mountains of Scotland, there are certain districts appropriated solely to the cultivation of Garden seed—and no two varieties, that are in danger of becoming adulterated by being placed near each other, are allowed to be cultivated in the same district. I noticed, at Edinburgh, in the collection of Lawson & Son, Seeds-men and Nurserymen to the Highland and Agricultural Society of Scotland—83 varieties of wheat, 62 of peas, 51 of turnips, 116 of potatoes, and an immense number of species and varieties of Grass seeds, some of which may probably be adapted to our Southern country. In a subsequent number, I will endeavor to recur to this latter subject, and point out those species, which it would be advisable to make experiments.

AGRICULTURE OF EUROPE.—From a cursory review of the cultivation of the various kingdoms of Europe, it appeared to me that England was in the highest state of cultivation, and which, from its beautiful thorn hedges—its neat cottages, adorned by the elegant homely-yet and ivy, chequered here and there by the park and lordly palace, rendered the whole land a picturesque garden. Some of the counties of Scotland, such as the Lothians and the earse of Sterling and Gowrie, are in no wise inferior. The little I saw of the cultivation of Ireland, rather exceeded my expectations. Belgium and portions of the Netherlands, have a better soil than that of England, and are fully as productive, but they want neatness of cultivation, and, like the whole continent of Europe, are destitute of fences and hedges—to me the fields wanted ornament, and the cottages seemed without much comfort. The fields of Denmark were loaded with an abundant crop of wheat, but there, as well as every where else, I heard bitter complaints of hard times, and the severe exactions of Government. I frequently thought that it would be no bad plan for our American gumbler about taxes and oppression, to take a trip to Europe, and learn a wholesome lesson. Take my word for it, it will stop the mouths of demagogues, reconcile them to their own country, and they would return—not as politicians, but Americans, saying, I have sinned against heaven and my native land, and am now only worthy to be called thy son. I found the Grand Duchy of Baden and parts of Wittenburg, better cultivated than Prussia in general, probably because the soil was more susceptible of improvement. Switzerland is too romantic to be rich—and the Rhine is too classic a stream to be the rich river of commerce, or be surrounded by any thing else than mountains where the vine clammers along its sides and the ruined castle looms on its lofty peaks. In the cultivation of France, I was greatly disappointed—the sword has scarcely had time to be bent into the ploughshare—the soldier finds it hard to stoop to the labor of the harrow and the hoe, and seems disposed, yet a while to leave this drudgery to the woman. Austria, with its fine soil and climate, is retarded in agricultural improvement by the wealth of its nobles and the oppression of its peasantry. Its possessions in Bohemia appeared rather better cultivated than those portions bordering on Hungary and Venice.

THE BOONS.

The Moss Rose and the Harp.

BY MRS. S. F. THOMSON.

When the stern mandate from on high did come
Unto the gaily pair who'd sim'd and fell,
To seek, beyond the gates of heaven, a home,
It snate their spirits like a funeral knell.

She clasped her hands in anguish and despair—
"Ah! must I leave thee, Paradise, so soon?
Flowers that will wither in a colder air,
Now fare thee well! Oh! bitter, bitter doom!"

"I cannot part with all—this bursting rose
Which I have nurs'd and cherish'd here so long,
The brightest, sweetest flower that grows—
Oh! God forgive me and its life prolong!"

In the cold, cheerless world to which we go,
Grant it to blossom in its leathey there!
My tears of penitence shall o'er it flow—
Oh! grant thy lowly suppliant's pining prayer!"

The prayer was granted. "Round thy stem was twined,
Cuddling moss; a kindly guardian given,
That it might live in an ungenial clime,
A thing of earth, and yet a child of heaven,

Did Adam, ere he wander'd, ask no boon,
And bend his way to other spheres?
Or, in his bursting heart, was there no room
For anguish but penitence, or anguish but tears?"

He touched his golden harp when at the gate;
In one long, lingering strain, o'er heaven it swept,
So sad, so wild, so truly desolate,
That e'en the angels bow'd their heads and wept.

"Oh! give me thine, my own, my much loved lyre
Take it not from me—'tis a harp of heaven;
Dear to my heart is every golden wire—
Oh! leave me this, or my crushed spirit's given!"

The boon was granted. On their lonely way,
Far from the realms of hope and light above,
The rose, an oasis unto them by day;
As night, the harp breathed out a song of love.

And thus to Earth came Man's weeping spell:
Ere unto mortal it had e'er been given,
For who so pure, or who can soar so well,
As e'er to catch the melody of heaven!

Beta Frank in

Agriculture in Upper Canada.

We have just returned from a tour of two weeks in Upper Canada, during which we saw and heard much that was interesting to us, and some account of which would doubtless interest many of our readers; but we have only time and space for a few remarks at present.

Appearance of the Crops and Farms.—The crops generally look very promising in most parts, especially on such farms, as are properly managed. Vegetation is about ten days later on the north side of Lake Ontario than on this (the south) side. The wheat crop looks fine, but is not as forward or as heavy as in Western New York. We noticed some fields where the crop was very light, although in a good part of the country. On asking one farmer the reason for his scanty crops, he replied the land had been twenty years under cultivation, and had become "worn out." He was one of the early settlers, and when he first came there his land produced very good wheat, corn, and potatoes; but now it would only produce rye, or a light crop of wheat or grass. Every thing within and around his house and on his farm, bore unequivocal marks of the "skinning" system of farming. Nor was this by any means an extreme or solitary case. We have never, in all our travels, witnessed so great a diversity in the practice of agriculture as in Upper Canada. Many of the farmers are evidently far "behind the age," and utterly ignorant, or regardless of the great discoveries and improvements in agriculture which have of late wrought so beneficial a change in England and Scotland, and the United States. The use of clover and other green crops for improving the land; the use of plaster, lime, ashes, marl, &c.; the culture and use of root crops, and a judicious system of rotation, are matters about as well understood by many as is the agriculture of China. At the same time there are some farmers of great intelligence and enterprise, the appearance and profitability of whose farms are a conclusive proof of the advantages of science: and are a standing rebuke to their less enlightened neighbors. It is sensibly necessary to remark that we could, in most cases, decide from the appearance of the premises, whether the farmers were readers of an agricultural paper or not.

Agricultural Societies.—The government of Upper Canada has made liberal provisions for the encouragement of agriculture, and provides for the formation of agricultural societies in each district or county.—A sum of money, equal to twice the amount raised by the members, is given by government, to be awarded as premiums and expended in purchasing improved stock, seed, &c. Thus, if two hundred dollars are raised by the members of the society, the government gives four hundred more. With such aid it might well be supposed that the societies would be sustained with much spirit, and prove of great utility; but while this is the case with some, we were surprised to learn that others were kept alive with great difficulty, or had been entirely given up, for want of sufficient interest being felt in the subject by the community.—The mind of the farmers are not awake to the importance of the subject, and in no country have we ever seen so much need of something to *stimulate the mind*, or of *circulating agricultural periodicals*. Let the "New Genesee Farmer," or a similar paper, be read by all the members of the agricultural societies, and new life would soon be imparted to all their operations: a new interest would be excited on the subject of agricultural improvement, and a new impulse would be given to the prosperity of Upper Canada—a notwithstanding all the political or commercial embarrassments which may for a while retard its progress.

Some of the officers of the societies, and other friends of the cause, with whom we conversed, are beginning to see the importance of this subject, and

are exerting themselves to place the paper in the hands of every farmer in their towns or neighborhood.

We have made arrangement with several correspondents in that province, who will send us such information and communications as will more particularly interest the farmers in that country. And we intend to resume our rambles there in a few days, so as to obtain a more intimate knowledge of the soil and farming, in order to direct our efforts more successfully for their improvement. We intend, in our next number, to give our readers some more particular notes and observations on Upper Canada, made during our tour in that province.

For the New Genesee Farmer.

Breaking Steers.

MESRS. EDITORS.—A correspondent in your last paper asks to be informed "how to prevent Steers from being sulky when breaking them for the yoke."

I answer—treat them with *gentleness and kindness*. As in the human so in the brutish species, we must expect to find a great disparity of temper and disposition: and so vicious and obstinate indeed are some that they cannot, even by the wisest means, be rendered entirely docile. Much, however, may be done by discreet management. And here permit me, *as you value a good character and a good conscience*, to warn you against all manner of cruelty, severity, or rashness, in breaking steers or any other animals.

The winter before your steers are a year old, shut the pair you wish to break into a yard apart from other cattle: yoke them and tie their tails together as gently as you can, and leave them, to break themselves in their own way, some six or eight hours; then untie their tails, take off their yoke, and let them go. Repeat this process whenever convenient, during the winter or spring, till they shall become gentle and tractable in yoking and unyoking, and shall have learned of themselves how to walk even, turn about, &c., in the yoke. You may then, if you choose, (treating them tenderly,) drive them about until they have become somewhat familiar with the words of command; but take heed you don't put them to draw a load, or errand your boys to jale them about, lest it should impair their strength or ambition. Thus trained, turn them out and let them run till you wish to work them; at which time, (even though it should be several years,) you will find them as tractable as when you last unyoked them.

But perhaps your steers are already two or three years old, and as untamed as the Buffaloes of the forest. In this case put them into a small strong yard and, in the gentlest manner possible, put a yoke on one of them—taking out the spare bow—and let him go with it till he shall become familiarized to wearing it. If you have another yoke you may do the same by the other steer at the same time: if not, give them a turn about with the yoke till they become somewhat subdued. Then yoke the pair together as civilly as possible, i. e. their tails, and treat them as directed in the case of the calves. When you commence driving them, if unconsciously sturdy or wild, it would be prudent to halter the near one lest they might get the advantage of you in a race; but don't rely on your halter in one hand and a short whip in the other for managing your team; you can never drive your oxen in this way; take the old-fashioned cart-whip in both hands, and with this, guide, direct, and enforce your commands. On putting them to work, if with a yoke of oxen, put them, (not as is commonly practised behind, to be dragged about by the horns, but,) before; where, properly managed, they will very soon become quite handy and obedient. Their temper, ambition, and constitution will be unimpaired; and, (the last not least,) your conscience will be clear from the sin—

too common to farmers as well as others—of cruelty to the brute. C....

Scalding Seeds before Planting.

Since last month we have made several experiments on scalding Seeds with very different results, some favorable and some unfavorable. From these it would appear that such as germinate readily, are most impatient of heat; and were it not so, but little advantage could be gained by this treatment. Our investigations hereafter, will therefore be confined to such as require a longer time to come up, or grow with more uncertainty.

On melon seeds, our experiments were unsatisfactory, though some bore it well. Scalded seeds of the giant rhubarb, came up three or four days sooner than the unscalded, and in greater numbers. To sweet corn, the scalding was destructive. On the early yellow corn, it was not favorable, though a part is growing. The most flinty grains, we suppose will bear it best; and though we have often seen corn scalded to advantage in a warmer climate, we cannot recommend the practice in this district.

An earthen vessel containing about two quarts, was filled with seeds of mangel wurzel and boiling water. These have come up beautifully—better than we have ever seen them do before. Carrot seeds were damaged by the operation.

The seeds of leguminous plants often germinate very slowly. Those of the Scotch broom, and yellow Columba, will sometimes lie in the ground for years before they grow; and there is reason to believe that those of the common locust will lie dormant for ages. Burning the surface of the soil often gives them a start, and we should not think of planting them without scalding.

Some seeds that cannot bear scalding however, may be benefited by soaking at a lower temperature—blood heat for instance: and it has been mentioned that carrots may be sprouted in this way to advantage. But some seeds will not even bear soaking. Of this kind are the red and purple Clary (a species of the snig) which soon become enveloped in muelage. In this condition, we have never known them to grow. †

Garget--Heaves.

MESRS. EDITORS.—Having noticed in your last number "E. F. M's." inquiry for a cure for the Garget, I send you the following two, hoping they may be of service:—

Take a piece of poke weed root (*Phytolacca decandra*) about the size of a goose's egg, cut it fine, mix it well with a mess of bran or Indian meal, and feed to the cow four or five days and longer if you can perceive that it is beneficial. It should be given but once a day, and the udder, meanwhile, should be kept as free of milk as possible.

I cannot attest personally to the efficacy of this remedy, but I obtained it of a neighbor of undoubted veracity, and believe it to be both safe and effectual.

The other remedy was given by a stranger as infallible. He said, take three or four green frogs and let them jump down the throat of the cow. (Frogs are sometimes given to horses and are known to be harmless.) But if the disease of E. F. M's. cow is of long standing, it may be incurable. If he attempts to cure her, as doubtless he will, I trust we shall be informed of the result through the medium of your valuable periodical.

I would here remark that where the bag is inflamed with Indian meal and water is good to wash it with, and strong salt and water is still better. Soft soap is good in very bad cases, but if applied several times in succession, is apt to make the udder and teats sore.

To the inquiry of "South West" for a cure for the Heaves, I will say that I do not think the Heaves, after they have become settled, can be cured. But

append a recipe, which I suppose is as good as any known.
 Take one pound of antimony, one fourth pound of iron, one half pound of sulphur, and one half pound of nitre; powder them fine and mix thoroughly.—
 Give the horse half a table-spoonful, twice a week, and a cure is said to be almost certain.

Yours, &c., J. M. W.
 Rockport, June 18, 1840.

Cure for Fistula on Horses.

MESSRS. EDITORS—Many of your readers, I doubt not, know from experience, that a fistula on a horse is a sore evil, and one which is very difficult to remove. The following method of cure was made known to me some years since by a German Farrier, who assured me that it would prove effectual; and one of my horses having a fistula, I was induced to try it, though rather incredulous at the time. The experiment was perfectly successful, however, and I have since tried it on several horses with like results. Being fully satisfied therefore that the remedy is effectual and highly valuable, I send it for publication, for the benefit of other men and horses.

Procure a large warty toad, and having a thick glove put on the hand, take up the toad and hold his mouth on to the fistula for one or two minutes; take it off in short time, then put it on again, and rub its back lightly over the affected part, and continue to rub it for about an hour, by which time the toad will be dead and should be buried. The horse will be rather uneasy at first, but after a few minutes he will stand quietly. Care should be taken not to hold your head near or over the place of application, as the fumes are somewhat sickening. A milky fluid, said to be venous, exudes from the warts on the back of the neck which is supposed to give efficacy to the remedy. The sore will discharge freely for three or four days after the operation, when the pipe will come out and the place speedily heal. Very bad fistulas of standing, may require a second application, but in ordinary cases one will prove sufficient.

Yours, &c., R. HARMON, JR.
 Heatland, Monroe Co., N. Y.

Hoof Ail and Foot Rot.

My correspondent, in another column, appears to have confounded the diseases "Hoof Ail" and "Foot Rot" which appear to be quite distinct. The "Foot Rot" or the "Foul in the Foot," of most English Horses, is generally seated between the two claws of the hoof, and the remedy furnished by our correspondent is undoubtedly a good one. An experienced farrier of our acquaintance scars between the hoofs with a hot iron immersed in tar. The "Hoof Ail," however, does not appear to be described by English authors, is a more formidable disease, and is chiefly visited at the crown of the hoof. Various remedies are resorted to, but none that we know of have given any or effectual relief. Sawing off the ends of the hoofs, at the outset, we have however found much the best remedy.

Excrescences on Cherry Trees, &c.

Copy the following from Prince's Pomological Treatise; and we indulge the hope that horticulturalists trying "line upon line" will bestir themselves, and give what the author so reasonably proposes.
 [The common morella is more subject than any other cherry to the attacks of the same insect which so recently stings certain varieties of the plum, and which so often perforates the branches of this tree to such extent that they are covered with numerous knots and excrescences. The only remedy is to prune off all the branches thus attacked at the period when the eggs or its eggs are concealed therein, and to burn them immediately, for if they are left to increase annually they present a most disagreeable appearance, and

in time entirely destroy the tree. The same course may be adopted with success for all other trees attacked in a similar manner; and if it was adopted generally throughout our country, it would in a few years nearly or quite annihilate this formidable depredator on our gardens and orchards.]

Sulphur Showers.

MESSRS. EDITORS—A writer in one of the New York papers, calls the attention of the editors to a recent shower of rain in that city; it being, what is sometimes called a sulphur shower, similar, I presume, to what we have all seen, when the water, caught in cisterns or tubs under the eave of buildings, is covered with a greenish yellow substance, closely resembling sulphur, and very generally mistaken for that mineral. The writer asks "Where could sulphur in such abundance come from?" Some years since, while waiting for a summer shower to clear up, observing the water caught in a barrel under the eaves of my house, covered with this same yellow substance, I took occasion to test its character. Accordingly, after collecting a quantity from the surface of the water, I examined it. It had no particular smell, and I could not discover the slightest appearance of crystallization, which can almost invariably be seen in sulphur in all its combinations. When submitted to the heat, it burned up, leaving a trifling residuum of a character which satisfied me of its vegetable origin; and further investigation led me to the belief that it was nothing more than the blossom or farina, washed by the rain from the moss growing on the roof of the house, a conclusion which subsequent observation has confirmed. I have never found this substance on water remote from buildings, or very early in the spring, or after the frosts of autumn, or on water caught from slate, tile, or tin roofs, or in any situation to negative the origin above assigned to it.

For the New Genesee Farmer.

Mis-Education of Farmers' Daughters.

MR. EDITOR—It cannot be denied that females of the present day generally possess better opportunities for high mental attainments than they ever did before. Men now admit that the spirit of the age, and the genius of our free Government absolutely require that both sexes of the rising generation should be well educated; and consequently we see female seminaries and schools of a high order established in every city, and almost every village. Nor is it the daughters of the rich and fashionable alone, who enjoy the benefit of these institutions; but many of the cultivators of the soil, the true Nobility of our country, begin to see the necessity of giving their daughters something more than a common school education; and therefore send them to what are considered the best institutions in the land;—where they receive an education which in many instances produces the most happy results. But at the same time, any person who has been observant on this subject, must have noticed, that the fashionable education of females at the present day, is often, and I think I may say generally, far from producing a good effect upon the agricultural community.—Many farmers give their daughters a liberal education, with the natural expectation that it will have a tendency to increase their own happiness and the happiness of those around them; but after spending several years, and several hundred dollars at school, they return home, refined and accomplished it is true, but totally unfitted for their situation in life, and soon become discontented and miserable. Indeed I have seldom known a liberally and fashionably educated farmer's daughter who has not soon become tired of a country life, and sought connexions and a residence in a city or village. In many cases I have known them reject the addresses of a worthy young farmer, and accept

the hand of some heartless city fop, who was both destitute of the adequate means of support, and of those personal qualifications which render domestic life happy or agreeable.

So commonly do these evils result from a liberal education, that many honest farmers refuse to educate their children, because, as they assert, it will make them proud, idle and discontented; and if any one attempts to reason with them, they immediately point to the daughters of their neighbors, A. B. and C. who unfortunately afford, to their minds, conclusive proof of the evil of "too much education." Thus the misconduct of a few, prevents many from receiving even a tolerable degree of education, who otherwise would enjoy that blessing.

Now it must be obvious to every intelligent mind, that these evils are not the necessary consequence of a good education, but of a perversion of the mind, or *mis-education*. The truth is, the whole system of popular female education is conducted with reference to *display* rather than *utility*, and is exactly calculated to create a taste for the empty show, and false pleasures of a city; while comparatively nothing is done to impart correct views of happiness, or excite that love of nature, which, to a properly cultivated mind, renders rural life so delightful. It is true, they pretend to teach many of the natural sciences; but they are taught in such a superficial, uninteresting manner, that they fail of producing their proper influence on the mind. A mere smattering of these sciences is deemed sufficient; while the utmost attention must be paid to those studies which enable them to make a display. Indeed much of our popular reading and fashionable literature is of the same evil tendency—calculated to excite a love of fashionable life and amusements, and a distaste for the more quiet, but real pleasures of a country life.

Farmers who rightly estimate their profession, and have a sincere regard for the welfare of their families, should educate their daughters with more special reference to the situations which they wish and expect them to occupy in after life. *True knowledge, when rightly imparted to the mind, will always produce beneficial results*; and farmers need have no fear that a liberal education will make their daughters idle or discontented, if it is only of the right kind. An ordinary fashionable education is well enough for the daughters of Merchants and Lawyers in our cities, who are unwilling to be *useful*, and therefore ought to be *ornamental*; but for the daughters of American farmers, I verily believe that an education in most of our popular seminaries is decidedly injurious. I would not on any account discourage female education, or condemn female seminaries; but judging from my own observation of the effects which are produced, I do think that great reformation is demanded on this subject. Nor would I pretend to point out a proper course of instruction for farmers' daughters; for I am conscious of my unfitness for the task. Unfortunately for me, I too have been mis-educated, or rather I should say, am uneducated; and therefore will leave this subject, with the hope that what I have said may induce some abler pen to enlist in the cause; if so, my chief object will have been accomplished.

Very respectfully, &c.

Maple Grove, 1840.

ANNETTE.

Remarks. We believe Annette has, in the main, taken a very just view of fashionable female education, and we agree with her in the belief that it is not generally well calculated for farmers' daughters. But at the same time we think the evil is not quite so common as she supposes, and we believe that some female seminaries do impart such instruction as is calculated to elevate and improve the minds of farmers' daughters, without producing those evils which Annette so much deploras. We unite with her in the hope that some person of experience on the subject, will enlist in this cause; in the mean time we hope still to hear occasionally from our unknown friend, ANNETTE.—Eds

Caterpillars.

We have seen but two nests of Caterpillars this season, one on an apple tree, and the other on a cherry tree. We destroyed both. What a change has taken place. Fifteen years ago—more or less—we saw these insects in swarms of many hundreds on the trunks of trees; and when preparing to enter the pupa state, they spread over the fields in such numbers, that it became necessary, in order to save our newly transplanted trees from destruction, to visit them as often as once a day.

The Striped Bug.

Every person who cultivates cucumbers and melons must be acquainted with the yellow striped bug. In former years, we depended most on our activity in catching them, chiefly in the cool of the morning and evening; but we have an easier way to manage them. In the hottest weather they are the most active and seemingly the most voracious; and some days ago, when the mercury stood at 80°, aware of this danger, we visited the cucumbers, and found the bugs in great numbers. A sprinkling of quick lime however, scattered them in haste; and we have not seen a dozen since in the whole garden.

But the large brown bug that infests squashes and pumpkins, must be treated differently, and nothing is better than decapitation.

For the New Genesee Farmer.

Views of the Grasses.—No. 3.

12. *Red Top, Common or Fine Bent*, of the English, is the *Agrostis vulgaris* of botanists. Its flowers grow in a spreading panicle, of small loose branches, reddish; culm not much leafy, except towards the root, erect and fine looking; seeks a moist soil. This grass is spread considerably over New England, and is making its way over the country. It seems to yield in England hardly a medium quantity of hay for the first crop, and the latter crop is small also. In this section of the country it occurs only rarely so far as my observation extends. *Agrostis* has its name from the Greek for *field or country*.

13. *White Top, White Bent Grass*, of the English, is *Agrostis alba*, of botanists. It is a rather smaller and poorer grass than the preceding, having a yellowish white appearance in the time of flowering; the culm and leaves too are rather light green. It has creeping roots, and seems to exhaust the soil, and is an unprofitable grass. It commonly attends the other, though I have always found it less abundant.

By some botanists both these species are considered only varieties, though they have a very permanent character.

14. *Flour, or Creeping Bent Grass*, has attracted much attention in Ireland in a few years past. As it sends out creepers or *stolons*, which multiply the culms, it is named by botanists, *Agrostis Stolonifera*. Its seed is now introduced into our country. Some consider it only a variety of *Agrostis alba*, and rank with it another *Agrostis* found in our country. If this is true, cultivation certainly produces a great change in the grass. Sinclair says that *Agrostis alba nectar* sends out runners or *stolons*, while that is a distinguishing character of this grass. Several varieties of the Flour seem to be known, as the *wide-leaved*, the *narrow-leaved*, the *awned*, and the *creeping*; the first is superior to the others. Cut at the time of flowering, the first yielded from an "active peat soil," about *one-seventh* less than Malow Fexal (*Alopecurus*), and about *two-thirds* as much as Orchard Grass (*Dactylis*). This comparison shows that Flour is a valuable grass on the proper soil, and may be found quite an accession to our grasses as peat-meadows come into use.—Its relative value compared with Timothy in such a situation, is yet to be tried. In England the opinion

is not very favorable to the Flour. The moist climate of Ireland may be most favorable to it.

15. *Mexican Bent Grass*, the *Agrostis Mexicana* of Willd. has been introduced from Mexico and cultivated in England for about sixty years to some extent. It is not the same as the grass of this name by Muhlenburg, which Dr. Torrey considers *A. lateriflora* of Michaux. The Mexican grass grows a foot or two high, erect, branching, and has scabrous roughish flowers purplish in a panicle. It yields about the same as the preceding, but is not an early grass for spring. It ripens abundance of seed, and should be cut before that falls. It flourishes in other soils than siliceous, as the clayey or calcareous. It is a grass which can easily be produced after the soil is broken up, so that it answers for alternate agriculture.—*Sinclair*.

16. *Upright Bent Grass*, is known among botanists as *Agrostis stricta*. It bears an upright stem, with many leaves towards the root, and all except the top is a bright green, and is often named as *red-top*, and probably is the English grass of some farmers in New England, growing in the rich and low alluvial soils of some rivers. In England it is not considered a valuable grass by itself, as it yields only about three-fifths as much as the true Red Top, *agrostis alba*.

Besides these species of *Agrostis*, several others of this genus are among the grasses of English agriculture, which are even of less value. *Agrostis canina*, Awned Bent, or Dog-bent grass, is mentioned by Dr. Bigelow among the plants in the vicinity of Boston, and *A. racemosa* is a native about cultivated fields.

17. *Lolium perenne*, L., Rye-grass or Ray-grass, is introduced from England, but is rare. It has the appearance of being a poor grass, though by some English agriculturists it is esteemed considerably, and has long been cultivated. In its appearance it somewhat resembles Couch grass, so troublesome in gardens. The spike of flowers is somewhat loose, with awnless flowers alternately fixed to the stem, and a calyx or glume of only one valve holding three florets. Spread only in small quantity over New England, it must make its way westward. Its seed too is now introduced from England. Several varieties are cultivated in England, for pasture and hay. One has been sown on a grass plot in Rochester.

One species, *Lolium temulentum*, Darnel Grass, the true Darnel, though a grass, is a very offensive weed among English agriculturists. Its seeds are near the size of wheat, bitter, poisonous, and ruinous to flour for bread; they make a dangerous beer, which intoxicates, and the plant has long been called "drunken darnel."—*Sinclair*. It is to be hoped that it will not find its way to us in the samples of wheat from England. It has been said to be the only grass whose seed is poisonous. It has been introduced into New England and Pennsylvania.

18. *Slender Finger Grass, or Slender Panic Grass*, called by botanists *Digitaria sanguinalis*. Its name is from its *finger-like* form, and its reddish colour from being used by the boys to make the nose bleed. Scattered over dry soils it is scarcely considered here more than a weed. Its seed is said to be used in Germany to form an article of food, like sago. It is an annual, growing in rich soils to be productive, and yielding only little hay. Its seeds probably form nutriment for small animals.

19. *Trifolium repens, Couch-grass, Quitch, Dog's-grass*, is of the same genus as Wheat, but an altogether different thing. The calyx is of two leaves with about five flowers on an erect culm. The root is strong, creeping, full of life, perennial, and sends up shoots in abundance. Horses are said to be fond of the roots, and they are very nutritious. The grass answers for pasturing. On account of its roots it is very difficult to eradicate this plant. Its leaves show

up in gardens about and among pinks or any cespitose plants, or in branches of the currant, and the like. Its leaves are eaten by dogs to produce vomiting, probably on account of their bitter extractive matter.

Fire Blight in Pear Trees.

For more than twenty years, we have escaped any serious losses from this formidable disease, though we have seen it occasionally on our trees.—We cut off the branch a foot or more, below the dead part, and burn it without delay. This is the only enchantment that we use against it. After a respite of several years we found a few days ago, one small limb with dead leaves which had every appearance of fire blight; it was burnt; and we presume that one small colony of insects was burnt with it.

Annual Fairs—Intelligence Office.

To the Editors of the New Genesee Farmer—

I observed that by a resolution of the Genesee Agricultural Society, the Executive Committee are directed to cause semi-annual fairs to be held for sale and exchange. Without meaning to discourage, wish to ask a question. The difficulties as well as the advantages of such fairs should be known beforehand. I think every farmer will see at a glance, the benefit to be derived from them, if they could be thoroughly established. But unless they are held in every town instead of one for several counties, will it not cost more than it will come to, to drive animals, ten, twenty, or thirty miles for sale? I fear their worn appearance, after such a drive, would greatly injure the sale. Please dissipate these doubts.

I wish to propose something, which I think would be valuable. This is, a sort of intelligence office, an advertising shop, in every town. Many want to buy, and many want to sell, but they know not where to go to attain their object. I would propose that person be appointed in every town, if practicable, who shall keep a blank book, where any farmer may enter and register briefly the description of animals he may have for sale; in a short time a large assortment would be recorded. A purchaser, by glancing at the book would see in a moment whatever there were for sale, and know where to go. Let such book be kept in central part of the town, and the keeper receive a trifling fee from each person to pay him, and it would be attended with little trouble, little expense, and doubtless prove very useful. Such advertisements should of course be classed—one part of the book being for milch cows, one for oxen, one for horses, another for pigs, &c. &c. J.

Influence of the Moon.

Half a century ago, Algernon Roberts, a distinguished farmer near Philadelphia, in his first minute of the process and results of sowing plaster, regularly noted the moon's age when the application was made but after one year's experience, he says, "As I perceived no difference from the age of the moon when sowed plaster, I discontinued minutely it as *chimerical unworthy of notice*." This was proceeding on the true principles of philosophical induction. At that period, however, the notion of the moon's influence on vegetation was very prevalent, and so inverted that Judge Peters remarks, "Mr. Roberts risked with those who are governed by such *chimeras*, the credit of his other facts." Judge Peters added, "worthy old German told me, in the presence, at much to the education of several of his neighbors who were great believers in the moon, that our elections never went right at the wrong time of the moon!"

Sunflower Seed Oil.

MESSRS. EDITORS—Your correspondent, C., asks what is the best manner of extracting oil from sunflower

ced. Twenty bushels of shrunk, mouldy seed crushed without hulling, at Fairchild & Gage's Mill, in this village, last season. The yield of the seed, with Williams & Purdie's Hydraulic Press, was about 4 quarts to the bushel,—the yield of the seed is nearly 9 quarts, with the same double press. Had the sunflower seed been plump, and in good order, the yield would have been much greater. F. Gage has planted an acre with the above seed this spring.

Waterloo, June 7th, 1840. D. W.

The Slug.

The Editors of the New Geneva Farmer—

I believe some of you have made quite a mistake in regarding the slug the larva of an insect. It belongs to that class in Zoology termed *Molusca*, or molluscous animals, including the oyster, clam, barnacle, &c.; to the order *Nudata*, or molluscous animals destitute of shells, which includes the cuttle fish, sea hare, &c.; and to the genus *Lymax*, or slug. The genus embraces several species, but whether naturalists have described the species which trouble us here, is uncertain.

You also say that there are many species of *Aphis*, also many varieties. That the species are numerous is well known, but I believe they have never been so tainted to run into varieties. J.

From the Journal of the American Silk Society.

Reeling Silk.

The ease with which the operation of reeling silk can be performed is not generally known; indeed it is known to none but those who have tried their hand at it, and many even of them have got out of patience in discovering it. We have heard many anecdotes illustrative of the facility with which persons who never reeled or saw it done. An aged gentleman related to us a few months since, the following: He constructed a Piedmontese reel from the drawing and description in the Silk Journal, and placed it in a room for the purpose of giving it a trial. He had really studied all the directions for the operation, and reeled himself to carry them out literally; after some difficulty he had caught the fibres of as many cocoons as he wished to combine in a thread, had got the two ends passed through the eyes of the plate, and even drew them round each other twenty times, as directed before passing them through the guides of the traversing bar on to the bars of the reel. At last all this was ready. He looked at the cocoons, at the threads, and at all around each other, and at the reel, with doubt and hesitation. "It will not do," said he "surely the threads would around each other in that manner and not pass freely—they must break with a very slight strain of the reel." He at last ventured to touch the reel gently—the thread passed freely, and he was encouraged to turn a little faster, when it passed off all more freely. Thus encouraged, he turned the reel faster and faster, increasing by gentle degrees, till it spun upon full speed; and the faster he turned, the more freely the thread passed, and the more easily the cocoons unwound. He was so delighted with his experiment, that he called in his family to witness his success—for he had made the experiment in private, and he might not be exposed to the laughter of observers in case of failure. He then proceeded, with the aid of one of his family, and reeled a skein of raw silk according to directions, and sent it to a neighboring village where there was a person, a foreigner, who was considered a good judge of raw silk. The silk was shown to him, and he pronounced it *Italian raw silk* of excellent quality, and insisted that the skein exhibited was reeled in Italy, and could not have been reeled in this country. After, however, he was assured that it had been produced here, and he was requested to point out any fault that it might exhibit, he discovered that the thread was occasionally loose. That is, there are spots occasionally, in which the fibres remained united by the adhesion of the gum. No sooner was this fault pointed out than the cause flashed upon the old gentleman's mind instantly. It was this.—During the process the reel had been stopped occasionally for the purpose of replacing exhausted cocoons, and when it was recommenced, he had omitted to draw the fibres below their junction at the crossing.—The fibres at the point had of course not been brought into perfect contact, and had become dry; therefore, when they passed up and through the crossing, they of

course did not remain adherent, and hence the thread in the skein presented those spots of loose or non-adherent fibres—the perfection of raw silk requiring the several fibres to be closely united by their gum into a cylindrical thread. It was a valuable lesson to the old gentleman, although the faulting imperfection his silk presented in this respect, would scarcely have been noticed by the manufacturer; for there is not one skein of the best Italian raw silk in a hundred that is entirely free from this fault.

This anecdote, which is literally true, ought to encourage others to reel silk. The old gentleman is not a mechanic, and yet made the reel with his own hands. This shows how simple the Piedmontese reel is, and how easily it may be made by persons at a distance from places where they are kept for sale.

Another gentleman, who had obtained one of the iron Piedmontese reels that are made in this city, informs us that he is now using it, and that he is surprised at the facility with which the reeler, who never before saw a reel, nor the operation of reeling, perform with it.

Another gentleman, in Pennsylvania, has made a reel himself, of wood, though he is a worker in metal, of a construction different from the Piedmontese, but which produces similar results; with which he is also reeling his cocoons, and has produced some beautiful silk.

We could go on and fill our Journal with similar anecdotes and instances of success in reeling silk, by persons who had never before seen the operation performed. But we deem the above sufficient. We could give our own experience, but this has been done an hundred times. When we learnt to reel, we had not the lights of the present time to guide us. Nearly all the publications on the subject were in French and Italian, which we did not read. But we found in Rees' Cyclopaedia, a description—a very imperfect one, of the Piedmontese reel. We employed a mechanic to make one with variations of our own suggestion.—With this reel we began, encountering all the difficulties without any guide by which we could avoid them; and yet in one week we were able to reel with the utmost facility, and produced as good an article as we have since seen from any country. When the Congress Manual was published, we examined its directions for reeling—compiled, as is well known, from the best European authorities—and we were able to make many important corrections in our own practice—principally relating, however, to speed in reeling.—We therefore, have our own experience as well as that of others for authority for saying, that any person of ordinary capacity and application can learn to reel in one week's time, so as to produce a perfect article.—It will of course require practice to enable them to reel fast, so as to be able to reel as much silk in a day as an experienced reeler can; but it does not require as much even of this as it does for the performance of many kinds of every day work. For example, A young woman can learn to perform a full day's work at reeling silk in half the time it would require to learn to do a full day's work at spinning cotton or flax.

It is a common remark by persons who are going to raise silk, that they intend to sell their cocoons; and one of the most common questions asked of us is—"Will there be a market for cocoons next season?" Nearly every body contemplates selling their cocoons. Now this is wrong. The producer of cocoons should also reel them for many cogent reasons—first, that he may obtain the profits of reeling, which he will find are nearly or quite equal to those of producing the cocoons. The highest price of a bushel of the best cocoons is \$5. This bushel of cocoons if properly reeled, will produce a pound and a half of raw silk of best quality, worth \$6 to \$8 per pound. But suppose it only worth \$5 a pound, there will be \$2 50 for reeling the bushel of cocoons. The reeling will furnish excellent employment for the females of his family, slave or free; or if he have none, or does not choose to employ them thus, for some neighboring female less fortunately situated than himself. Secondly, the reduction of the cost of transportation. Cocoons are very bulky, 25 to 30 pounds filling a barrel. If they are to be transported to any distance, the expense will be very great. They are also liable to accidents in transportation, such as indentation, which ruins them for reeling; putrefaction from confinement in close barrels, boxes, &c. While the expense of transporting the raw silk is comparatively nothing. A barrel of cocoons will be reduced, in weight, to three and three-fourths of a pound; and in bulk to the size of a half gallon measure, or even less; so that the raw silk of one hundred and fifty barrels of cocoons may be packed in a single flour barrel. These are reasons which we should suppose would induce all persons to reel their own cocoons.

But, say many persons indeed, the reeling of silk is too nice and difficult an operation for our blacks to perform—we do not want the trouble of it. We have showed above that it is not so difficult to reel as is imagined. It is to be sure an art, and the perfection of its products requires nicety and some degree of skill; but all of which is easily acquired by any ordinary capacity. It is not the real difficulties of reeling that prevent any one from reeling; but the imaginary ones. Let any one determine that he will reel, and he shall reel, and that too in a time of apprenticeship that will astonish even himself.

There are some rules to be observed in reeling that we may as well lay down here while on the subject.—They are generally found in the books, so mixed up with other matter that they escape attention.

1st. The cocoons of each particular crop should be kept by themselves. Several parcels should not be mixed together; so that the age of all the cocoons of one parcel may be the same; for cocoons of different ages require water of different temperatures.

2d. The first thing in the morning, the reeler must select her cocoons, putting the best in one basket, second best in another, and the balance in a third.

3d. She must have clear rain or river water, and it is best, if it be river water, that it be placed over night to settle its sandy particles.

4th. She must acquire a knowledge of the temperature required by different cocoons, so that she will instantly know whether the water be too hot or too cold. There is no circumstance that causes so much bad silk as a want of this knowledge, or carelessness in applying it. If the water be too hot, the silk comes off in burs or ganglions, and when this is discovered, the cocoons already in the water are injured by the extraction of the gum, and the silk is thereby rendered uneven and knotty. If the water be too cold, the cocoons will rise up to the plate, and the fibres be broken. This is not difficult to learn.

5th. She should always know how long the cocoons have been produced, that is, how old they are; and in what manner they have been cured, whether baked, steamed, or cured in the sun, as all these require water of different temperatures. Very old cocoons require water nearly boiling, while those just produced and not cured requiring a little more than milk-warm. Baked cocoons of whatever age require water nearly boiling, while steamed cocoons require it of a temperature according to their age, and generally a little higher than those cured in the sun.

6th. Of whatever size the thread is to be, she must keep the number of cocoons regularly the same, or as near it as possible. If she is to produce thread of eight to ten fibres, she must begin with ten cocoons to each thread, and keep that number as steadily running as possible. She will not be able to keep the exact number, but she will never be obliged to allow them to vary more than two, so that the thread will be called "eight to ten fibre." This is regular enough for all practical purposes.

7th. After stopping the reel for any purpose, she must wet the thread thoroughly where it crosses, and thence down to the basin, by sprinkling it with hot water from the basin, before she begins again.

8th. She must change the water in the basin as fast as it becomes foul—two or three times a day, when steadily at work.

9th. While the reel is going she must keep her attention steadily upon the cocoons in the basin, so that when one is exhausted or breaks she may have another ready to be added.

10th. The reel must be turned as rapidly as the cocoons will unwind, so that as little gum as possible may be left in the water.

11. The person turning the reel must keep his eye upon the thread between the traversing bar and the bars of the reel, so that he may see and brush off any notes that may appear on it.

12th. Bear in mind that care and skill in reeling will make the silk worth two or three dollars a pound more than that produced by a careless reeler—therefore, that the careful reeler gets one dollar a pound for her industry, and two dollars for carefulness.

G. B. S.

The Silk Culture.—The National Silk Society has offered numerous bounties, varying from \$100 to \$1000 each for the best specimens of raw silk, to be produced during the coming summer. The whole amount of the bounties is \$16,000. The prospect is fair that the silk culture will become a prominent and settled part of our domestic industry, and that the silk either raw or manufactured, will constitute within a few years, a valuable staple of home production.—*Nat. Int.*

The Crops and the Season.

In Western New York and Upper Canada, the appearance of the principal crops gives promise of a most abundant harvest. In this region the wheat crop is considerably earlier than usual, and hopes are entertained that it will, on that account, be less liable to injury from the rust. The straw is not as heavy as last season, but the heads are well formed and in most cases stand thickly. We have not heard of any serious injury from the fly or worm, and our farmers feel quite certain of an abundant wheat harvest, whatever may be the price in market.

In Ohio we believe the fly has done considerable damage to the wheat crop, especially in the lake counties.

In Michigan and Indiana, the wheat crop has sustained great injury in some parts from the Hessian fly and the Army worm. From all accounts, however, we believe the destruction is by no means general, and those states will still yield a large surplus of wheat and flour.

From Pennsylvania, New Jersey, and Virginia, the accounts are also favorable, with very slight exceptions.

Early Premium Vegetables.

Delivered at the Rochester Seed Store since our last.

June 5th—Second peck green Peas. Thomas C. Hance of Macedon. Eagle Tavern.

June 16th—First peck new Potatoes. Chas. Filer of Greece. Eagle Tavern.

June 18th—Second peck new Potatoes. Thos. C. Hance of Macedon. Rochester House

June 25th—First peck String Beans. Wm. Hamilton of Rochester. Eagle.

Education of Farmers' Sons.

We have received several communications on this subject, some of them well written, and others bearing sad evidence of the fact which they deplore, namely the great neglect of education among farmers sons.—The subject is too important to be overlooked; but, at the same time, our friends must bear in mind that practical agriculture is the main object of our paper; and therefore we are compelled to reject many articles which otherwise we should be glad to lay before our readers.

A Large Calf.

Messrs. Editors—I yesterday had a Bull Calf of nine weighed that was just a year old. He has never been fed high, but I have merely kept him growing.—He had the milk of the cow during the summer, and in the winter all the grain he had, was from 4 to 6 quarts of oat meal per day. Since we turned him out this spring to grass, he has had no grain at all. He is principally of the Durham breed, with about one-eighth of the Holland. His color is black, with white flanks, which he takes from the Holland. He weighed 890 pounds.

Have any of our brother farmers raised a heavier one with the same keeping? Yours, truly,

BENJAMIN CHASE.

Shelby, Orleans Co., N. Y., June 20, 1840.

Transplanting Annuals.

Seedlings may be safely transplanted in the hottest and driest weather, by turning over them immediately after they are set out and watered, a flower pot with a hole in the bottom. The hole serves as a chimney to let off the heat; and such plants will be as fresh through the hottest part of the day, as if they had not been removed. Towards evening, when the sun cannot shine on them, take off the pot and give them fresh air till the sun appears in the morning—then replace it. In a few days they will have new roots, and be out of danger.

M. B. BATEHAM will spend most of this month travelling in the Western parts of Upper Canada and New York, where he hopes to have the pleasure of calling on many of his friends.

Lost Numbers.—Post Masters will please inform us if any subscribers have not received their papers correctly, that we may send them again.

OLD GENESEE FARMER.

BOUND Vols., 1st. and 1h, may be had at \$1 per vol. B Swine Breeder, or a treatise on fattening swine. For sale by D. HOYT, May 21. 6, State-st. Rochester.

VOLUMES WANTED.

A high price will be paid for several copies of vols. 3, 5, 6 and 9 of the Weekly Genesee Farmer. M. B. BATEHAM. July 1st, 1840.

PORTABLE THRASHING MACHINES.

CLOVER MACHINES AND HORSE POWERS.

WARRANTED to be thoroughly built and to work well; made by THOMAS D. BURRILL, Geneva, Ontario Co., N. Y.

These machines have all been warranted "to be thoroughly built, and to work well," and they have fully sustained that warranty.

They have gone largely into use, more than four thousand are in operation; many of them have thrashed from ten to twenty thousand bushels each, without repairs. More than eight hundred new machines were sold during the last season; and on thorough trial, they have been recommended by those who use them "to be as complete, and to work as well as any in the world."

This new Combination Machine separates the grain from the straw in the process of thrashing, without any additional machinery; saves the labor of one hand in raking away the straw—much grain which is usually raked off with the straw—and is driven with less power than any other machine in use. Geneva, June 27, 1840.

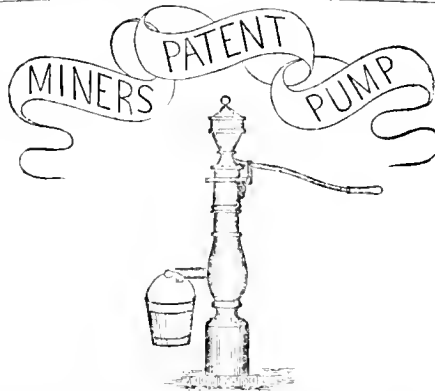

A DURHAM BULL CALF,

OF FINE FORM and undoubted pedigree, for sale at a reasonable price, by THOMAS WRIGHT, Macedon, Wayne co., 5 mo. 17th, 1840. Also as above, some pure Berkshire pigs of the Bement stock.

NEW ARRIVALS!

JUST received at the Rochester Seed Store by the Steam Ship British Queen from England, a large supply of best purple top Ruta Baga, and a general assortment of English and Scotch Turnip Seeds. Merchants supplied at very low prices. M. B. BATEHAM, June 1st, 1840.

MINERS PATENT PUMPS, for Wells and Cisterns, improved. During the last few months the subscribers have made several important improvements in the construction of this pump, which renders it the cheapest and most durable article now in use. They have no hesitation in saying that they are decidedly preferable to any other article now in operation. Many testimonials of scientific and mechanical men might be given to show the simplicity and durability of the construction of this pump, and its superiority to all others, but as a personal examination might give a more correct idea of them, they invite all who may have occasion to purchase, to call before supplying themselves elsewhere.

They are now manufactured and sold wholesale and retail, at prices corresponding with the times, at the Warehouse of the Eagle Furnace, near the Falls, by W. A. LAMWORTHY & Co.

Rochester, April 1

Seed Buckwheat for sale at the Seed Store by M. B. BATEHAM.

NEW BOOKS.

CHILD'S work on Beet Sugar; Buel's Farmers' Companion; the American Swine Breeder's Companion; Bridgman's Gardener, new edition; and a fresh supply of sundry other valuable books, for sale at the Seed Store. M. B. BATEHAM.

June 1st, 1840.

THE THOROUGH BRED HORSE, YOUNG HENRY.

THE PUBLIC are informed that the above thorough bred Horse, raised by H. Woolley, Long Island, and now owned by the subscriber, will stand at O. Culver's, Brighton, Monroe co., and will be let to mares at fifteen dollars the season. Enclosed and good pasture will be provided, and all possible care and attention will be paid to mares brought from a distance and left with the horse; but no responsibility for accidents or escapes, should any occur.

Pedigree.

Young Henry was got by Henry, the competitor of Eclipse, out of Sancho, by Eclipse. Young Henry is now six years old on the 1h of June next: he is a splendid figure, with his points finely developed; he is a dark sorrel, and somewhat over 16 hands high. For further particulars, apply to OLAVER CULVER.

Brighton, Monroe Co., N. Y., May 20, 1840.

IMPROVED BERKSHIRE PIGS.

THE Subscriber has on hand, and will have, during the Summer, Pure Berkshire Pigs—also a cross of the Leicester and Berkshire. These Pigs are equal to any in the State, and will be sold as cheap as any. ROCHESTER, May 1st, 1840. AMOS SAWYER.

AGENTS

FOR THE ROCHESTER SEED STORE

A full assortment of seeds, put up at the Rochester Seed Store, may be found at each of the following places.—Subscriptions will also be received there for the "New Genesee Farmer and Gardener's Journal."

Table listing agents for the Rochester Seed Store across various locations including Buffalo, Lockport, New Fane, Albion, Brockport, Scotsville, Le Roy, Batavia, Attica, Mount Morris, Genesee, Canandaigua, Geneva, Waterloo, Auburn, Palmyra, Newark, Utica, and Oswego, with names of agents like W. & G. Bryant, S. H. Marks & Co., J. P. Lukens, etc.

Rochester Seed-Store, March 1, 1840.

ROCHESTER PRICES CURRENT.

CORRECTED FOR

THE NEW GENESEE FARMER, JULY 2, 1840.

Table of current prices for various commodities: WHEAT, CORN, OATS, BARLEY, RYE, PEAS, BEANS, POTATOES, APPLES, CIDER, FLOUR, SALT, PORK, BEEF, EGGS, BUTTER, CHEESE, LARD, TALLOW, HIDES, SHEEP SKINS, WOOL, PEARL ASHES, POT, HAY, GRASS SEED, CLOVER, FLAX, PLASTER.

☞ *To all whom it may concern*—There is a large amount of money yet due us from Post Masters and Agents, consisting mostly of small sums, but not too small to be needed these times. We hope all who are indebted to us will remit the amount by mail, or otherwise, free of expense, in as current funds as possible, without further delay. If New York or Eastern bills cannot be obtained, Ohio, Illinois, or Upper Canada may be sent. ☞ Where the amount is not even dollars it can be made so by obtaining an additional subscriber. Do you take?

Complaints of inaccuracies or omissions in the mailing of our paper, are often made to us, but in most cases they are found to have been regularly and properly mailed. We have abundant excuse to offer, however, for any delay in attending to letters or sending papers during a few weeks past. Our clerk, J. E. Force, has taken him a wife and left our employ; one of the publishers, E. F. Marshall, has been confined at home by sickness; and the other publisher, M. B. Bateham, has been most of the time travelling. We have got matters righted again, however, and hope to keep them so. Any subscribers who have not received their papers correctly are requested to mention it to their Post Masters and ask them to notify us.

B. & M.

The "Dialogues."—We give our readers a further specimen of the amusing and instructive Dialogues, written by the talented editor of the *Farmers Cabinet*. We learn that they are published in book form, and we wish friend Pedder would tell his publisher to send on a lot to our booksellers; some of our juvenile agriculturists are very anxious to obtain copies.

THE REVOLVING DIAGONAL HARROW.

We give below a description of a Harrow and Roller, which appears to us to be a most efficient and valuable implement of husbandry. On clayey land during dry weather, when the soil breaks up in hard lumps, as is often the case in wheat sowing, such a machine must be of great advantage.

We wish some one of our readers who has seen the operation of this harrow would give us a more particular account of it. The following we copy from the *Farmers' Cabinet*.

REPORT of the Committee on Arts and Sciences, of the Mechanics' Institute, on the Revolving Diagonal Harrow, by Moses G. Cass, Utica, N. Y.

C, C, C, C, are revolving cylinders working in the frame D, by means of gudgeons placed in the ends. Each Cylinder is charged with teeth placed perpendicular to the axis, as seen in the drawing. G, is a tooth-ed wheel intended to break up the ground that would otherwise be passed over untouched; being under the lengthwise rail of the harrow. B, E, F, a moveable frame supporting the rollers A, A, which may be attached to or disconnected from the harrow at pleasure.

An examination of this machine, and a little reflection, will serve to show its superiority to the ordinary harrow. In its passage over the ground the teeth enter the earth in all directions, breaking, removing, or tearing up all slight obstructions; while if it meets with a large stone or any obstacle that would throw the common harrow out, the cylinder, which in this machine encounters the obstruction, is enabled by a whole or partial revolution to pass over it.

An experienced farmer, who has for some time had one of Mr. Cass's harrows in use, remarks that "by attaching the seed sowers and rollers a most perfect finishing operation will be performed, and at a saving of one-half if not three-fourths of the labor commonly required to do the same work."

WILLIAM A. COX, Chairman.

Mechanics Institute, February, 18th, 1840.

The Agricultural Fair at Rochester.

By a notice in another column, it will be seen that the Annual Fair of the Genesee Agricultural Society, is to be held at the same time as the great Fair of the Mechanic's Association. This we think is a good arrangement. The many thousands who witnessed the Mechanic's Exhibition last season, will need no persuasion to induce them to attend again; and the increased and combined attractions which will this year be presented, cannot fail to draw a larger concourse of spectators than ever before assembled on any similar occasion in Western New York.

We hope the farmers of "Old Genesee" will do themselves credit; especially the farmers of Monroe county, on whom the interests of the Fair must mainly depend. They can, if they will, get up an Exhibition which it would puzzle any other section of the Union to equal. What say you, readers, will you try?

Legislative aid to Agriculture.

MESSRS. EDITORS.—I wish some one of your correspondents, who possesses the requisite information, would inform us what has been proposed or done by the Legislature of this State during the two last sessions, for the advancement of agriculture. I should like to know whether we farmers, who constitute the greater part of the community, produce the greater part of the wealth, and pay most of the taxes of this State, are always to be overlooked, and our interests disregarded by our very "humble servants" at Albany, whom we pay fat salaries out of our hard earnings.—Does not the embarrassed condition of our country absolutely demand that something should be done by government to foster and improve the agriculture of this State? Will not the New Genesee Farmer speak out on this subject? Who will suggest the mode by which

the State can best promote the cause of agriculture, without large appropriations?

Rochester.

MONROE.

The Weather, the Crops, and the Harvest.

During the early part of the past month, the spring crops in this section, especially the corn and potatoes, suffered materially from drouth; but the seasonable rains since have apparently quite recovered them, and every thing now looks promising.

The wheat crop is mostly secured, and accounts from all quarters agree that it is more abundant in quantity and better in quality, than it has been for many years past. New wheat begins to appear in our market, and finer samples we have never seen. We have had frequent showers here of late, but have not learned that they have done any injury to the wheat.

☞ Canadian Agents. ☞

We find it necessary to repeat the notice that D. SMART, Esq., Post Master at Port Hope, is general Agent for us, and we wish other Post Masters who remit to us by mail would do so through him, and thereby save us the American postage.

Mr. J. W. Brent, of Toronto; and Mr. Chas. Heata and Mr. John Creighton of Kingston are local agents; to whom payments or communications for us may be made.

☞ All Post Masters are requested to act as local agents.

To Correspondents.—Several valuable communications received rather late are unavoidably crowded out in order to make room for the affairs of the agricultural society. They will not spoil by keeping a month.

Cherries.

We lately took a journey of two hundred and fifty miles through the Western part of this State, in a private carriage, having good opportunities for observation;—and only in one place after leaving home, have we seen good cherries. There we found two or three sorts that were pleasant, but hardly *fine*.*

We make these remarks to show how little the most of our farmers know about good fruit. At many home-steads we saw either no cherries at all, or the common sour pie-cherry, with some seedlings of the small heart cherry in a few places; but only one grafted branch. So little indeed is seen of the better sorts, that a very intelligent friend of ours in the West, had arrived at the conclusion that this climate was unfavorable to their growth and maturity! Now if we have spied out the nakedness of the land, it may be right and proper to tell our negligent countrymen, how they may *clothe* their premises, and eat fine cherries, *as we do*, for six weeks at least in constant succession.

We have always found, in making collections of any kind, that a proper *place of deposit* was of great importance. Enclose therefore a fruit garden, in any manner that may seem best, and of any size from half an acre to two acres or more.—Not all for cherries?—No; but whoever has a taste for fine fruit, will want peaches and plums, and pears and apricots; and not one tree only, because the sort may be "good enough," but kinds sufficient to follow one another in succession during the longest season of that particular fruit.—We have no notion of feasting one week and fasting the next.—Our trees were originally planted twenty feet apart, and at this distance there will be room enough for a long time to come.

We have at this time about twenty kinds of cherry trees in all; and ought to have had many more, but other trees were sent from the nurseries, instead of the kinds we paid for. For instance, the American Heart, the Amber Heart, the Oxheart, the White Bignean, and the Downton, came not; but in their stead several sorts which we had already in possession. This treatment was highly improper and abusive, but mistakes may sometimes creep in, even where great care is taken, and fair dealing intended.

The earliest, cultivated either in this country or Europe, is the *May Cherry*, which is small in both fruit and branch. We presume it might be grafted on the dwarf Siberian, and then it would stand as a mate for the currant bush. We have had them ripe in the latter part of the fifth month.

The *Early Richmond* begins to ripen in immediate succession. It fills the space between the *May Cherry* and the common *Pie Cherry*, both in regard to size and the time of maturing its fruit, which though sour at first, becomes very pleasant when fully ripe. It is valuable, and may hang on the tree for several weeks.

Four other cherries in our fruit garden ripen at the same time with the *Early Richmond*. The first sort is also a round cherry, of good size, sweet for one of its class, and decidedly a favorite. It came under a wrong name; and we do not find it agree with any description in Lindley or Prince. It will scarcely be the less prized, however, on this account.

The next is *Knights Early Black*, which came from one of the Flushing nurseries marked "Black Tartarian." We hardly regret the mistake. Indeed the editor of the *Pomological Magazine* says that if he were called upon to state specifically the difference between them, he would be unable to do so. He adds however, "It has the rare merit of ripening earlier: on a south aspect it will be ripe even earlier than the *May*

Duke."† It is so with ours where the trees stand together. We have had some of these cherries from young thrifty trees that measured an inch or more in diameter.

The *White Tartarian*, like the last, is a heart cherry; and when fully ripe there is none better. We have a young tree marked the *White Hartfordshire*, which differs in its growth but not in its fruit; and when a few of each sort were exhibited, we were unable to detect the difference.

The *Black Caroon* is also a heart cherry, of good size, and a fine fruit. It receives a full share of attention from visitors. At Aurora and its neighborhood, it has been called the *Albany Cherry*; but it would be well to lay this name aside.

While these sorts are growing thin on the branches, the *Transparent Gaigne*, is swelling and softening as well as the later crop of the *May Duke*; and both are highly valued. One of the round class, marked "*Waterloo*," keeps time with them, and the fruit is decidedly fine; but we cannot distinguish in it Lindley's characteristics of *Knights Waterloo* with certainty, and we must wait for more light.

The *Carnation* is later than the preceding sorts.—It is a moderate bearer, and in rainy weather is apt to decay on the tree; but it is very palatable, those who have never seen it ripe to the contrary notwithstanding. It appears to do better where it receives the reflected heat from a building. The brief but timely showers of the present season have not injured it; and in a drier climate, this tendency to decay would be no objection.

The *Common Pie Cherry*, (Kentish?) and the *Morrello*, are valuable fruits, and ought to be more cultivated than they are; but they are too sour for the table, uncooked. These sorts grow freely from suckers, and are generally within the reach of every one who wishes to have them.

The *Cream Cherry* originated in or near the South part of Seneca county, and promises to be valuable. It takes the name from its color; which however, is sometimes tinged with red. It is the latest of our cherries, medial size, heart shaped, and sweet. We want to see it on a stock exclusively its own, and then we can form a better judgement of its merits.

One remark more. Ten trees of the finest sorts of cherries can be had for five dollars. The interest on this sum is thirty-five cents a year. Who would not be willing to pay it annually for such a treat?—for cherries come annually without fail. †

† We think however, that pomologists err in referring to the *May Duke's* time of ripening: It ripens in patches, and some may be used when the cherries on the other parts of the tree are not colored, showing a difference of several weeks.

The Canada Thistle.

This weed has so much increased in some parts of Cayuga county, that it may be found in almost every lot and field. Among crops where the hoe is introduced, as corn and potatoes, it stands but little chance; but among such as are sown broad-cast, it is a great pest; and every advantage that can be taken of it, ought to be known. We wish to contribute our mite. Oats when sown early in the spring, will not send up stalks as soon as this weed; and there is a time when the latter may be mown without injuring the crop.—The scythe, if not very sharp, will glance over the grain, but cut the stiffer stems of the thistles. This operation gives them an effectual check for that season, and the oats may be harvested with very little inconvenience.

We would recommend this practice however, only where there are but few patches of thistles in the field; and not where it is much over-run with them. In the latter case, the land should not be sown with wheat, oats, or barley; but either planted with some horse-

hoeing crop, or turned into a regular fallow,—not to be ploughed only two or three times, but as often as once a month throughout the season, and then in the most thorough manner, so as to leave no shoot uncut. The farmer who undertakes this business, must prepare himself accordingly. He must make his calculations before-hand, and nerve himself for the contest. No half-way measures will answer. To plough them once in the spring, cultivates them; and to plough them twice, is but a check; but every subsequent encounter destroys a portion of their vital energy.—The next season cultivate the ground well in corn, potatoes, field beets, or swedish turnips, and it will give them the finishing stroke.

To pull up the stalks of this thistle, weakens the horizontal root much more than to hoe them; and we have used wooden tongs for this purpose, nearly shaped like the blacksmith's. If the holes left by the stalks, be then filled with brine, very few if any new shoots will appear. †

From the Southern Cabinet.

Notes on European Agriculture.

BY AN AMERICAN.

WHEAT.—In my last I gave some notes on the rotation of crops in Great Britain,—a judicious mode of culture, which is now adapted to a considerable extent in Sweden, Denmark, and the grain growing countries in the north of Europe. Thus, the soil, although it does not annually give the same kind of product to the cultivator, is never idle, but produces in succession crops which are often more valuable than wheat itself.

As however wheat is not only one of the staple articles of Europe, but also of our own country, I propose to devote this article to a description of the method of culture.

1st. PREPARATION OF THE SOIL. The wheat crop, as I have stated in a former chapter, usually succeeds the fallow crop, which consisted of potatoes, beans, or turnips. This fallow crop is richly manured. Stable manure is in a majority of instances used, and in most soils is preferred. It is spread on the fields broad cast in the proportion of twenty or twenty-five tons to the acre. In about half the cases it is scattered over the fields in the early part of winter, and ploughed under in December. Where time is wanting the manure is not applied till early in the spring, which I am informed, answers equally well. Lime is much used on light sandy soils. In some parts of the coast of Holland, where the soil is poor and sandy, the application of lime has given a dark, rich color to the earth, which now retains its moisture and produces abundant crops. On the sandy lands between Berlin and Dresden resembling our Carolina pine-barrens, I noticed it used in some fields with very beneficial effects. Similar results have been produced in New Jersey by the application of lime on bare sandy soil. Bone dust is much used in England on light soils. It is generally procured from the continent. A few mills for the purpose of grinding the bone for manure exist in England and Scotland, although they did not fall under my notice. A model of one exists in the agricultural museum of Edinburgh, which was politely exhibited to me by Professor Lowe. The construction is very simple; but as I believe it is well understood in the United States, and as I am not much of a mechanic, I need not venture on a description. The bone dust is used in the proportion to twenty-five bushels to the acre; a greater quantity has not been attended with any increased beneficial results. It is sown broad cast on the land; sometimes mixed with turnip seed. Night soils, (a very valuable manure,) are limited to the neighborhoods of towns, and principally applied to gardens.—This article is prepared in the vicinity of Paris by a method rendering it not in the least offensive. It has the appearance of large dried bricks, which are broken up when wanted, and applied to the land in the manner of bone dust.

When the fallow crop has been removed, the ground is ploughed and put in order for the reception of wheat; occasionally some manure is added, but it is in general believed that the ground is sufficiently enriched for the ensuing crop. The ploughing is similar to that of our own country. The wheat is sown from the middle to the end of October, generally in drills, but sometimes broad cast. The sowing or drilling of the wheat does not complete the labor till the time of harvest, as is the case in America. The wheat is regularly hoed between the drills two or three times, and when the

* In the principal villages doubtless, some excellent sorts are cultivated. We speak of only what we saw.

wheat is about a foot in height, it is carefully weeded, hence, we seldom find in English wheat either cockle, cheat, or the seeds of the various weeds which which our fields are so often infested. The wheat is usually gathered with the sickle. I saw no cradles, like those of America, in use.

2nd. QUANTITY OF SEED TO THE ACRE. In this particular I found a great difference of opinion between the British and American farmer. In this country a bushel of wheat is considered sufficient for an acre; formerly many persons only used three pecks per acre. I am inclined to think, that we have erred in using too little seed. I remember visiting the fields of a farmer in New York many years ago, and observed that whilst the heads of wheat were very fine, the stalks appeared to stand thinly on the ground. He had sown three pecks to the acre, and the produce was nine bushels. I suggested to him the propriety of using a double quantity of seed. Three years afterwards he sowed the same field again, using a bushel and a half to the acre,—the season and tillage were similar to that of the former sowing. He subsequently informed me that his land this year produced fifteen bushels to the acre, and that he was now an advocate for thick sowing.

I extract from my notes on English husbandry the following quotation, which I either wrote down from the dictation of some responsible agriculturist, or copied from some agricultural journal of England: I am inclined to think the latter. I have reason to believe it is the usual mode adopted in England and Scotland.

"On rich lands in good condition, when the soil is strong loam or clay, and well drained, two and a half to two and three-quarter bushels per imperial acre may be sufficient, of the ordinary varieties. As spring sown wheat does not tiller well, one half to three-quarters of a bushel more may be necessary; but strong clays are not well adapted to spring sown wheat, although it is quite possible that a suitable variety may be obtained for that purpose.

"On medium soils one half bushel more may be requisite for such season of sowing, regulating the quantity to the quality and condition of the soil, and the preceding crops. When potatoes have been raised in the fallow division, at least two or three pecks more may be necessary than after a clean fallow.

"On high and light lands, wheat after fallow should be drilled in from two to three inches deep, to prevent throwing out in spring. With this precaution, if the land is in good condition, little more seed will be wanted than on medium; but on such lands wheat holds best after grass, and in that case requires two or three pecks more seed than under any other circumstance."

As I have never seen the stalks of wheat so thickly crowded together in my own country as in Great Britain, and as their average crop is decidedly greater than ours, I have accounted for the difference, at least in some measure to the greater quantity of seed used by the European agriculturists, after making due allowances for the differences of climate and modes of culture. I remarked that in England, in consequence of this thick sowing, there was but one stalk to each grain, whilst in America, where the seeds were farther separated, there are usually side stalks, few of which produce equally well with the one proceeding from the grain. The additional quantity of the seed sown is doubly compensated for, by the greater product to the acre. These, however, should be matters of experiment with us, in a climate where our summers are much warmer, as I am fully aware lands may be too thickly as well as too thinly sown.

3d. VARIETIES OF WHEAT IN EUROPE.—Botanists have been much perplexed in endeavoring to decide on the true origin of our varieties of wheat. It is now difficult to ascertain what is the true *tritium sativum* or common wheat, and the latter *tritium aestivum* or summer wheat. I am, however, inclined to think, that all the varieties may be included under one species, as there are no distinctive marks by which they can be separated. Under *tritium hybridum*, for instance, are included some of the earliest and best varieties of spring wheat, and under *tritium aestivum* are included several bearded wheats, equally hardy, and requiring as long time to arrive at maturity as our common winter sorts. Indeed, the French Botanists have now referred all the varieties to *tritium sativum*. But this is not the place to settle nice botanical distinctions.

Spring wheat is seldom cultivated in England as a general crop. In every instance where I saw it growing, it appeared to me rather inferior.

In my last number I alluded to some of the varieties of wheat at present cultivated in England. The golden drop, blood red, Usbridge, Hunters, Mengoswells, Whittington and Beckings. The three latter,

like our okra cotton and rohan potatoe, have been so recently introduced that they have not yet found their way into general cultivation. The specimens which I saw, however, were very superior, sufficiently so to encourage the American farmer to import the seed, which may be ordered from Lawson and Sons, Edinburgh, or Loddige in London, or through any merchant in Liverpool. An order sent in July will be in sufficient time to enable the farmer to plant the seed in autumn.

The wheat called Leghorn, or Tuscany wheat, was introduced into England for the purpose of procuring straw for the manufacture of bonnets, &c.; but it was found not to succeed as well as the common rye, which is now exclusively cultivated in the Orkney islands and the North of Scotland for that purpose.

In the Northern parts of France, I saw cultivated pretty extensively, very hardy variety of wheat called *Poulard bleu*, and *ble, bleu conique*. It is partial to rich clay soils; its grains are dark and very hard.—An Egyptian wheat called *Ble de Smyrna*, was also highly spoken of. There is a variety of wheat brought originally from Morocco that is successfully cultivated in Italy, but does not succeed well in the northern parts of Europe, that might be experimented on in our southern States. Its spikes are long, loose, nodding to a side, and awned; grains about half an inch in length—reddish, transparent, and very hard. It usually goes under the name of Polish wheat, although it is not much cultivated in Poland,—is said to have come originally from Morocco, and is often called Mogadore wheat.

I find in my journal, descriptions of nearly one hundred varieties of wheat in Europe, but doubt whether the transferring them to your pages would be of any material benefit to the American farmer, who, I fear, would scarcely import them even as an experiment. Should the seeds which I brought with me and distributed through several parts of our southern country, be successfully cultivated, I will endeavor to notice them on some future occasion.

It would be of great advantage were our agricultural societies to imitate the examples of those of Europe, in attaching a museum to their institutions, where not only the different grains cultivated might be exhibited, but also the stalks and plants preserved in a dried state,—the mode of culture and product carefully noted for the benefit of agriculturists. I observed at Washington, during the last summer, a successful attempt of this kind by the intelligent superintendent of the patent office.

The English farmer has more to apprehend from the constant drizzling rains during harvest time, than from insects, which are the bane of the American farmer. The so called Hessian fly, has never been introduced, and the poor Hessian has sense enough to answer for on another score, without meriting the charge of conveying this pest to America in his straw. The insect is not known in Hussia, and although two specimens were shown to me as having been procured in Sweden, they proved to be of a different and harmless species. I fear we will have to claim it along with the opossum and rattle-snake, as exclusively American. The wheat of our country also suffers materially from other insects, which prey upon it in its ripened state; hence, in many parts it is necessary that the crops be not only thrashed out, but immediately carried to the flour-mill. In England, on the contrary, I perceived stacks of wheat that had remained unthrashed for three and four years, and in many instances five or six, without any molestation than that of the Norway rat—that cosmopolite, gregarious, omnivorous pest of all countries.

There are two of the sciences, however, widely removed from each other, and however seldom thought of by the American farmer, that have long appeared to me as inviting greater attention in an agricultural point of view than has hitherto been devoted to it. I mean chemistry and entomology. The former enabling us to analyze our soils, and directing us to the best modes for their improvement, and the latter pointing out to us the habits and character of those insects that prey upon our fruits and grains, without which we cannot find a remedy against their depredations.

Growth of Potatoes.

A correspondent of the Inverness Courier mentions a mode of growing potatoes, which may be useful in the saving of seed in seasons of scarcity, and also of furnishing a supply a month earlier than the usual period. The experiment described consisted in planting the shoots thrown out from potatoes kept in the cellar, on the 30th of May, about a month later than the usual period of sowing. They were planted in a garden and raised on the 19th of September, and the result

was highly satisfactory. At one stalk there were nine potatoes the size of eggs; at another two large ones, one of them weighing 1 lb. 2 oz. The cultivator is of opinion, that had the shoots been planted a month earlier, there would have been an excellent and early crop. The shoots should be about ten or twelve inches in length, and dibbled into prepared ground, and all covered except the two small leaves at the top.—None of the potatoe should be planted along with the shoot; but they are the better to have a good many fibres thrown out from the root end of the shoot.—*English paper.*

From Childs' Work on Beet and Beet Sugar.

Culture of the Beet.

SPECIES AND VARIETIES OF THE BEET.

The following are the principal ones cultivated in France.

1. *Mangel Wurzel* or *Scarcity Root*. It has large, thick, succulent leaves; the root is white within and without; grows much out of the ground, and attains a size superior to all other species. Many cultivators have remarked that though it is good for fattening cattle, it is not equally favorable to the production of milk.

The variety cultivated in England has a reddish or whitish red root. It is not much valued for domestic use, although the leaves are good to boil as spinach, and the leaf-stalks and midrib to stew and eat as asparagus. Dr. Lettsom states that on his land, which was propitious to its growth, it weighed, on an average, full ten pounds, and the leaves half as much, so that the whole produce was fifteen pounds of nutritious aliment to every square of eighteen inches.

2. *Red or Blood Beet*. It has a long red, eatable root, and darkish red or purple leaves. Sown at suitable distances, much greater of course than are ordinarily allowed it in our gardens, it becomes nearly as productive as the sugar beet. The larger the roots grow, the tenderer they are, and the deeper their color, the more they are esteemed.

The varieties of these species are the common red beet, the early turnip-rooted beet, the green-leaved red beet, and the yellow-rooted red beet.

3. *Yellow Beet*. It has yellow, or greenish yellow leaves and yellow roots, which are frequently very long and large. It has been cultivated for making sugar, but most manufacturers have discarded it, finding that its juice, though next in richness to that of the sugar beet, contained from one-eighth to one-quarter less saccharine matter, than the latter. It is prone to degenerate. A field sown with genuine seed will sometimes yield a fifth, sixth, or greater part, with a coat of a rose color and flesh white, or coat yellow and flesh white. A single seed will occasionally produce three yellow beets, and one rose colored; though what is commonly called one seed, does in fact contain from one to five seeds.

4. *White Silesian or Sugar Beet*. It has pale green leaves, the root pear-shaped, and shorter than the other species. It grows entirely within the ground, except it meet with some obstruction, in which case the exposed part becomes green and loses a portion of its sugar.

There is one variety of this species, the red-vein-leaved, with rose-colored rings in the flesh. This is considered a degeneracy.

In Germany, besides the yellow and sugar beets, they cultivate principally the following, which appear to be varieties of the *mangel wurzel*, or as it is sometimes called, the *great German beet*.

1. *Red and White*. It is usually red and white within and without. This beet grows seventeen or eighteen inches long, of which one foot is above ground; and it sometimes weighs twenty-five pounds. Its juice is very watery, and in proportion to its size it contains the least nutritive substance.

2. *Yellow and White*. It grows half out of the ground. It is rather small and less woody and aqueous, keeps better and is more nutritive than the preceding. It sometimes weighs twenty pounds.

3. *Pale red*. It penetrates the earth more than the others, and weighs as much as sixteen pounds.

There is no limit to the varieties of the beet. They may increase like the crosses of sheep. This will always be the case; if different sorts for seed are not set at a good distance apart. Soil and climate have sometimes the same effect. Some fields will produce only the red-vein leaved, although none but the seed of the pure white Silesian was sown.

It is supposed by some that the wild sea beet, so called, is the parent of all our cultivated beets. It is a native of Holland and Great Britain, on the sea coast and salt marshes. It is found about Nottingham, in England. The first beet planted in France,

was, however, a native of the southern and maritime regions of Europe, and was brought from Italy. The Romans were acquainted with the white beet, which they called *ciela*, *sienu* or Sicilian.

UPPER CANADA.

Having completed our rambles in Upper Canada, we might offer some detailed remarks on the agriculture of that province; but we are happy to say the task has fallen into able hands than ours. It is highly gratifying to find occasionally such men as the Hon. ADAM FERGUSON, who at times can stand in the halls of Parliament and grapple with giant intellects in discussing the affairs of government, and then return to the quiet farm and find scope for their powerful minds, in elucidating the science and practice of agriculture.

It was about noon, one warm day in July, while journeying from Toronto to Hamilton, on horseback, that we turned aside from the main road, to find the residence of Mr. Ferguson. We found the house, beautifully situated on the side of a hill, overlooking the broad Lake Ontario in one direction, and in another the Bay of Burlington, with the pleasant village of Hamilton backed by green hills in the distance. Near the house is a fine expanse of fields and meadows, in which we found some of the best and most perfect animals of farm stock we have ever seen. Mr. F. is an experienced amateur of fine cattle, and has imported quite a number of splendid animals, one of which ("SIR WALTER,") is now owned by Mr. McKnight, of this city. He has another, similar to it, which he now offers for sale.

We shall not soon forget the pleasant afternoon which we spent at Mr. Ferguson's, and the hospitality of his accomplished lady will long be fresh in our recollections.

Agriculture of Upper Canada.

(BY THE HON. ADAM FERGUSON.)

WOODHILL, Upper Canada, }
July 20th, 1840. }

MR. BATHAM :

SIR—When I had the pleasure of a visit from you, (shorter, certainly, than I could have desired,) you expressed a wish that I should give you some of my notions on Canadian farming.

Conscious of my inability to do justice to the subject, I am yet willing to make the attempt, principally, if not solely, actuated by a desire to see American and Canadian farmers unite in promoting the most important temporal concern in which *man* can be engaged, viz: the cultivation of the soil, and improvement of our breeds, and management of domesticated animals. I have all my life been zealously attached to rural pursuits, and with all its vexations I believe no line of life is better calculated to ensure happiness, health and independence, than that of the husbandman.

"*O fortunati Agricola sera si bona norint.*"

Canadian farming, to be fairly estimated, must be considered the rude efforts of manufacturing labor, expended upon a mass of raw material, valuable in itself, but requiring both capital and time to perfect.

The Upper Province, or I may say, the upper portion of the province of Canada, to which these crude remarks are chiefly intended to apply, is a country eminently designed by Nature for Agricultural enterprise. The soil and climate, the vast means of internal navigation, the choice of markets, all clearly indicate her as the Farmer's Home. Her sons, *natives* or *adopted*, must not indeed indulge in sloth, or in golden dreams of wealth, rapidly amassed, but they may count upon a fair return, for diligence and labor, with the satisfaction of spending rational and happy lives, possessed of every rational comfort and true enjoyment.

To form, as I have said, a fair estimate of the skill and proficiency of our farmers, due allowance must be

made for the complicated difficulties which the early settlers were compelled to encounter, and which they have in so large a measure effectually overcome. It would be most preposterous to look for nice attention to the minute details of farm management, from men struggling for a bare subsistence, and who could command no other aid save the inmates of their *shanty* or log hut. In this our day, it is scarce possible to conceive the harassing privations and obstacles which they have to encounter, in the want of roads, distance of mills, and merchants, with many a sad *et cetera*, now hardly felt in the most remote sections of the Province.

Years have rolled away, great changes in the frame of society have occurred in Europe, and hosts of well educated individuals, possessed of capital and skill, have chosen Canada as a home. A new era has arrived, and vast improvements may reasonably be anticipated, should *Old Settlers* and *New Comers*, cordially and honestly concur in giving and taking counsel together. If the one party is possessed of superior knowledge or skill, the other enjoys the no less valuable fruits of experience, with a useful training in the school of *make shift*. Each may do a world of good to himself and to his neighbor, by evincing a sincere willingness to learn, a frank desire to communicate, and a firm resolution to shake off the trammels of prejudice, whether *native* or *imported*.

A fair test of rural improvements has been correctly deduced, from the attention paid to facilitate intercourse, by good roads. In tracing the progress of Scotland to that distinguished station which she is acknowledged to occupy in the history of Agriculture, we find that the value of good roads began to be appreciated just as a better system of cultivation commenced. Whether this may be strictly attributed to *cause* or *effect*, matters little. The fact remains incontrovertible, that good farming and an amendment of roads have invariably gone hand in hand. Sixty years ago wheel carriages were nearly unknown in some of the richest districts of Scotland, and grain was conveyed to mill and market on horses backs, through roads well entitled to vie with the worst mud-holes of Canada. Tried by this test, the agriculture of our Province may well be stated as in its infancy, but we have already a glimpse of better days, and ere long, it is more than probable, that a decided change will take place in our system of road making. In the early days of a new country, personal service upon the roads is the most convenient, and in fact, the only system that can be pursued; and while the population continues sparse, and every man works near his own farm, it will suffice and will go on smoothly enough. In time, however, a more extended scale is required, as business and general intercourse increases. Farmers begin to grumble as their road duty is raised, unwilling to calculate, or to admit, that the increased scale of road making is to benefit them. In this way, road service is too often performed with a grudge, and in a slovenly manner, and we have even heard of an instance, where on a hot day the party actually sent for a *barrel of beer* and a *fiddler* to animate their spirits, with what advantage to the road may be easily imagined.

Under these circumstances, it is earnestly to be hoped, that a pecuniary commutation for labor will be made *compulsory* in place of being merely *optional*, as at present. There can be no question that both the roads and the public will profit by the change.

If the law warranted the exaction of money for road service, upon a reasonable scale of conversion, and if it became a real burden upon the land, then might townships, or individuals, interested in the formation or repair of any line of road, be in safety, by receiving an adequate assignment of the road fund, to advance,

or to borrow the money required, *at once*, and thus complete in *one season*, and in a far superior style, a useful public work, which must at present drag heavily on through many years, each revolving one finding enough to do, in repairing the damage of the preceding season, the main work continuing almost at a stand. But it is more than time to leave the roads and attend to the fields, and even there I find that it will be well to restrict my remarks to some of those points where improvement is most palpably required. It would occupy a volume to discuss *rotations of crops*, *drainings*, *farm buildings*, and *implements*, *varieties of seeds*, *grasses*, &c. &c. and in confining myself to *live stock*, I am satisfied that I pitch upon a branch of rural economy, where all who know Canada, and understand the subject, must admit that ample room for improvement is to be found.

Live Stock.

If required to report upon the cattle of Upper Canada, and to assign them a place with any recognized variety of the ox, the most experienced breeder would find himself woefully at fault. Affinity, may, no doubt, be often traced to North Devons, Herefords, or Sussex, and to the Alderney or Norman breeds, but nothing definite will be met with, and it is therefore an object of paramount importance to procure a more permanent variety of stock, likely to maintain its *identity*, and suited to the wants of the Province. It is not to be supposed, in making this attempt, that Canadian farmers will at once admit the superiority of any new breed. Time must be allowed for dispelling prejudice, and converts obtained by *unobtrusive* but *decisive* examples.

We shall assume that no impartial and competent judge will hesitate to admit the decided superiority of these breeds, which have for many years been the anxious subject of improvement in Britain.

Of cattle used in draught, the two most in repute are *Herefords* and *Devons*, the former large and heavy, the latter of smaller size, and more agile form.—For farm labor, or forest work, no fitter breeds could be found, but it may be reasonably doubted whether the stock amongst us may not provide the farmer with sufficiently useful animals for such purposes, without incurring the expense and hazard of importing bulls from Hereford or Devon. Such, however, is not the case in relation to the Dairy, or the raising the *greatest possible weight of superior beef within the shortest possible period, and at the least cost, for food*.

Early maturity, and a tendency to lay flesh and fat upon the *valuable points*, (a quality perfectly understood and duly appreciated by intelligent butchers,) are distinguishing characteristics of well bred and symmetrical animals, and in no existing breed have these been so steadily maintained, or so distinctly developed, as in the *Improved Short-horn* or *Durham Breed*, and the introduction of *thorough bred* Bulls of this description will decidedly prove the simplest and most effectual mode of improving our stock for every purpose. As Improved Short-horns are yet strangers in our land, a slight sketch of their history and claims may not be altogether out of place.

The counties of York and Durham were the original sources of this valuable breed, and the banks of the Tees furnished the stock upon which improvement was grafted. Much has been written and spoken, and great has been the speculation and alteration upon their early history and progress. A degree of mystery continues, and will probably even obscure the steps of their advancement. Great secrecy was maintained by the Messrs. Colling and other early breeders, and little more is known than the exercise of exquisite skill, patience and attention in selecting animals of promise, one excelling in one point, and another in

another, with a tolerably shrewd guess, that hardy and thrifty Galloway and Kyloes had occasionally been made to contribute their mite. Be the course pursued, however, what it may, it was chosen with judgment, followed out with the greatest steadiness of purpose, and has been crowned with complete success. There is at this day, no breed of domesticated cattle in the world, which can compete for a quick return with improved Short-horn, always promising that there exists a market for good beef, and that the stock receives ordinary care and attention.

It is a regular occurrence in the markets of Darlington and Morpeth, to find thorough fat steers sold at twenty-seven to thirty months old, which weigh *seven or eight cwt. sinking offal*, and with which no means have been used beyond the common run of the farm. It is a great mistake which many adopt, when they denominate these cattle a delicate race. They require in ordinary management, no extraordinary pampering in care, although disappointment both in size and form must inevitably ensue, if abandoned and neglected, as we see too many unhappy animals around us.—It is likewise a common, though equally unfounded assertion that Improved Short-horns are defective as milkers. Many decisive instances of deep milkers might be adduced, but it is quite sufficient to state, that the great dairies of London, frequently containing 800 or 1000 cows each, are supplied by the Yorkshire and Durham breeders. No doubt, among *very high bred* Short-horns, cows are occasionally met with, whose milk scarce suffices to rear their calves, and whose tendency to obesity is such that it is extremely difficult to procure from them a calf at all. But it is equally true, that in numerous instances, cows of this breed yield extremely well to the pail. The great secret consists in keeping steadily in view the tendency of *Improved Short-horns to early maturity* and the important quality of repaying well for food consumed, *either in beef or dairy produce*. The judicious breeder will take his line. If milk be his object, he will have an eye upon those cows who yield well, and *continues long in milk*, for be it remembered, that it is not the cow with the greatest flush of milk, for a few weeks after calving, which will pay the farmer best, but the animal who continues to yield a fair supply *during the longest period of gestation*. Should the quick production of beef be the *desideratum*, attention will be paid to those animals who exhibit a tendency to lay what they consume upon their ribs. It has been doubted by very intelligent men, whether *decided* milking qualities, can be with certainty transmitted in any breed. Whether this opinion be correct or not, there is no manner of doubt, that *well bred* Short-horns are blessed with an *inherent* quality, which will repay the breeder in no ordinary measure for food consumed, just as he may incline, to direct his attention to the dairy or to the shambles.

The Ayrshire cattle have in Scotland, acquired a high and deserved celebrity as Dairy Stock. It must be kept in remembrance, however, that the climate and soil of Ayrshire, rendered the dairy a prominent feature in the husbandry of that county. Without any disparagement of Ayrshire stock, I must be permitted to give the preference to *Improved Short-horns*, for Canada. In fact, I verily believe them to spring from a common origin, and although it may be impossible to ascertain the period of migration, there are strong grounds for connecting them with the primitive stock, upon the banks of the Tees. In confirmation of this theory, it may be stated, that *pure* Ayrshire cattle were in high favor with the Duke of Montrose, and received from him more than ordinary attention and favor.—The gradual effect of this care was a distinct approximation to the original breed of large-boned, coarse

Short-horns. At a great Cattle Show of the Highland and Agricultural Society of Scotland, held a few years ago in Glasgow, an Ox (5 years old I think,) was exhibited by His Grace, which weighed when slaughtered, 1552 imperial pounds, with 180 lbs. of tallow, *sinking offal*, a heavy, but coarse brute.

The Dairy is a delightful and profitable branch of husbandry, making good returns, and *particularly useful in Canada*, as demonstrating to every judicious farmer, the urgency of securing the aid of a fit helpmate, without whose activity and superintendence all will go wrong. In dairy management, success will invariably, and *only* attend cleanliness, *scrupulous and minute* in all the details. Dairy management in Scotland has been much encouraged by the Highland and Agricultural Society. The county of Aberdeen was distinguished for the large quantity and *inferior* quality of the butter produced. By a change of system and superior attention to cleanliness, the butter of Aberdeenshire quickly rose in the scale, to an equality with the best Irish, and it may perhaps be acceptable to state the mode recommended, and successfully adopted by dairy farmers of that extensive county.

We are compelled to omit the remainder till next month.—Eds.

To the Directors of Agricultural Societies in Upper Canada.

Our sincere acknowledgments are due for the flattering encouragement which this paper has received from the friends of Agriculture in Upper Canada; and in order that our labors may exert a more general and effectual influence for the improvement of that Province, we wish to make one or two suggestions for the consideration of the Agricultural Societies.

From much observation and inquiry made during a late tour in that country, we are convinced, that with the liberal aid which is rendered by government, much more can easily be done for the advancement of Agriculture in that rich province than is done at present.—The principal difficulty which exists is a want of a proper *stimulus for the mind*. The farmers do not rightly estimate the advantages which they possess; or appreciate the dignity and importance of their profession.—Their minds are not sufficiently interested in their calling, and therefore it is obvious that the first thing to be done, should be *to persuade them to read on the subject*. Let them be often informed what other farmers, and other societies have done, and are now doing in their own and other countries, and they will not long feel indifferent on the subject of improvement, or be contented with present attainments. An active spirit of emulation and enterprize will soon be excited, which will effect a most salutary change in the character of their agriculture, and impart new life to their societies. We are convinced from observation and experience, that no Agricultural Societies can long be sustained with much spirit and usefulness, unless the members generally are readers of some spirited agricultural periodical; and nothing at so little expense would do as much for the improvement of Upper Canada as the general circulation of a paper, containing interesting intelligence and valuable essays on improved husbandry. It is admitted that such a paper cannot be published in that country now with much chance of success, and therefore, at the suggestion of some warm friends of the cause, we make the following proposition:—If the Directors of the Agricultural Societies will make arrangements to place the *New Genesee Farmer* in the hands of each of their members, we will devote a portion of the paper to Canadian intelligence, and make arrangements with the Presidents or Secretaries of the different Societies to send us important and interesting intelligence; and also engage the assistance of some of

the best writers in that Province for the especial benefit of our Canadian readers. Our proximity to that country, the facilities for communication, and the similarity of soil and climate, give our paper nearly all the advantages of one published in that country; while our present list of able writers, and the extremely low price of publication, are advantages which could not be equalled on that side. Our terms to companies are *only forty cents* per year; and if they are paid for out of the funds of the Society, of course two-thirds of the amount comes from government. If it was made a rule, as some have suggested, that when a member pays his annual subscription for the Society, it shall be understood to entitle him to the paper for a year, it would doubtless induce many more to subscribe, and thus greatly extend their usefulness. We are certain that so trifling an amount could not possibly be expended in any other way so as to produce as much good to the Societies and to the country at large.

We hope the subject will receive early attention, so that the Societies can provide themselves with the present volume complete, as it is very necessary that the numbers be all preserved for future reference. We have personally suggested this subject to the officers of a number of the Societies, and it meets their cordial approbation. They hope that all the Societies will enter into such an arrangement, in order that there may be union of effort, and a mutual understanding throughout the province. We shall be happy to hear from all the Societies on the subject during the coming month.

BATEHAM & MARSHALL.

Rochester, N. Y., July 31, 1840.

Cleaning Clover Seed—Inquiry.

Messrs. Editors—One great defect in our farming is the insufficient use of Clover, and this is in a great measure owing to the difficulty of getting seed. Many of us have not a proper knowledge of the necessary machinery or the method of cleaning it; and if you, or your correspondents, can throw some light on the subject, you will much oblige many Canadian readers. Yours, &c., S.

Port Hope, U. C.

Remarks.—We wish some one of our correspondents, who is familiar with the process, would furnish an answer to the above.—Eds.

Making Cheese—Inquiry.

Messrs. Editors—If some of your correspondents would give the simplest and best method of making Cheese, they would at least oblige one reader. S.

Cutting Grafts in Autumn.

A correspondent writes, "A friend who intends emigrating to Illinois in the month of September, is desirous to be informed if scions for grafting may be cut and transported at that season of the year."

Grafts may be safely cut at any time in autumn after the shoots have stopped growing and have formed a terminal bud. This takes place much sooner on some trees than it does on others. In the *latter part* of the next month, grafts may in most cases be found, sufficiently matured for cutting. They should be wrapped well in damp moss for carrying, and then buried in the earth till wanted.

Correction.

At page 72, we said "The yellow bloom of the *Hypoxis* is only seen on close clays." We had not observed this plant except on close clays, and this agreed with Elliott's observations in the South. Besides we had tried it in garden loam where it declined and died. We have since seen it however, on sandy soils. It would seem that *water* is injurious to the bulb. In loose sub-soils it can dry away, and clays exclude it by swelling and closing up.

Importance of the Education of Farmers.

MESSES. EDITORS.—Although much has been said of late upon the education of farmers, still much more needs be said before the minds of the farming community will be properly awake to this subject. It ought to engage the pen of the ablest writers; it ought to be published in every paper, and proclaimed upon the house-tops, that *ignorance* is the greatest obstacle in the way of successful farming. If any profession on earth requires its followers to be well educated men, thoroughly acquainted with the laws of nature, it is that of Agriculture. In order to success in almost any business in life, it is necessary that those engaged should be well acquainted with the first principles of the profession. Especially is this true of farming. And yet how many there are who are engaged in this important business who are wholly ignorant of its first rudiments. No other profession has ever been the subject of so much abuse by reason of ignorance as this. Before men can engage in most other callings, they must first serve apprenticeship and give a year or more of their service, or they must spend seven or eight years and many hundred dollars in study, before they can be considered as prepared to engage in the intended profession. But any body can be a farmer, is the general opinion. Any body knows enough for that. No matter indeed whether they be any body or not, if they are only in the shape of a man. No matter whether they know A from B, or whether they suppose the moon is composed of the same material as our earth, or whether it is made of green cheese. No matter whether they suppose the earth revolves around the sun and is governed by the fixed laws of nature, or whether it stands upon the shoulders of four huge elephants. No matter at all about these things, if they only know how to plough, sow their grain and cover it up; this is all that is necessary. This has been the too prevalent opinion, although I am glad to say it is fast doing away. Farmers' education has been greatly neglected; they have generally thought that to educate their children was unnecessary. With many the opinion prevails that if they can only read well enough to read a newspaper, (seldom though that they take one,) can write a little, understand arithmetic well enough to add and subtract, their education is sufficient. To study Grammar and Geography would be worse than useless. As the former would make them talk more politely and correctly, and politeness is something that belongs to gentlemen, not to farmers. The latter would make them more acquainted with the world, and therefore create in them a desire for traveling. Philosophy, Chemistry, Geology, Botany, Mineralogy, &c., which are very essential to good farming, are entirely beyond their comprehension, and are generally supposed to be Greek or Latin words. For such people to send their children to an academy, would, of course, spoil them, as it would make them lazy and proud. And this latter objection may be sometimes true; but it is always with those whose natural abilities are not sufficient for a farmer. Therefore, some other business, to which such ones always flee, would be better for them.

What I have said, is not true of all farmers. Yet it is too much so with the majority; and its effects are plainly to be seen. By reason of such ignorance they are frequently duped and defrauded in their intercourse with the more enlightened. By reason of such ignorance they have come far short of that profit which they might have realized had they been more thoroughly acquainted with the principles of farming. And, as a consequence, farmers have generally been considered inferior to persons of other professions; and, therefore, farming has been looked upon by many as rather a low and degraded calling. And farmers have been contented to have it so. They have not considered themselves as good as other men. Like

the African slave, they have been too willing to be trodden down by those whom they considered their superiors. They often regard men of other professions far above themselves. But this should not be. Farming is the most important, and it should be considered the most honorable, occupation in the world. Let farmers arise and take a proper stand in the community, and no longer let it be considered degrading to be a farmer. Let farmers become educated men. By becoming educated, I do not mean that they must be college educated; but let them be instructed in those sciences which are necessary to a thorough knowledge of their profession. Let them be thinking, intelligent men—men of sound minds and honest hearts.

But, one more idea, and I have done. That is this, Farmers compose three-fourths of the inhabitants of this great republic, and upon them, therefore, rests the destiny of this nation. How important, therefore, that they be intelligent, educated, thinking men. Do they consider this? Then let them prepare their sons and daughters to fill a station so high and important. Let them prepare their sons for seats in our Legislatures and our Congress; and I verily believe were these bodies now composed of farmers, we should not see that discord which now prevails in our national affairs. K.

Le Roy, June, 1849.

For the New Genesee Farmer.

Noxious Weeds.

MESSES. EDITORS.—The farmers in this section are letting their farms get overrun with noxious weeds, which will be the means, in a few years, of ruining their best lands, so well adapted to growing wheat. It is only a few years since the farms in this quarter were entirely free from foul stuff of any kind, but of late years, the farmers have become more negligent, and therefore we cannot expect otherwise, than to see the spread of noxious weeds of every kind.

Almost every field in this section and elsewhere where I have traveled, contains more or less of the Canada Thistle, (*Cnicus arvensis*.) To destroy them, some propose ploughing them three or four times in the course of the summer. Others have proposed mowing them as often as they make their appearance above the surface of the earth. But the way to destroy them, is by ploughing and drugging as often as twice in a month through the season; by thus doing they can be entirely destroyed. Johnswort, (*Hypericum perforatum*,) is also becoming very prevalent, and is a very bad weed. Also the Yellow Daisy, (*Chrysanthemum leucanthemum*,) and Sweet Elder, (*Sambucus canadensis*.) The Elder in many places in this vicinity, has almost destroyed large fields, which would otherwise be first rate lands. The Milk Weed (*Lactuca scariola*), is a very destructive weed, but is very easily subdued, by cutting them as often as they appear. I know fields that were a few years ago entirely covered with the milk weed, where now one can hardly be perceived.

The fact is, sirs, if we wish to destroy the above named weeds, it is highly necessary that we do it now, and not put off till to-morrow, because every year they will become more and more prevalent, and soon it will be almost impossible to subdue them.

The Stein Craut, or red root, (*Lithospermum arvense*,) is becoming very common in this region, and has been the means of almost ruining large fields of wheat. A neighbor of mine, has a farm of 130 acres, and the greater part of it is almost entirely covered with Stein Craut, the very worst of weeds among wheat. Fifteen years ago, such a weed was not known in this country—and might have been entirely kept out, if the farmers had been more diligent, and on its first discovery, destroyed it. A few years since a farmer of my ac-

quaintance in this town, raised from nine acres sowing to wheat, 15 bushels of the Stein Craut—very clear seed too. He had not more than half a crop of wheat from the nine acres of land—which had it not been for the stein craut, might have been a great crop, as the land was of first quality. It is evident that the farmers must use some means whereby this noxious weed can be destroyed, or it will be entirely useless to sow wheat.

OBSERVER.

Growing Evils—Canada Thistles.

MESSES. EDITORS.—Having occasion, not long since, to pass through an adjoining town, my thoughts naturally turned to the subject of farming; and as I compared the different farmers together, I thought to myself there is much room for improvement among this class of society which is so often termed the most independent; and *growing evils* were creeping in among them unawares. Occasionally there is a farm to be seen, which looks as though the owner intended to do justice to it, hoping, doubtless, to receive a rich reward for his labor. But he has powerful enemies to contend with. In an adjoining field, owned by his neighbor, several large patches of Canada Thistles were to be seen, growing luxuriantly, accompanied by a good quantity of other evil weeds. Perhaps the Thistles were destined to be mowed down, or in some manner destroyed, but he who has this task allotted him, often overlooks a part of them, (perhaps from a want of interest on the subject,) and they are permitted to go to seed and spread from field to field.— Thus it is from the carelessness or ignorance of one man, that another's cares are increased. Often do we hear it remarked, "You have a fine crop of Canada Thistles, and why don't you destroy them?" "Oh, I have tried and tried, and all that I can do only makes them worse." The fact is, he has only made a mock trial, and as long as he continues so to do he will find himself surrounded by growing evils. As yet I have mentioned but one of the growing evils of our country, and if there were no more, would not *this one* be sufficient to require action on the subject of growing evils? Is it not a subject which demands the attention of every Farmer? Do you ask for a remedy? Peruse closely your agricultural paper and you will find several, but they will avail you nothing unless you practice them. Furthermore, use your best endeavors to persuade your brother farmers to become subscribers to some good agricultural paper, that the mass of farmers may move together, and be active and united on this subject, and then you may anticipate a victory over these and other growing evils. SPUR.

Education of Farmers' Sons.

MESSES. EDITORS.—If a farmer's son knew some thing of botany, geology and agricultural chemistry he might still be a rustic, but not an ignorant man.— As he pursued his daily task he would find himself in that school of nature, where she lights us physical toil by unfolding to the mind at every turn of the plough the rich treasures of her kingdom, and the wonderful secrets of her laboratory. But when grossly ignorant of that science which encircles his daily professions his situation is almost as hopeless, in point of intellectual knowledge, as that of the native Slick of the desert, who asked Savary, the French *royageur*, whether the English or the French made those Ruins.

Ignorance in the farmer is more palpable than in those classes who herd together in cities and villages. In the latter places the most limited information is often concealed by a sort of showy flippancy, acquire by that daily practice which the farmer cannot have.

Far be it from me to deny the farmer's son a classical education;—I am also aware that without a knowledge of some of those languages from whence the English is derived, a truly literary character can hardly

ly be formed; still I must insist, that to a farmer, these studies are not the "weightier matters of the law." I would have him first learn to know something about those sciences which pertain to agriculture. He should know that wheat cannot degenerate into chaff; that in sandy land the fertilizing gasses of manure do not escape by "leaching." That rotten, exhausted manure is not as valuable as it is in its unfermented state, &c. &c.

I repeat, that if a farmer's son has a knowledge of the theory as well as the practice of his own calling, he is one of nature's noblemen, and he will never be considered as either ignorant or vulgar. S. W.

Seneca Co., July 12, 1840.

Irrigation.

Messrs. Editors—In England, where they know hardly any thing about our scorching suns, I am told that irrigation is always practised where the situation will admit of it. How much more necessary then is it in our climate. I have a clayey garden on the bank of the Seneca Canal,—it lies from a level to three feet below the surface of the canal. Until this season I have taken no pains to let the water on to it; but the dry, hot weather now set in so early, that I could but sympathize with those suffering plants which had not yet acquired sufficient size or depth of root to resist its power. I let in the water through small gutters between the hills and rows of vegetables. Its genial influence was instantaneous; in ten days my early potatoes grew two thirds in size of tuber. In fact I have never been able to get any thing like a fair yield of potatoes in this garden before. Cucumbers grew equally fast, even beans and marrowfat peas bore testimony to its quickening power.

I am of opinion that garden vegetables often suffer from want of moisture, that they stand still long before they exhibit a visible show of suffering; that a judicious supply of water, laterally applied, will perfect vegetation during the hot weather with ten fold rapidity. S. W.

For the New Genesee Farmer.

Farmers' Daughters.

Your fair correspondent Annette has hit off, quite to the life, the moral defects which a fashionable boarding school sometimes entails upon a farmer's daughter.

Verily that rusticity which necessarily attaches to the present (but I trust not permanent) social condition of the farmer, is better, far better, than that affectation of effeminate gentility, which marks the character of so many school girls from the country.

But I apprehend that the boarding school (call it fashionable if you please) is not so much at fault as the previous domestic education of the pupil. Ill informed, unlettered mothers, and even fathers, have very crude notions of what ought to be learnt by their daughters, in order to make them truly genteel. Such is the great simplicity of some parents, that they look upon the teacher as a *magician*, who ought, for a sufficient sum of money, to transfer to the pupil the whole value thereof, like an article of merchandize.* Such parents are often so far mystified by the glitter and tinsel of fashion, and superficial accomplishment, that they count as nothing that discipline and laborious exercise of mind, so necessary to consummate the character of an intelligent, virtuous woman.

With such notions, imbibed from the parent, the daughter enters the school. From her more studious, plain, plodding school mates, she turns with distaste; while, to the idle, gossiping and extravagant—the

*To the gross ignorance and credulity of such parents, (and they are legion,) must be attributed the success of that host of empirics, who go about the country pretending to teach the art of writing (Chirography) in twelve lessons; the whole spoken and written in the language of the French in twenty lessons; and *Primo Forte* music, to the most delicate taste, or intractable mechanical ability, in as many more. L.

feetfully excited spoiled ones of wealth, she clings with an admiring and even obsequious tenacity.

Hence it is, that, in spite of the discipline of the best school, the farmer's daughter sometimes comes out of it with few real graces, and less learning; with a distaste for the sober realities of her own home; with her head completely turned, a fit subject to fall a victim for life to some brainless coxcomb, or beggarly, untutored fop!!!

A good education must begin at home,—the fallow ground must be prepared there, by patient and early labor, or the crop will be choked by unsightly weeds!!!

Seneca Co., July 19, 1840.

LUBIN.

From the American Farmer.

Our own Husbandry.

Not our own, but the Husbandry of Mr. A. Drew, Editor of the "Maine Cultivator."

We do not know when we have read any thing with more satisfaction than we did what follows, from the pen of a brother quill-driver—but how can one be called a quill-driver, who inflicts it upon his readers, as we do, with a steel pen?

There is, they say, no mode of teaching so emphatic and effective, as that of teaching by *example*! We may write much, and with some effect, on manuring highly, and well cultivating a little land, in preference to going over a large surface to obtain the same results, with five times the labor; but how much more efficacious is the lesson when practically taught! When, as in this case, the Lecturer tells how he actually *does* support for his family—in vegetables, pork, milk, and butter from a single acre! Most gladly would we imitate our worthy brother who cultivates his acre "mostly with his own hand." We have long been a convert to the theory of plentiful manuring and careful cultivation; and no one entertains a higher notion than we, of the *healthfulness of agricultural labor*! Of all pursuits, the ploughman's is the most wholesome as well as *upright*,—but we must confess, that after repeated trials, we have found all actual labor, actually very fatiguing! The axe—the hoe—the spade—the scythe, and the plough, have each had its brief trial; but, to our shame, we admit that with neither could we keep up our intercourse long enough to contract that familiar acquaintance which is necessary to a certain slight of hand, without which, unfortunately, they cannot be handled with advantage. Few things are so entertaining as to stand by and direct and see others work—so much so that we are even playing overseer without wages. But let not our reader's attention be any longer drawn from Mr. Drew.

"The Editor's notions may be peculiar, but he hardly thinks that it is necessary for a man to skim over his hundreds of acres for the security of stunted crops, in order to *qualify* him as a practical writer on the subject of agriculture. On the contrary, he is inclined to think, that even "a little land, well tilled," by him, gives him as good a claim to speak by way of suggestion and advice, as if he were a *larger* and more *stoutly* farmer. True, all his land is a garden; but this is only what, or nearly what, every farmer should make of all which he cultivates. What is the use of skimming over ten acres to obtain what might be secured from a single acre? Must he who does that be called a *farmer*, whilst he who does this should be set down as wanting in a *practical* knowledge of the principles of agricultural economy!

The Editor actually *cultivates* but a single acre of land, but that he does *cultivate*, and makes it yield all that land can yield. Nor, small as the quantity is, is the amount of subsistence obtained from it unimportant in the support of a small family.—One-third of an acre he devotes annually to corn—the long eared, large evelled, eight rowed, yellow corn, that is not very early, and not very late. With him, it has ripened every year for the last ten years that he has cultivated it. The soil he makes rich. He applies to it, before manuring, at the rate of eighteen or twenty cords of long manure to the acre, (or six to the third of an acre,) and turns it under by the plough. He plants the hills three feet and a half apart one way, and three feet the other—*exactly* by measuring with a line. In each hill he deposits either a shovel full of old rotted manure, or as much night manure as will not over stimulate the crop. From this third of an acre he has realized on the average for years, over thirty bushels of sound corn for grinding, besides a *little* pig corn for the hogs in the fall of the year. This is as much corn as he needs in his family; besides a sufficient surplus for fattening one large or two small hogs. From the

same land he ordinarily obtains some two or three hundred pumpkins, which serve important purposes in the family, besides being an excellent article for boiling up with the hog's potatoes, giving a cow, &c. From the same land, too, he has generally obtained all the dry white beans he has needed in his family to go with his pork—which he raises by the avails of his land, without purchasing of others. The corn fodder is carefully cut and cured, and helps as a subsistence for the cow. So much for *one-third* of an acre.

A small portion of land is set apart for the cultivation of onions. Ordinarily he has raised from fifty to seventy-five bushels on a bed, say half a dozen rods square. These he sells, on the average at one dollar per bushel—say for \$60 per year. This purchases his rye and flour at common prices. So that from the first third of an acre, and an onion bed, he raises all his bread—brown and white.

On one or two large beds, he grows about fifty bushels of mangel wurtzels and carrots. These are for the cow's winter provender. They more than pay for themselves in the milk and butter—to say nothing in the saving of hay and other provender. With a *very* little bay, together with the corn fodder and roots, a good cow—and he finds it economy always to keep the best—may be kept through the winter.

Potatoes for summer and autumn use, are planted on the margins, and wherever there is a vacant chance for a hill, and a department is expressly devoted to them, large enough to raise all that are wanted for the table—and enough to spare for the hogs, &c.

So far, as relates to bread, butter, pork—and he might add, poultry.

Then the rest of the land is devoted to—too many things to be mentioned here—beets—parsnips—cabbages—turnips—green beans—peas—green corn—cucumbers—melons—squashes, summer and winter sorts—&c. &c., besides fruits and flowers of various kinds—grapes, Antwerp raspberries, black do., currants, white, red, black, and yellow;—English and common gooseberries—and a few choice apple, pear, plum, cherry, and quince trees. All this is from a single acre, which he cultivates mostly with his own hand—the same hand that guides this pen;—preferring to do the work himself, not only by the love he has of it, but because he can do it more to his own satisfaction than can any gardener he can hire. As to the practical labors in this matter, he would not willingly yield to any one hereabouts. At least he has never had a man to work for him—how high soever he might stand as a gardener—whom he could not teach."

Another leaf out of the same book.

"Squashes.—If you would raise squashes for winter use, mark out on the surface of the land six or eight spots for hills, eight feet apart each way. Then take a spade or shovel and dig out a circle, say three feet in diameter, throwing the earth out six inches deep. In to each hole empty a wheel-barrow load of old rotten manure, mixed with ashes,—and if there is a little lime in it, so much the better. On this draw the loose earth back which you throwed out of the hole. Now take your spade and dig and mix the soil and earth well together, taking care to pulverize the whole mass faithfully. Level the top off and sprinkle half an inch of rich loam over the top. Drop a dozen seeds on the hill, and press them an inch beneath the surface with the finger. With a hoe smooth and press the top down. If you have a box fitted to receive two or four panes of glass, put this on a hill—or rather, if you have such a thing, place it on the hill before you plant the seeds, and drop them all within the frame. Ultimately leave not more than two plants in the hill to stand. You will find that these will, in due time, run out and cover the land all over, and produce you more, larger and better fruit, than if you had the hills nearer together, or allowed a greater number of plants to stand in the hill. It is well, however, to plant enough in the first instance, as a contribution to worms and bugs. If you save two healthy plants out of the dozen that came up, you will do well, and these will be enough. The roots of squashes under ground, will extend as far and occupy as much space where the soil is free and loose, as the vines will cover above ground."

A Large and Productive Grape Vine.

There is a Grape Vine at Castleton, Ireland, which is 100 feet in length, and so luxuriantly productive as to make it necessary for the gardener to thin it by cutting off 2000 bunches, leaving 3500 bunches on the vine.—*Eng. paper.*

The more pressing is the call, the more ought we to be convinced of the necessity of paying immediate attention to it.

Agricultural Fair at Rochester.

TO BE HELD ON WEDNESDAY, 7TH OCTOBER, 1840.

At a meeting of the Executive Committee of the Genesee Agricultural Society, held at the Arcade House, Rochester, the 28th of July, it was

Resolved, That the Annual Fair of the Society be held at Rochester, on the first Wednesday in October; being the second day of the great Annual Fair of the Mechanic's Association of Western New York.

It was further

Resolved, That premiums be awarded for the following enumerated articles: the amount of each premium to be decided at a future meeting of the Committee, when some estimate can be made respecting the funds of the Society.

ANIMALS.--HORSES.

1. For the best Stallion,
2. Second best do.,
3. Best breeding Mare,
4. Second best do.,

CATTLE.

5. Best imported Bull,
6. Best improved native bred do.,
7. Best imported Cow,
8. Best improved native bred do.,
9. Best yearling Bull,
10. Second best do.,
11. Best yearling Heifer,
12. Second best do.,
13. Best Bull Calf,
14. Second best do.,
15. Best yoke of Oxen,
16. Second best do.,
17. Best yoke of 3 year old Steers,
18. Best yoke of 2 year old do.,

SWINE.

19. Best Bar, showing the most thorough breeding, and uniting the most valuable qualities,
20. Second best do.,
21. Best breeding Sow,
22. Second best do.,
23. Best 3 pigs, not more than 7 months old,
24. Second best do.

SHEEP.

25. Best Buck, uniting the most desirable qualities both for the fleece and for the carcase,
26. Best do. for the carcase only,
27. Best do. for fleece only,
28. Best 3 or more Ewes, as in 25,
29. Best 3 do. as in 26,
30. Best 3 do. as in 27,

FIELD CROPS.

31. Best acre of Corn,
32. Best acre of Potatoes,
33. Best $\frac{1}{4}$ acre of Ruta Baga,
34. Best $\frac{1}{4}$ acre of Mangel Wurtzel,
35. Best $\frac{1}{4}$ acre of Sugar Beets,
36. Best $\frac{1}{4}$ acre of Carrots,

DOMESTIC ARTS.

37. Best pound of reeled raw Silk,
38. Best pound of sewing Silk,
39. Best 5 pounds of Cocoons,
40. Best specimen of domestic manufactured Silk,
41. Best Silk hose or stockings,
42. Best 10 yards domestic Flannel,
43. Best 10 yards domestic Filled Cloth,
44. Best 2 Palm Leaf Hats,
45. Best 2 Straw or Leghorn Hats,
46. Best 25 lbs. of Maple Sugar,
47. Best 10 lbs. of Beet Sugar,
48. Second best do.
49. Best 25 lbs of Honey,
50. Best 25 lbs of Butter,

51. Second best do.,
52. Best Cheese, of not less than 20lbs.,
53. Second best do.,

AGRICULTURAL IMPLEMENTS.

54. Best Plough, shape and manufacture,
55. Second best do.,
56. Best Harrow,
57. Best Cultivator,
58. Best Planting Machine or Drill,
59. Best Horse Rake,
60. Best Threshing Machine and Horse Power,
61. Best Fanning Mill,

HORTICULTURE.

(A FUND RAISED BY AMATEURS AND GARDENERS.)

A premium will be awarded for each of the following articles:—

- The best 2 heads of Cauliflower, Broccoli and Cabbage—6 each of Beets, Carrots, Parsnips, Turnips, Salsify, Onions, Celery, Tomatoes—3 each of Pumpkins, Squashes, Muskmelons, Watermelons, and Eggplants.
- Best dozen each, Apples, Peaches, Pears, Plums, and Quinces,
- Best specimens of Grapes, ripened in the open air.
- Best 2 bouquets of cut Flowers.
- Best assortment of Double Dahlias.
- Best dozen do.

Discretionary Premiums will be awarded for such articles not enumerated, as the committees may deem deserving, according to the funds of the Society.

Explanations.—No person will be entitled to a premium, who is not a member of the Society.

All animals exhibited for premiums, must be owned and kept in Western New York.

The articles of domestic arts must be manufactured or produced in this country, this year, by the person or the family by whom they are exhibited.

No premium will be awarded for articles which are not deemed worthy, or where there is no competition.

Persons competing for the field crops, must measure, or weigh, a few rows or square rods of an average growth, in the presence of two disinterested individuals, whose affidavit, in writing, shall be given to the committee at the Fair. A statement of the mode of culture, kind of soil, &c. for each crop, is to be given for publication.

Ploughing Match.—If suitable arrangements can be made, there will be a Ploughing Match at the time of the Fair; notice of which will be given hereafter.

A Fair for the Sale and Exchange of Stock, will be held on Thursday, the day following the Exhibition, if deemed expedient by those most interested.

An Address will be delivered; and suitable arrangements made for such a Fair and Exhibition, as will do honor to the farmers of Western New York, and be worthy of the high reputation of "Old Genesee;" while at the same time, it cannot fail to exert a most powerful influence for the promotion of agricultural improvement.

(Further particulars will be given hereafter.)

L. B. LANGWORTHY, President.

H. M. WARD, Secretary.

To the Friends of the Gen. Ag. Soc.

Owing to the pressure of farming business during the past month, but little has been done by way of obtaining the signature of members for the Society, and only a few of the Circulars have been returned. The Executive Committee therefore request the friends of the cause, to retain the papers another month, and make an effort to obtain as many names as possible, in time to report them to the Secretary, by the 10th of September next.

All Post Masters in this and adjoining counties, have received the Circulars, and they are respectfully solicited to give this subject their attention, or place the papers in the hands of some suitable person who will attend to it.

A Meeting of the Executive Committee

Of the Genesee Agricultural Society, will be held at the Arcade House, Rochester, on Saturday, the 12th of September, at 11 o'clock, A. M., to appoint committees, and make arrangements for the coming Fair. A full attendance is very desirable.

New Agricultural Societies.

The embarrassed state of the country, and the low prices of ordinary farm productions, seem to have a tendency to awaken the minds of the farming community to the necessity of a more varied system of husbandry, and of bestowing more attention to domestic arts and manufactures. For this purpose they see the importance of forming Agricultural Societies, and of encouraging emulation by exhibitions and the awarding of premiums. It is with much pleasure that we have seen notices of the formation of several new county societies within a short time past. Among them is one in Ontario County; but we have been so much from home that we have not learned the particulars concerning it.

The Genesee County Agricultural Society was formed at Alexander, early in July; and a constitution of the usual form for a County Society was adopted.—Mr. T. C. Peters of Darien was appointed President, and C. P. Turner, Esq., of Batavia, Secretary. Seven Vice Presidents and twenty-four managers (one from each town) were also appointed. It was resolved to hold an Exhibition and Fair at Batavia on the 14th day of October. A list of articles for which premiums will be awarded was published. We regret that the proceedings of this Society did not meet our eye in time for us to make room for them in our columns this month. We will give a more full account of this and the Ontario Societies in our next.

An Appeal from the Publishers to the Readers of the New Genesee Farmer.

We dislike to occupy our columns with our own affairs to the exclusion of other matters; but justice to ourselves and our readers, requires that we should occasionally make known our wishes and intentions.—When we commenced the publication of this paper, we were conscious that it was a great and arduous undertaking; but under a full conviction that such a paper was needed, and encouraged by the friends of the cause, we determined to engage in the business.—Aware of the prejudice and opposition which had been excited against the paper, we expected, as a matter of course, to have to wait some months before the public could rightly judge of our labors, and confidence be established. Many of our friends at a distance informed us that their neighbors declined subscribing, because they were afraid we could not succeed, and they wished to wait till they were satisfied the paper would be sustained. Others thought we could not obtain the aid of writers and correspondents of sufficient talent to make the paper respectable, useful, and interesting. These were natural excuses, and we did not complain; but now we have been eight months before the public—now, what say these fearful ones? Have we not fully redeemed our pledges, and maintained what we assumed? Cannot the paper be sustained, and have we not obtained the assistance of a large number of the most talented and practical writers in this or any other country? Is not the paper as respectable, as useful, and as interesting as its predecessor, or any similar paper in existence? Is it not better calculated to advance the interests of agriculture generally, during these times of pressing economy, than any other publication? If these questions are answered in the affirmative, as they already have been by hundreds of our readers, is it not the duty of each of them to do something on their part to assist us and extend our sphere of usefulness? It is true

any of our friends have done nobly, and perhaps our excess is as great as was to have been expected under the circumstances; but it is also true that many have not done what they could, or what we consider *their duty to us and their neighbors requires of them*. We frequently find respectable farmers who have never been shown a copy of the *New Genesee Farmer*; and would readily have subscribed for it if they had been solicited to do so. There are thousands of rich farmers in the land, and one or more can be found in almost every neighborhood. We are quite sure that if our readers would *only try*, our subscription list would be doubled in less than one month.—We know the cry of “hard times” is still sounding throughout the land, and we *feel* there is too much reason for it; but at the same time we are unwilling to believe that the farmers of this rich country are unable to raise fifty cents, or that they are unwilling to give it for this paper, if some friend would rightly present the subject to them. It may be that some have relaxed their efforts, from the belief that enough has already been done to secure the support of the paper; but we are sorry to say such is not the case. The present list of subscribers will not pay the expense of publishing the present edition through the year; and although we have pledged ourselves to continue its publication through the year, we will not promise that it shall be continued any longer than that time unless there is a considerable increase of subscribers. We could exceedingly regret the discontinuance of the paper, and so we know would hundreds of others, but when we have sacrificed time, labor, and health in the undertaking, without compensation, it cannot be expected that we should sacrifice money also. We now our readers will not ask it—we do not believe they will allow it. If we judged rightly last year when we declared that the agricultural community of old Genesee and the Great West demanded the continuance of the *Genesee Farmer*, we shall expect to receive a speedy answer to this appeal; but if we were mistaken we must abide the consequences. *Readers, what is your answer?*

BATEHAM & MARSHALL.

Rochester, Aug. 1, 1840.

A Voice from Michigan.

The following letter is one among many of a similar import, which we have received during a few months past, from various parts of the Western country.—*Ms.*

MESSRS. EDITORS—I wish, through the medium of our paper, to address a word or two to the friends of agriculture generally, and particularly to those of the West. I have waited until more than one half of the first year of the “*New Genesee Farmer*” has expired, and I might judge correctly of its merits, and of the spirit with which it would be sustained, before taking any active measures for its support. But although not prejudiced against it by cautions which were issued by L. Tucker in the old *Genesee Farmer*, and continued after “the project of J. E. Force” was abandoned, I have become satisfied, and doubt not all of our readers are also, that whether the *New Genesee Farmer* has the spirit of the old or not, it is managed with a spirit and ability which will not suffer by a comparison with any other work of its kind in the United States; and will I trust, be able to “stand” altogether on “its own merits.”

The particular reasons why I would urge upon them its support are, first, that it is a good practical work, well adapted to the soil, climate, and mode of cultivation in the West; and second, that it is endeavoring to sustain itself in its infancy against a strong and unjust opposition; and finally, that it is not only for the interest of the farmer to read, but to support agricultura-

ral journals, particularly when afforded at the trifling expense of the one now under consideration. Cases very frequently occur in which the information contained in one number might be of more value than the cost of the subscription during the whole period of a man's natural life. I would therefore make this proposition to each of the subscribers of the *New Genesee Farmer*, that they, by their solicitations among their friends and neighbors, procure at least two new subscribers each, and as many more as they can. The money can be handed in to their Post Masters, who are all requested to act as agents, and who can remit the money free of postage. I willingly pledge myself to any who will take and read it all attentively, and will preserve the numbers, that if they do not feel satisfied at the end of the year, that they have received the full worth of their money, if they will forward me their papers, I will refund their money, postage and all, in full.

By thus affording this trifling aid, which is in the power of all, we may sustain a paper which will not only be a benefit to ourselves, but to our country at large.

MESSRS. EDITORS—Enclosed, I send you three dollars for the persons whose names are annexed. I will endeavor to obtain more subscribers soon.

Yours, &c.,

J. F. CHUBB.

Byron, Kent co., Michigan, July 1840.

Hints for the Month.

The wheat crop being gathered, farmers should now spare no pains to procure clean seed for the succeeding crop. The best varieties of wheat should be sought, and the seeds of all weeds, especially of chess, carefully cleaned out.

Weeds should not be neglected at this season. Corn should be cleared of them, late in the season though it may seem. It will save much labor next year. A piece of ground was kept clear of weeds during the season; another, adjoining, but imperfectly; the following year the mangel wurtzels on the former piece were cultivated with very little labor, on the latter they were overrun with rank weeds.

Canada thistles will need attention, that they do not ripen their seed. Field thistles in pastures should be destroyed. Mullins eradicated.

Root crops, too often neglected in this month, should be kept clean.

Under draining on wet grounds, is best performed about this time. Farmers, to cultivate their fields profitably and satisfactorily, should have all parts equally dry; all wet portions should therefore be made dry by ditching.

Open drains are useful only in carrying off surface water, covered ones for wet grounds and springs.—Open drains are necessarily shallow, or else very wide, and always occupy land; covered ones may be easily and cheaply made of any required depth, and occupy no land. Stones covered with slabs and then with straw, are an excellent filling where soils are friable and consequently apt to fall in.

Brush drains are made in soft soils where stones are scarce, by placing freshly cut branches of trees with the leaves on, in a sloping position in the ditch, the leaves upwards, and then filling in the earth.

Many farmers become discouraged with ruta bagas, from the great labor of hoeing at this time. To avoid this difficulty get the ground thoroughly clean before sowing the seed. Begin this fall, and plough and manure the ground; next spring plough and harrow several times at intervals. The weeds will be thus killed and the ground made in a first-rate condition, and the subsequent culture will be very trifling. By a similar course we have seen turnips raised at a cost of only a

cent and a half a bushel. Don't give up before another fair trial.

For the *New Genesee Farmer*.

Bad Seeds—again.

I purchased in the spring, at the Rochester Seed Store, a small quantity of mangel wurtzel seed. Some of them I planted myself, and the ground being dry, I put them in about three inches deep, being resolved they should grow. Another portion of them I left for my hired man to plant, who, I ascertained, put them in still deeper. The first came up rather thinly, although abundance of seed was used; and the second scarcely grew at all. As some of my neighbors had been equally unsuccessful, the conclusion necessarily followed that the seeds, if not the vendors, were no better than they should be.

Having some seed still on hand, and a little more vacant ground, after a rain I concluded to plant the remainder; but working rather in despair than in hope, I buried them only an inch deep, dropping them by the line without making any furrow. The result was they came up as thickly as could be expected from the best of seed with the best of culture. I concluded it must be rather a difficult business to pursue, where one's honesty was thus established merely by accident; and that before condemning others, we should be careful that we ourselves had done our part for insuring success.

J.

Wayne Co., July 28th, 1840.

Remarks.—With all the precaution which can be used, seedsmen are liable to err, and have sins enough of their own to account for without being made a scape goat for others. Still they are generally made to bear the blame, not only for their own misdeeds but for the mistakes of their customers, and of even for unfavorable weather. A number of my customers have complained of the failure of Mangel Wurtzel, Sugar Beet, and Carrot Seed, this spring. But on investigation I have in most cases been able to account for the failure, without attributing it to the seed, although it is generally difficult, or impossible to convince the purchaser that the seed is not at fault. In some few cases I have known these seeds fail, where to all appearance they had been sown under favorable circumstances; and while I knew for a certainty that the seeds were good, I could not satisfy myself respecting the cause of failure.

The Mangel Wurtzel, Sugar Beet and Carrot Seed sold from the Rochester Seed Store this year, was all fresh and good. Most of it was harvested under my own observation; and its vitality was fully tested this spring. Many fine crops are now growing from precisely the same lots of seed as have failed entirely in some cases. In order to satisfy their minds, I now request that any persons who failed, if they have any of the seed left, will test it carefully themselves. If Mangel Wurtzel or Beet Seed, break open some of the capsules and pick out a few grains of seed without injury, and plant them in a box or pot of fine earth, which keep moist, and stand where it will not be exposed to the full heat of the sun. If Carrot Seed, soak it 48 hours in rain water, and sow it the same as the other. If done with care I pledge myself they will vegetate freely.

If any of the readers of the *Farmer* can throw any light on the cause of failure of these seeds when circumstances appear favorable for vegetation, I should be pleased to have them communicate through the columns of the *Farmer*.

M. B. BATEHAM.

Rochester Seed Store, July 28th, 1840.

Preserving Fruit Trees.—Where your fruit trees appear to be overloaded with fruit, it is better that you pick off a part before the weight is so much increased as to split and destroy the trees.

To the Editors of the New Genesee Farmer:

My circumstances have elicited a few thoughts on the practical application of one of the excellent code of "rules for a good neighborhood," which appeared not long ago in your valuable paper. The rule to which I allude I find in Matthew VII. 12, also in Luke VI. 31; the substance of which is, "Do to others as ye would they should do to you." If you deem my remarks on the application of this rule to a prevailing custom in our country, worthy of a place in the columns of the New Genesee Farmer, you will oblige your humble friend by inserting it.

The Golden Rule.

MAT. VII. 12.—All things whatsoever ye would that men should do to you, do ye even so to them: for this is the law and the prophets.

Were all men to regulate their conduct towards their fellow men according to this rule, no one will say that there could be any such thing as quarreling among men. All consent that the rule is a good one, and yet but few adopt it in their practice. The grand objection which individuals have to putting the rule in practice, is that others will not if they do; and therefore many adopt this rule, "to do to others as others do to them," as a rule better adapted to secure their rights. As a practical illustration of this latter rule and its evil tendency, I will relate an anecdote: In the early part of this season, as soon as the snow was gone, the farmers generally turned their swine into the woods to feed upon beech-nuts, which were pretty abundant in this vicinity at that time. Many complained that swine were very troublesome in their sugar works, as but very few had their sap bushes fenced, and more complained that while their sugar business demanded all their time, so that they could not repair their back fences, the hogs were crowding by scores into their fields and destroying their potatoes which were buried there. But no man seemed to think of the expedient of *taking care of his own swine*; because every man seemed to think that if his swine were taken up, *others* would trouble him about as much. A very few had their fields enclosed with a fence sufficient to secure them against swine, and they could turn out large numbers of swine of all sizes, and then say that they were willing their neighbors should do as they did. This is one way of observing the Golden Rule. But will those who thus accommodate the rule to their circumstances be pleased to have their neighbors who keep no swine accommodate the rule to their circumstances, by saying that they will kill all the swine that get into their fields, and they are perfectly willing that their neighbors should do the same? No, they will see that this is not acting according to the Golden Rule. No man who means to observe the Golden Rule as the rule of his actions, will suffer his animals of any kind to run where there is any probability of their troubling his neighbors, unless his circumstances absolutely require it, and then he will be willing to make restitution for all the damage they may do to any one. Neither will any man who acts according to the said rule, intentionally injure any of his neighbors animals that trouble him.

If for one do not keep any swine, for this reason:—Experience teaches me that pork is not the kind of food that gives me health of body and vigor of mind, and observation leads me to conclude that it does no afford to other men what it denies me. And I cannot but think that this was the reason why the Benevolent Lord prohibited the Israelites from eating it; and why the kind-hearted Jesus gave the devils permission to enter into the swine of the Gadarenes. Mat. 8. 32.

But as I wish to enjoy the right to my own opinion on this subject as well as all others, the Golden Rule teaches me to be willing to have all others enjoy the same right to theirs.

With regard to the expediency of the above rule, it is generally admitted that it would be expedient for all to adopt it if they would: but some think that it would be inexpedient for one to adopt it while another will not. Let one man be perfectly just to his neighbors, and if others will not be just to each other they will consider themselves bound to be honest with him. Though he may sometimes be called to endure grief, suffering wrongfully, will it not be a sufficient reward to be approved by his own conscience and by all his neighbors? And will not his neighbors think that his example, which they cannot but approve, is worthy of their imitation? Such a man supports good and wholesome laws by obeying them, "for this rule is the law and the prophets."

D. A. SWEZEY.

Harmony, N. Y., July 17th, 1840.

The Curculio.—Pick up carefully all the fallen fruit under your trees, and give it to your hogs. You will thereby destroy the curculio, a small insect which has caused it to fall, and which if not destroyed will perfect itself in the fallen fruit, sink in the ground, and the next spring rise and again destroy your fruit.

White Cabbage leaves.—Cabbage leaves, a little meal, salt, kitchen swill, crumbs, potato peelings, &c., mixed well together, are capital food for fattening pigs—save all your ground leaves for this purpose.

From the Farmer's Monthly Visitor.

A Proposition.

FARMERS DEVOTE TOO MUCH TIME TO MANUAL LABOR.

No dictate of common sense can be plainer than that men, whatever be their pursuits, should make that use of time which will best promote the great objects of life. To pursue trivial objects, or to pursue those which are in themselves laudable, to the exclusion of others which have greater claims, is, therefore, alike unworthy of a rational being. The duties which devolve upon men are various. While nature calls upon them to make the necessary efforts to obtain the means of subsistence, she also demands that it be done in subservience to the laws of health. While the cultivation of the earth is an important duty, the obligation to cultivate the noble faculties of the mind is not on this account less binding. If the body has claims for food and clothing, the mind has claims not less obligatory for that moral instruction and intellectual training without which life is of little value.

Among the principal duties which rest upon the farmer in discharging his obligations to himself and family, appear the following:—Moral and Religious Instruction; Intellectual Education; the means of an honest support, and obedience to the laws of health. In attempting to show the truth of our proposition, it will be convenient to consider these separately.

1. Moral and Religious Instruction. To attempt any labored arguments in proof of the value of these, would be superfluous. But some seem to suppose that a sufficient acquaintance with the duties of morality and religion may be obtained on the Sabbath.—Now, while it is admitted that such instruction belongs more particularly to that season, there appears to be no valid reason for excluding it from the remainder of the week. If the practical duties which morality and religion enjoin, were of secondary consequence—if they were mere Sabbath-day exercises, such views might have some foundation; but as men are required to love their Maker, and do good to their fellow men at all times, reason seems to require that some portion of every day be devoted to the study of the principles on which these obligations rest.

2. Intellectual Education. Independent of that discipline of mind and that general information which every farmer should possess, no man can master the science of agriculture without much study and reflection. In farming, as in most other pursuits, theory and practice should be united. The farmer must not only labor, but he must read and reflect; and for these he must have time. The day has gone by when it was a sufficient excuse for following an observed practice because our fathers and grandfathers did so.—When the nature of our soil is under investigation, when the Press is teeming with information, applicable to all the various departments of agriculture, and when every man can contribute something to the general stock of information, has the intellect no claims upon the time of the farmer? When science is laying her treasures at his feet, can he shut his eyes to the

advantages which are in prospect, and deny himself time to read, and to apply the principles of science and the discoveries of art to the practical purposes of life? If there be any obligation which is preeminently binding upon the farmer, it is to avail himself of those helps which the agricultural press is placing within his reach.

3. The means of support. It is a very plain duty which binds a man to furnish for himself and family an adequate supply of food and clothing, and a duty which farmers seldom overlook. It is in the performance of this that they consume much of the time that should be devoted to other purposes; or rather this furnishes the excuse which they offer for the neglect of the others. The common practice in New England seems to be to employ, for two-thirds of the year, almost the whole time, except what is necessarily consumed in sleep, to the labors of the field. The deadening influence which this practice exerts upon the mind is too obvious to require comment. Owing to this absurd custom, the winter evenings, which of the time left for improvement, become of comparative little value. Who, after eight months of unremitting toil, can sit down and spend an evening in vigorous thought, or even in such reading as requires attention?

But it is said that this is a matter of necessity—that all this labor only furnishes the bare means of subsistence. Doubtless many really believe this; but it is a reflection upon the goodness of the Creator to suppose that he would mock man by giving him faculties capable of improvement, and then placing him in circumstances which preclude their use. If men were less eager in their desires of gain, and more willing to follow nature rather than fashion in their manner of living, they would find less necessity for constant labor. But were there no means for lessening the expenses of a family, it by no means follows that the present system must be pursued. It is not a necessary consequence, that if the farmer spends more time in intellectual pursuits, he must diminish his income. Agriculture is not yet so far advanced that study can afford no additional aids. Experience shows that those who labor the most hours are not the most successful, even in acquiring wealth. The inference is plain, that intellectual labor is no less profitable to the farmer than manual labor.

Of course no conclusion can be drawn from what has been advanced, in favor of idleness. Constant toil is infinitely preferable to sloth; but a division of between the mind and body is better than either.

4. Obedience to the laws of health. One great objection to the present system of labor is that it shortens life. By statistics which have been collected at different times, it appears that the average life among farmers is but little, if any greater than among professional men. Taking into consideration the known difference between active and sedentary habits in their effect upon the human constitution, no other satisfactory solution of this can be given than that the farmer shortens life as much by over exertion, as the professional man does by neglect of exercise. Indeed how often do we find farmers at the age of forty or fifty with the stiff joints and decrepit forms which belong to those of three score and ten? This is the legitimate effect of transgressing the laws of health. But besides the violation which is done to nature, this endless toil defeats its own object. The man who gains ten years for labor by neglecting to cultivate his mind, and wears himself out before the "debt of nature" is due, cannot surely be a great gainer.

These considerations, it is believed are sufficient to establish the affirmative of the proposition at the head of this article.

OBSERVATOR.

Keene, Jan. 13, 1840.

The Farmer's Life.

BY H. COLMAN—AN EXTRACT.

What a means of imparting pleasure is an improved agriculture. How many charming examples present themselves among us of improvements which every eye gazes upon with unmingled delight. Let a man according to his power, take his ten, his twenty, his fifty, his hundred acres. Let him comb the hair and wash the face of nature. Let him subdue, clear, cultivate, enrich, embellish it. Let him smooth the rough places, and drain the wet, and fill up the sunk en, and enrich the barren. Let him enclose it with neat and substantial fence. Let him line its borders and road sides with ornamental trees, and let him stock every proper part with vines and fruits. Let his fields and meadows wave with their golden harvest and let his hills be covered with the herds rejoicing in the fulness with which his labors, under the blessing of God, have spread their table, and who, when he goes among them, hasten from all sides to meet him

and gratefully recognize in him a friend and benefactor, and lick the hand which is accustomed to feed and fondle them. Here now let us see the neatly painted cottage, with its green shades, its piazzas trellised with vines, its sides covered with the spreading elm or flowing sycamore, with here and there the beautiful fir to shade the picture, and the mountain ash showing its rich clusters of crimson fruit among the deep green foliage, and the smooth and verdant lawn stretching its smooth and beautiful carpet in the front view; then look again and see the parents at the close of day, resting from their labors and enjoying the calm evening, with the pledges of mutual and devoted affections, rioting before them in all the buoyancy of youthful innocence and delight; and if, at each hour as this, you can hear the hymn of grateful praise rising from this humble abode of peace and love, and its charming notes mingling with the music of the murmuring brook that flows near by, or broken by the occasional shrill and hollow notes of the gentle and careless birds, which deem themselves members of his loving household; if then, whether traveler or sojourner, your heart is not touched with this charming and not unusual picture of rural felicity, cease to call yourself a man. If still you sigh for the bustle and the noise and the confinement of the city, with its impure vapor and offensive odours, with its despicable affectations, with its heartless formalities, with its violent excitements, with its midnight festivities; with its utter destitution of sympathy, with its low estimate of human life, with its squalid poverty, its multiplied forms of wretchedness and crime, its pride, its vanity, its ambition, its pomp, its servility: then go back to your gilded prison house, and to pleasures, which an uncorrupted and refined taste, accustomed to drink in the free air of heaven, and to appreciate its freshness, its purity, and its salubrity, will find no occasion to covet or envy. The man who by his cultivation and good husbandry, presents such a picture to the passer by, shall he not be called a benefactor to the community! Has he not done much to improve and bless society by his example? Has he not built a monument to his own honor more eloquent than the marble?

Dwarf Fruit Trees.

In some places, especially in France, a method prevails of cultivating dwarf fruit trees. These are said by English and French writers to have many advantages. The trees are not as much exposed to high winds, they produce better fruit, bear earlier and more abundantly.

Dwarf trees are produced by inoculating on stocks of comparatively slow growth. Thus by inoculating the apple on the Paradise or Doucia stock, the peach on a slow growing plum stock, and the pear on the quince, &c. This is practised here, more particularly, in gardens where the trees are set along the borders alternating with gooseberries or currant bushes.

The pruning and management of dwarf apples and pear trees, are well described in the following remarks:

The first subjects of the following remarks, from their appearance, were planted six or seven years previously to the commencement of any pruning being given them. In consequence they required to be very much thinned out, so as to get the branches clear of each other. For thinning I always bore in mind to cut off the old wood close to the stem or branch it was attached to; this prevented young wood springing afterwards. When the trees were thinned of the old shoots, as above stated, the young side shoots were what is generally termed, spurred in; that is, they were so shortened, that only two or three buds were left on them, and the leading top shoots were shortened to half their length.

The following and every succeeding year, the trees were treated in the same manner, as respects the young wood, till they had acquired the desired height, when the leading shoots were shortened, as the side shoots or spurs had been previously. When the leading shoots show a disposition to grow very luxuriantly, which is apt to be the case under this treatment, they should be prevented doing so, by cutting off part of the old wood along with the old shoots immediately above a flower bud. This will prevent the shoot so cut from increasing in length. The spurs must be treated in a similar manner, by cutting off a small portion of the old wood along with the young, when they are getting too long.

I have never found the above treatment prevent the fruit swelling, or in any way detrimental to it; but on the contrary, it was always improved.

Young trees are to be treated in the following manner: if there are more than three shoots on the plant, reduce them to the number, and shorten each to three, four and six eyes, according to their strength. The

following season reduce the number of leading shoots to six, and shorten them to three-fourths of their length, and spur in the remaining shoots. The tree should be managed in every respect in this manner until it has attained the required size, which of course depends on the convenience or fancy of the owner, or conductor of the garden.

I make a point of letting the trees take their natural form of growth as far as the system described will permit; for I consider it of little consequence what shape is given to the tree, provided my end is attained; that is, to make every branch as it were a long spur, with bearing buds from the base to the extremity.

Two or three years' trial of this method only, might possibly deter many from a continuance of it, in consequence of the quantity of young wood which will be produced yearly at first, and from the apparent difficulty of getting rid of the superfluity. But that inconvenience will be ultimately surmounted if the foregoing instructions are attended to, and the continuance will be the possession of both healthful and fruitful trees. To attempt to bring very old trees into this method of management would be attended with difficulty, unless they were cut down short and allowed to make new heads, which I should recommend where their produce can be spared for a time. In a few years fine healthy heads would be formed, which will yield fruit superior to any that could be expected from them if left in their rude state. But if the trees cannot be spared to be headed down, they may be very much improved by thinning out the spray, and cutting out a few old branches, which will cause them to throw out young shoots, and these in a short time will become bearing wood. The remainder of the old branches may be thinned out with effect. Even if this process is performed only once in two or three years, and the stem and branches well cleared of moss and dead bark, it will be of great service to the trees, and be a means of keeping them free from insects, and giving them a neat and clean appearance.—*Practical Farmer.*

Science and Agriculture.

SIR—I have for a long time been deeply impressed with the importance of agriculturists acquiring scientific knowledge, to assist them in bringing to perfection their truly honorable vocation; and I have been led to regret that very many of our farmers have forgotten, or never learned, that the true interest of agriculture is achieved only when the farmer can avail himself of the advantages which scientific knowledge places within his reach. Many farmers seem satisfied with the way in which their fathers trod in tilling the soil, satisfied in knowing just as much as they did, and perfectly satisfied in educating their children after the old fashion. Hence, seeming blind to the importance of a more liberal and enlightened policy, there are still, perhaps, some few farmers content if their children but learn to "read, write and cypher," ignorantly supposing that this is all-sufficient for a farmer; that as their fathers got on "well enough" with this amount of knowledge, their children can also do well enough without book learning. I will not speak of the fallacy of this kind of reasoning; I only regret that it is by far too prevalent.

The truth is, the agriculturist occupies an important station in society; no vocation is more honorable, and none, when properly pursued, that sooner insures competence. Hence the importance of acquiring such knowledge as will assist him in developing the resources of nature and bringing to his aid such means as will produce the most beneficial results in the cultivation of the earth. Every farmer should be an educated man; he should not be satisfied in being able to read and write, and "cast up accounts"—he should achieve more than this for himself, and much more for his children. He should be able to ascertain, by chemical analysis, the nature and properties of the soil he cultivates. As the science of chemistry is intimately connected with that of agriculture, he should be familiar with its principles, that he may reap the advantages which its truths reveal. He should be able to define the nature and properties of plants, vegetables and flowers, ever remembering that, ignorant of these things, he loses many opportunities, not only of profit but of enjoyment. Hence, the farmer should be a botanist, both practically and theoretically. This is not merely the opinion of the writer; every man with a just conception of the vast improvement of which the science of agriculture is susceptible, will subscribe to it all I have said. Mr. Van Bergen remarks, in his excellent address delivered before the New York State Agricultural Society, that the business of the agriculturist "involves the laws of chemistry, botany and geology. By the last he is to judge of soils and their

fitness for certain products; by the second he must determine what plants are most suitable to his soil and climate; by the first he must be instructed in that most important branch of knowledge to the farmer—the nature and composition of manures, and their fitness to the several kinds of grain and fruits he proposes to cultivate."

It may be said by some one that he is too old to learn these things now; that while occupied in acquiring this knowledge, his farm would go to ruin! How utterly ridiculous! yet how often is the above remark heard! Every farmer, however, has some time to spare; there are seasons when, without any prejudice to his interest, he might employ himself profitably in the acquisition of useful knowledge, that would abundantly pay him for the time and labor bestowed.—But if too indolent or indifferent about the matter for himself, let him educate his children; and, as some one has aptly remarked, "let every farmer who has a son to educate, believe and remember that science lays the foundation of every thing valuable in agriculture."

I have said that the vocation of the agriculturist is an important and honorable one, and I believe it.—From this class of the community have arisen some of the brightest ornaments of our country; men who would have conferred honor on any station; and let our farmers but awake to a full sense of the importance of education, of acquiring knowledge themselves, of imparting it to their children, and applying it to their profession, and they will learn of a truth, "that all the energy of the hero and all the science of the philosophers, may find scope in the cultivation of one farm.—*Am. Var. Com.* J.

Centerville, Kent Co., Md.

Cabbage Plants.

A sure—but rather troublesome—protection of cabbage plants against the grub worm, is to go out into the woods and get lots of strips of birch bark from small trees. These will naturally maintain the shape they sustained on the tree—round like a wafer box, without top or bottom. They should be about two inches high or deep. Let each strip enclose a plant, and press it gently in the earth. The grub can then neither crawl under nor climb over it. Look he ever so wishfully that way, he cannot set his teeth into the delicious fibres of the young cabbage stalk.—*Maine Cultivator.*

WHITE GRUB WORM.—The white grub or "dung worm" which infests sward lands, and in some instances does great damage, by eating the roots of grass, is, when it emerges from the chrysalis state and becomes a perfect insect, what is commonly known as the May Bug, or cockchaper, which secretes itself by day and rises only by night. A good way to destroy them is to make a fire in the field after dark, by the light of which the swarms that arise from the earth will be attracted, and by the heat of which they will be destroyed. The perfect insect, as a flying bug, is quite harmless; but the eggs they deposit in the earth before they die, will generate myriads of new grubs which will do essential injury to the grass roots.—*ib.*

To prevent the Destruction of Corn by Crows.

Mr. C. Nichols, of Mass., gives the following recipe for preserving corn from destruction by crows and blackbirds. Although out of season now, we put it on record for reference when planting time again approaches. We copy it from the Monthly (N. H.) Visitor.—*Am. Var.*

"In the spring of 1837, I ploughed a piece of mowing, which I wished to bring into a better condition, consisting of about one fourth of an acre, upon which I planted corn, and when up about three to four inches, these marauders came and destroyed full twenty-five per cent of it. In the spring of 1838, I planted about three acres—the seed prepared agreeable to the recipe, and it all came up in seven days—and when at the height of the former, the enemies came, pulling a spear or two of three or four hills—tasted the flavor of the seed, and left them attached to the root of the stalk—which was the first and last of this visit. I imputed the effect to the seed being so strongly impregnated with the solution, that it was offensive to their taste.

RECIPE.—Dissolve 2 lbs. of saltpetre in a peck full of soft water; in this situation I put 3 pecks of seed—soaked 24 hours—rolled it in plaster, planted and covered it while it was moist. It must not be exposed to the sun, or current of air, as evaporation passes off rapidly. As I remarked, every kernel came up in seven days. I think the alkali must have forced its germination, and the plaster had an effect to keep it in a state of moisture."

The Flowers of Summer.

The *White Lily* is much finer when it has some protection in winter. It will live without it for a time; but with us it has gradually declined when exposed in the open border. In the covered border, it seems to be at home.

Lilium chalcedonicum (scarlet martagon) is beautiful, and the petals so revolute that some of them frequently clasp the peduncle. The stalk supports one or two flowers. It is a native of the Levant.

Lilium japonicum has declined with us of late years, and no longer produces flowers. This may be owing to deep planting, as Loudon mentions that some set the bulbs in pots, "not lower than an inch from the surface of the mould." Others take them up in autumn, and as they are tender, keep them in dry sand till spring in the cellar. We hope to profit by these hints.

Lilium tigrinum (tiger lily) from China is very hardy, and well suited with our limestone soil. With reasonable cultivation, it grows five or six feet high; and produces showy flowers of a reddish yellow with dark spots, resembling the color of the tiger. The bulbs that form on the stalk, grow freely, and often flower the next season.

Lilium superbum does best in a boggy soil. In a shaded border of vegetable earth, it blossoms year after year, but not with the splendor it attains in its native localities. It is indigenous to some parts of this State.

Within a few years, the genus *Pentstemon* has furnished many interesting species for the garden. *P. digitalis*, three feet high with white flowers and large radical leaves, deserves a place. *P. diffusum* more humble and spreading, presents a greater variety of colors (light red tinged with blue.) *P. larigatum*, very smooth and erect, has pale flowers striped on the inside with purple. *P. Pulchellum* very neat and pretty, varies in color; and gives florists an opportunity to multiply specific names.

Spigelia marilandica is interesting as the Pink Root of the shops; but it also has beauty and singularity.—Contrary to the usual order of flowers, the outside is a fine red, and the inside a light yellow. It is quite hardy in this climate.

On the *China Pink*, Nature has spread some of her finest colors; and seedlings vary much—some single, some double. In Loudon, this species is marked a *biennial*; but we have them three years old with no symptoms of decline. Ours were transplanted, which doubtless increased their radical fibres.

Chelone barbata though a native of Mexico, abides the winter in the open border. Its slender stems, sometimes five feet high, are ornamented with tubular flowers, light scarlet red on the outside, and striped within. It continues in bloom a long time.

The double *white Clematis* from Japan is very showy; but must be covered up from the cold in winter. It is a slender climbing shrub.

Clematis flammula (Virgin's Bower) another climbing shrub, has white flowers, of little splendor, but much fragrance. It is a desirable plant.

Eschscholtzia californica (now altered to *Chryseis*) with large yellow flowers, is already naturalized to the gardens. The orange colored (*C. crocea*) is only a variety, though marked as a species.

Luphrum salicaria and *L. virgatum*, are nearly allied, but the latter is a more slender plant. The flowers are in verticillate spikes, of a red-purple, and both deserve a place.

Spiraea lobata, four or five feet high, a native of the ark openings in the West, presents masses of pale red flowers on the top of its stems. It has been much admired.

Yucca flaccida is one of the finest plants in the border. Its leaves are as green when they project through the snow, as they are in summer. The scape is 3 feet high, crowded with large white flowers; and in its time of bloom, we have nothing more splendid. No other species of *Yucca* that we have tried, agrees so well with our soil and climate.

Aconitum napellus (Wolf's Bane) has rather a lurid appearance, though it has long been considered an ornament of the garden. Another species with white flowers, very tall and erect, makes a fine display.

Stenactis speciosa is nearly allied to the Aster, with large flowers of a light blue, though some varieties are deeper than others. It is showy as its specific name implies.

The *Detroit or Michigan Rose*, which may be trained to the height of twenty feet, is the latest of all that bloom with us at one regular period. Seedlings vary with us, some deeper, some paler; but the flowers of each seedling, also vary in color according to their age. When these first open, the red is more intense, but they become paler with each succeeding day, fading at last almost into white, and as those of the same panicle are not equally forward, the diversity of color is very pleasing. In a hedge where it presents large masses of bloom, it is very splendid. A double variety has already originated, but we know nothing of its merits.

Orchis fimbriata is beautiful, and grows well in a shaded border where vegetable earth abounds. Each plant has one large terminal spike of pink flowers, varying however in the intensity of their colors.

Hydrangea radiata is hardy, though a native of the South; and round the circumference of its cymes are barren white flowers which are elegant. *H. quercifolia* however, from the same region, though more tender, is more showy. It has close panicles of a conical form, six or eight inches in length; while on slender peduncles the barren flowers project all round, so as to nearly encase the fertile flowers. When protected by deep snow until the keenest breath of winter has passed over, it does well. It is now beautifully in bloom.

Centaurea aurea on the top of a strong stem, presents its golden flowers. The heads are nearly two inches in diameter.

The *dwarf Horse chestnut*, spreading wide as it ascends to the height of five feet, and exhibiting its white flowers in long terminal spikes,—if not equal to the Asiatic Horse chestnut in beauty, excels all other species that we have seen. Many of the spikes are a foot or more in length.

Hypericum kalmianum is a sub-evergreen shrub of a round form covering itself with yellow blossoms.—*H. hircinum* from Calabria is tender, and killed to the ground every winter; but assuming the character of a perennial, it springs up three feet in summer, decorated with beautiful flowers. It is strong scented when rubbed or broken.

Silene regia from Ohio, erect, four or five feet high, with several stalks from one root, has blossoms of a glittering scarlet. Nuttall calls it "one of the most splendid species in existence."

Bocconia cordata, six feet high, produces its flowers of a slight blush, in panicles; and makes a fine appearance at a distance. Its leaves greatly resemble those of the Blood Root, and both belong to the same natural order.

The different species of *Liutris*, according to Loudon, are elegant plants. Two of these have come into bloom: one is *L. pumila*, and the other we imported from England without a name.

A species of *Gulardia*, with purple disc and yellow rays, two inches in diameter,—though a straggling plant, is quite showy. It is a perennial.

Funkia carulea (separated from *Hemerocallis*) is the tallest of this new genus that we have seen; and bears its pale purple flowers which are striped, in spikes that terminate the stems, two or three feet high. *F. lanceifolia* is a smaller plant with delicate blossoms of nearly the same color.

There is no finer scarlet than the flowers of *Lobelia cardinalis*. It grows naturally in damp ground near the borders of streams; and if removed to the garden should have a shady spot and deep vegetable soil.

Whoever admires the blue bells of *Campanula rotundifolia* will be pleased with those of *C. carpatia*, which is generally of a finer blue. It comes from the Carpathian mountains.

Coreopsis lanceolata is the most showy species of this genus in odour, since *C. tinctoria* has been removed to Calliopsis. It has beautiful yellow blossoms.

The iron fox glove (*Digitalis ferruginea*) is an old inhabitant of the gardens. Its erect stem, three or four feet high, is crowded with neat flowers, stained as if with iron rust.

Burnt Earth as a Manure.

We have used burnt earth as a manure for several years in our garden, which is a *heavy loam*, with great success. It has been mostly applied to the cabbage, the cauliflower, and the beet; but its effect on the last has been perhaps the most extraordinary. Some of the largest we have ever seen, were manured in this way.

To prepare it:—We have taken knotty logs, such as would be rather unprofitable to split, and laid three or four as a foundation to build on; and as every flower garden furnishes rubbish, we have collected it, and heaped it up as high as it was found convenient to manage. Such materials make rather a loose and elastic pile; but we have endeavored to lay them as compactly as we could; and then have had a man to stand on the top, and receive sods until the mass was pressed down into shape. Any earth that is foul with grass or weeds is thrown on, in the manner of covering a coal-kiln, leaving two holes on opposite sides to cause a draft when it is set on fire. As soon however, as the fire extends through the pile, the holes should be closed, so that no smoke be emitted. Steam will rise from the damp earth, but the smoke should be carefully confined.

We have generally burnt one or two cart-loads of earth at a time, because we were not prepared to burn more; but we presume that much greater quantities might be burned with the same fuel. The heat will continue many weeks, and the earth in the interior of the heap, will become of a brick-red. One or two shovelfuls may be applied to a cabbage, or it may be laid on both sides of a row of beets an inch or two thick. In England, where paring and burning is much practised, it is generally admitted by judicious farmers that *light or sandy soils are unfit for this operation*. Arthur Young says he "found burning injure sand." It can hardly be imagined," says Sir John Sinclair, "that fire would add any thing to the nature of sand, or render it more fertile. No turf that will readily harrow to pieces, ought to be subjected to this process." "All poor siliceous sands," says Sir H. Davy, "must be injured by it. An intelligent farmer told me he had pared and burned a small field several years ago, which he had not been able to bring again into good condition. I examined the spot; the grass was poor and scanty, and the soil an acid siliceous sand.

Sir H. Davy refers the effects of paring and burning "entirely to the diminution of the coherence and tenacity of clays, and to the destruction of inert and useless vegetable matter, and its conversion into manure."

It is doubtful however, if these causes are sufficient to produce such effects. 1. The coherence and tenacity of clays may be reduced by mixing coarse sand without any such increase of fertility. 2. The best soils of our garden abound with vegetable matter, rich of course cannot be inert and useless. 3. The quantity of coal in earth burnt to a brick-red is scarcely perceptible.

Sir H. Davy afterwards however, says, "If the oxide of iron in soils is not saturated with oxygen, oxidation tends to produce its further union with this principle; and hence in burning, the color of clays change to red. *The oxide of iron containing its full portion of oxygen has less attraction for acids than other oxide, and is consequently less likely to be dissolved by any fluid acid in the soil; and it appears in this state to act in the same manner as the earths.*"

Dr. John Davy suggests that a "thin layer of clay may prevent resin water from penetrating deeply and saturating the sub-soil which would be corrected by firing and burning." It is known that all clayey soils are glazed after a heavy shower of rain; and consequently their absorbed power is checked or prevented from acting. Where the burnt earth has been applied to the surface, we have observed that in time of drought the soil was moister than in other places. This observation will not disagree with G. Stafford's remark in the (English) Horticultural Register, that burnt clay seems to be possessed of the medium of holding just sufficient quantity of moisture and no more."

He suggests other causes however, that may contribute to render this manure so valuable: "The burning entirely destroys every species of insect and pernicious weed; and on whole quarters where the process was performed many years ago, I have scarcely observed either slug or snail."

He also thinks that "calcareous matters" in the soil may be converted into lime by the burning.—Our subsoils effervesce with acids: and it would not seem unreasonable to suppose that the soil contains lime in some of its combinations which may be changed to a more fertilizing form by the heat; but he thinks as it may, in England some of the finest effects of firing and burning have been observed on *chalky* soils. Sir J. Sinclair says it is "peculiarly applicable to such lands." He adds, "Mr. Boys of Kent, has given a detailed account of experiments tried on 267 acres, principally consisting of such downs, and when the season proved favorable, with uniform success.—A single crop thus raised, was often equal to the value of the land in its original state."

G. Stafford (already referred to) considers it much *cheaper and better* to burn the earth where a garden has been laid out on a heavy soil, than to cart in sand, lime, and other materials. He throws out a trench six feet wide and three feet deep, fills it with wood, and covers it like a coal-kiln, throwing on earth as the heat increases. He says after twenty-two years' experience, "I have been of opinion that I could add to the mass until it reached the height of ten feet." Several instances are mentioned of the complete success of this method: "A work was completed in a few days that never could have been done, otherwise, in his whole life time—that is, he rendered the soil more prolific; and I have never witnessed better success in crops, than I have done of every crop that has been planted in this composition."

At length, he says: "When I first came to this place, the garden was for the most part, a strong clay. No weather appeared to have a good effect upon it. At the first time it was covered by water; and at another time it was rendered by being too dry. I then commenced firing, and in a few days produced a composition six feet deep, equal if not superior, to any soil in this

country. The clay is rendered as pliable as burnt chalk. Every thing appears to thrive in it. I calculate that the ground so heated, will require no manure for at least four or five years, as every vegetable grew too strong for the first two years."

He thinks the clay there of a superior kind on account of the "calcareous matter" it contains; but we presume not superior to the clays of Western New York.

Silk business in Rochester and its vicinity.

We called yesterday at the house of Mr. Joseph Alleyn, of this city, and were shown about 2 lbs. of sewing silk manufactured by Mr. John Adams and his family, of Adams Basin, in this county, and colored by Mr. Alleyn at his carpet factory. It is of various and beautiful colors, very smooth and glossy and stronger than any imported silk we have ever seen.

Mr. Alleyn has just procured one of Dennis's Silk Spinning and Twisting Machines, which is now in operation in his family, and afforded us much pleasure. Mr. A. has already engaged about 50 bushels of cocoons to manufacture on shares. He informs us that he also intends to connect the business of *silk weaving* with his carpet factory, and has made arrangements for obtaining machinery and a workman from England.

Those who still have doubts respecting the practicability or success of the silk business in this country, will soon have demonstration which must convince the most skeptical. Many families in this and adjacent counties are now engaged in the business, and the results of their labors, when known, will be a matter of astonishment to many.

Mr. Adams has, at our suggestion, given us a brief statement respecting his experience in feeding silk worms, &c., which we are happy to subjoin.

MESSRS. EDITORS.—The past season (1839) we fed, as we supposed, 100,000 worms. The leaves of the white mulberry alone are used by us. During the last stage of the worms, as may well be imagined, we had a hard task to supply so many voracious animals with food. In addition to the labor of my own family, I paid six or eight dollars for hired help. We fed the worms 5 or 6 times a day, which I have since learned was not necessary; and this year we have adopted a different plan, and only feed them 3 times a day. We commenced operations this year early in June, with about 80,000 worms. We have fed all these without any other help than our own family, (consisting of myself and wife and four children, the oldest a lad of 14, the other three, girls,) excepting the assistance of two small boys during two days, when I was preparing bushes for the worms to wind on. On gathering our crop we had 22 bushels of cocoons, which were of a better quality than last year.

We use "Dennis' contra twist Reel;" my wife has reeled 5½ lbs. of silk during the past eight days, besides attending to the usual duties of the family.—With undivided attention she can reel about a pound a day. We think we can calculate on a pound of raw silk from a bushel of cocoons.

Very respectfully yours, &c.,

JOHN ADAMS.

Adams Basin, July 20th.

P. S. Any information which I can give on this subject, shall be freely communicated if desired.

Harvesting Peas.

The time for harvesting peas being now arrived, we would remind farmers that by far the cheapest and most expeditious way is to pull and collect them at one operation, by means of a horse-rake.

For the New Geneva Farmer.

New Kinds of Wheat.

MESSRS. THOMAS & BATEHAM.—In the last number of the Farmer is a communication from W. T. Cuyler, giving an account of the Tuscany Wheat.—He says it stands the winter well, and is considerably earlier than common wheat. In our town, where it was first introduced by Mr. Hanford, the Tuscany wheat has not stood the winters very well, nor has it ripened much if any earlier than the common Flint Wheat. Owing to a part of it being destroyed by the winter, it has usually stood thin on the ground, and to this may in part be attributed its large growth and fine berry. On the 16th of September last, I sowed one peck of the Tuscany Wheat on twenty-one rods of ground. It came up well, but at harvest I found it only stood about half as thick as on a piece of land, of the same size adjoining, where I sowed less than seven quarts of the White Florence Wheat, direct from France. On the same day, and on the same soil, I sowed a piece of the Virginia May Wheat, which ripened about ten days earlier than either of the others. The berry of the Florence is as large and fine as the Tuscany; but as I was fearful that it would not stand the winter, I sowed it too thickly, and in consequence the straw was rather small and short. Those who have examined it are of opinion that it will prove a valuable acquisition to the wheat growers of Western New York; and so will the Tuscany, if it will endure our winters without injury.

Respectfully Yours,

R. HARMON, JR.

Heatland, July, 1840.

REMARKS.—The difference of results in the experiments with the Tuscany Wheat, may be owing to several circumstances. It will be remembered that Mr. Cuyler discovered several varieties among his Tuscany Wheat when he received it from Whentland; some of which stood the winter better than others, and he took pains to separate it. So that the kind he now cultivates may be different from that cultivated by Mr. Harmon, which may be mixed as at first. Or it may be that Mr. Cuyler's land is drier and warmer than Mr. Harmon's, which would cause a difference in the time of ripening, and in the liability to injury by the winter.—Eds.

Larger Calves.

MESSRS. EDITORS.—You can tell Mr. Benj. Chase that I have a Durham Bull Calf, that on the day he was one year old, weighed 920 lbs., and that he was never fed grain; he was fed milk until 4 months 13 days old, after that pasture while it was, and then clover hay, with about 6 quarts of bran per day—in the spring the clover hay was done, and I fed him potatoes in place of bran. But Mr. Wynant Youngmans, of Rensselaer Co. beats us both: his (by the Albany Evening Journal) weighed the day he was one year old 1026 lbs.; mine weighed 21 lbs. more than his when 5 months old. Mr. Chase must try again before he has the largest calf.

Yours, &c.

JOHN JOHNSTON

Seneca Co., near Geneva, 4th July, 1840.

The Cherry Slug.

In our late excursion we noticed the ravages of this insect in Ontario county; and as the chief part of the trees were small, we could not but regret that there was no kind being to throw a handful of ashes over them.

We are inclined to think that the numbers of this insect would not be formidable, if a little care was timely extended; and that they increase rather slowly. Last season only a few appeared in our nursery, and these were promptly destroyed. This season we have not seen more than one or two.

From the Farmers' Register.

On the different proposed Schemes of Rotation.

One of those lucky chances which sometimes occur to the way-faring man, has brought me to-day, *notans volens*, to this place: a place which has been rendered not quite so noted in your journal by the essays of its worthy proprietor, as was Carysbrook of England by the temporary occupancy of Charles, who, if I remember aright, took refuge there from the common-wealth's men. How are the apparent errors of short-sighted mortals turned to good account by a kind Providence! I deplored missing my way as a great evil; but what a treat was in store for me in the sight of this interesting spot! Still more I lamented my fate when I found the landlord was from home! But you and your readers are the gainers by my ill luck, inasmuch that it has produced this *valuable* communication. Nor is it a total loss with me; for the absence has been the means of bringing out in finer relief, the shining merit of his representative, a person bearing the name of the immortal author of the Declaration of Independence, who in his sphere, (the department of butler,) is no less perfect than was his great namesake in the cabinet; and to whom, if Pope said true, equal honor is due:

"Act well your part, there all the honor lies."

Cast my eye around the hall in which I now sit, where are to be seen the appliances of hunting and fishing, it fell upon some of the numbers of your Register, which among other appropriate periodicals, are scattered in careless literary confusion about the room. In the March number I found an essay on "five-field rotation and grazing;" this referred to other communications on the same subject in the February number.

Now, Mr. Editor, my success in the discussion of Jefferson's entabla, has not inspired me with the vanity to pretend to discuss farming matters with these gentlemen. It is true I am a sort of a farmer in a humble way. Having failed at one of the *learned* professions, I betook myself to my present occupation, as a make-shift, hoping that if I failed here too, my errors would be more apt to escape observation.

The first thing that struck my attention in the above-mentioned essays, was the remarkably civil, complimentary style of your tip-top farmers to each other.—I like it much. It is so different from that gasconading, insulting mode of writing practised by politicians; and not in writing only, but in debating too.—I trust the new code of honor which authorizes one man to give another the lie, or charge him with dishonesty, and then to avoid responsibility by averring that he means a political lie, or political dishonesty, will never find acceptance among the agricultural community. Among us, let there be no distinction between an agricultural lie and any other.

But to the point. With all due deference, permit me to state an objection to each of the systems of rotation proposed. To Mr. Carter's, because it appears to be bottomed upon the presumption that the land has become too rich already, and requires depletion, an effect which, it strikes me, the three successive grain crops are well calculated to promote. To Mr. Baxton's, because it leaves the land naked and perfectly idle through one winter, and of course losing ground. I have always thought a spring crop after corn inadmissible for that reason. Besides that, grass sown on oats in the spring of the year is extremely liable to perish under the influence of the summer's sun. To Rivanna's, because without the common, or sixth field, it differs but little from the exploded three-field, or make-shift system. It is true he considers this common *important* to all rotations; but to his it seems indispensable, for where else are your cattle to find sustenance till the 20th June, the day set for the feast? Before that day comes they will have feasted the huzzards. And even with the aid of the common or "short bite," (by the way, if it is a "short bite" in the Green Spring country, what can be expected from "old Flin," or some other places I could name!) they would exhibit in their "unfed sides" demonstration strong against the system; they would sing, in very doleful tones indeed, the old song,

"'Twas on the 21st of June,
In charming summer weather."

Give the three field shift the advantage of a common, and where is the difference? No other than one field of clover instead of two, covering a somewhat smaller portion of your farm, one-third being less than two fifths. I am of Mr. C's opinion, that under Rivanna's system the clover has not imparted to the land all its benefit before it is re-fallowed. It ought to be an object, in a judicious and economical course of husbandry to obtain hay and seed from a clover crop, or at least a part of it. If then one of the two fields is

mowed and seed is gathered from it, it cannot be grazed at all the same year. Only one field therefore is left for grazing, and that between the 20th June and following time—a very "short bite" indeed. It appears to me there should be two clover years in succession—cutting the first, if the crop will bear the scythe, and grazing the second—and two grain years only in succession, which is a four-field course; and if I am allowed the common in the bargain, this is a valuable auxiliary, to enable the pasture field to get a little ahead in the spring, before the stock is put on.

The long and short of the matter is, that systems for all things must be controlled by circumstances.—A system of mental improvements must be adapted to the capacity of the particular mind, so must be a system of agriculture to the qualities of the soil, general condition, and localities of the particular farm. Rivanna, for example, or the author, enjoys the advantage of a very fine meadow, and abundant crops of corn, with a plenty of wheat straw, &c., which afford no small help to the "short bite." By the way, in passing through the front gate, I observed some horses standing with their chins resting on the fence, and looking with longing eyes into the adjoining clover field, and seeming to pray for the advent of the 20th June; and some hogs peering, with optics sharp, through the rails.

In conclusion of these very *erudite* remarks, permit me to say that the present condition of this splendid farm furnishes a refutation of all objections to the management of it. The science of agriculture is here beautifully illustrated, whilst its profits are largely realized.

A TRAVELER.

Carysbrook, May 12, 1840.

From the Farmers' Cabinet.

Dialogue Continued—Cultivation.

Sykes.—Poor Grabb! he's a kind-hearted man, truly; but if his father had not lived before him, and left him at his death, the fine farm which he so miserably manages, he would, by this time, have been in the almshouse. It is a pity, however, that he did not do a little in the way of cultivating his son's *mind* at the same time—his *sub-soil* must be in a wretched state, I guess. Well then, neighbor, my team shall be here by peep of day to-morrow, to join yours, and as I wish to drag, and roll, and harrow, three times in a place, the field designed for turnips, we must make up our mind to stretch a point, and complete it before we leave; and they can then collect the weeds and burn them the next day. My heart aches when I look at the poor widow of an excellent friend, and her bereaved little ones; and I have made up my mind and my vow, if God spares me, to assist her in her trouble, until her fine lad is capable of taking a father's place, and work for his poor mother and sisters.

Father.—My noble friend, I must partake with you in that luxury, and I shall not only be ready and willing, but be glad to meet you at any time with heart and hand!—God bless you—good bye.

Frank.—What a contrast! I think, however, that there must be a difference in the nature of the *tree* as well as the soil—the fruit is so very unlike.

Father.—No doubt there is, but cultivation will always work wonders.

Frank.—How droll to hear Grabb talk of a song! It must be a gloomy one to fit his state of mind; I should like to hear it.

Father.—And so it is—words and tune: it is one of Diddin's happiest efforts; and you must fancy it, sung in the most doleful strains, to a tune in the minor key.

We hipsels, made up of frail clay,
Alas! are the children of sorrow,
And though brisk and merry to-day,
We all may be wretched to-morrow.
For sunshine's succeed by rain,
Then, fearful of life's stormy weather;
Since pleasure can only bring pain,
Let us all be unhappy together.

Frank.—Capital! but how would you reclaim a soil so sour, cold, and sterile, and which produces such crabbed fruit, as that of which Grabb is the similitude!

Father.—Oh nothing is easier or more agreeable: I would remove the soil from about the roots to a good depth and distance, and fill the opening with fresh mould, mixed with a copious supply of lime; prune very close, and leave the event, trusting to the sweetening influence, so beautifully expressed by the Methodist preacher, "lime to a sour, stubborn soil, is like the grace of God to a wicked man's heart."

Frank.—I should like to try the effect of such liming in Grabb's case, for, poor fellow, he is so miserable, that I expect he is as great an object of charity

and commiseration as Mrs. Williams and her poor family—is there nothing that can be done for him?

Father.—I fear not.

Frank.—And yet, you said, cultivation will always work wonders.

Father.—That's good—and so it will; and suppose that I get Sykes to assist us to take him up and carry him, as though he were a *bereaved widow*?

Frank.—Oh, pray do, I will be answerable for him; at present he appears quite friendly and miserable, with a door as well as without—as he says.

No. 9. The rich and healthy surface and poisonous sub-soil. This is an interesting case—shall we take the beautiful Newington Peach tree, which flourished so finely for two years in our garden, and died so prematurely last year? I think we shall find the analogy complete. That fine tree was trained with the greatest care in the nursery, until it was fit for transplanting into the garden, when the soil, a firm, rich, hazel loam, was trenched, and cleaned, and limed for its reception. The first season after its removal, it bore much fine fruit, of the most delicious flavor, and large, handsome appearance, bringing them all to maturity, and perfectly ripening its wood. The next season it bore most abundantly, and made noble shoots, which required no pruning or heading back; its blossoms were remarkably large, and of healthy appearance both fruit and wood were well ripened, and fully testified the care and attention which had been exercised in its culture from the first.

On the appearance of the blossoms next spring, they were observed to be much smaller, and paler in color and although the fruit set well, many fell off when they were the size of pens; and at midsummer, many of the under leaves withered and fell from the branches. Before Michaelmas, the color of the foliage had completely changed; the fruit ceased to grow, and the tree was declared to be infected with the disorder called the *yellows*. The worms had made sad havoc beneath the bark near the ground; nor was it a matter of surprise when, on the opening of the last spring, not bud or blossom made their appearance—the tree was quite dead. On removing it, I was determined, possible, to learn the cause of such premature decay and sudden death, and therefore very carefully removed the earth from about the roots, laying them quite bare without wounding them. All appeared healthy and the soil in the finest condition imaginable, until discovered that a small and tender root had extended itself until it had reached a small oozing of water, of color of the rust of iron, which proved to be the head of a mineral spring of the strongest quality. The small root was decayed for a considerable way toward the body of the tree, and at least three feet from the source of the evil; and this was no doubt the cause of the disease and death of the finest tree I ever saw.

Frank.—How very strange, that so trifling a circumstance as the point of a small root reaching a little water at such a distance from the tree, should be the cause of such sudden destruction.

Father.—It is; but to show you how certainly it was the cause, I will copy from our favorite Tull account of some useful experiments which he made expressly with the view of showing the truth of the position, that vegetables will take up and circulate indiscriminately, the most deleterious, as well as the most wholesome substances; and that they often do their destruction.

Exp. 1. "I put a mint stock into a glass of water but I immersed *one string* of its roots, being brought over the top of that glass into another glass of salt water, contiguous to the top of the other glass—the mint very soon died.

Exp. 2. I put the upper root of another root into a small glass of ink—this root was also killed by some of the ink ingredients.

Exp. 3. I made a very strong liquor with water and the bruised seed of the garlic, and placed the top of it close to the top of another glass, having in it a plant, two or three of whose upper roots put into the stinking liquor, and there remaining—it killed the mint in some time; and when the edge of the leaf of the mint began to change color, I chewed many of them in my mouth, and found at first the strong flavor of the mint, but that was soon over, and then the nauseous taste of the garlic was soon perceptible."

You see, how readily plants, whose roots reach to a poisonous sub-soil, imbibe and circulate the deleterious matter to their destruction. I once grew some turnips on land having a wet sub-soil, and on storing them for winter use, I observed that the point of the top-root of every one was decayed; but as that was near the bulb, I did not consider the circumstance any consequence. On opening the pit in the winter, however, I found that three parts of them were rotted.

the stench arising from them had infected the remainder, so that the cattle refused to eat them.

Frank.—How satisfactorily you have accounted for the decay and death of our favorite tree! what a pity at you could not have ascertained the cause during its life time, as it might so easily have been prevented, by dividing that small root from the body of the tree!

Father.—Truly; but the lesson has not been lost upon us, for you know that I have recovered many oaks that have been infected with the yellows and orms, by trenching and dressing the water with me, and removing the bad soil from amongst the roots. And now, do you know any young and promising individual, whose untimely death might be likened to the decay and death of our favorite tree?

Frank.—Yes, Henry Templeton.
Father.—Exactly—of an excellent and highly-respected family, he was the brightest hope—an only son—with a mind and body cast in beauty's mould, he was truly "the observed of all observers;" even in a nursery his education had commenced; and the wisdom displayed by his amiable parents in this particular, was crowned with perfect success. His youth was spent in acquiring knowledge of the most useful and valuable kinds; and the commencement of his public life, which might be compared to the planting of our tree from the nursery, was hailed by his friends with the brightest expectations. We well know the esteem and respect which he won from all who knew him, while his gentle and amiable, and refined manners were the admiration of every one. I remember the time when he commenced the study of the law under counsellor S., and how fortunate his family considered him in the choice of his fellow-student, Charles E., as his particular friend—alas! that very circumstance proved the total ruin of him, and the hopes of his family: for Charles E. was a young man addicted to every species of vice and wickedness, and possessed of the most consummate hypocrisy!—one fatal evening he prevailed upon Henry to accompany him to the gaming-table, and his destruction was sealed.

In a short year from this time he returned to his father's house, an emaciated being—his health destroyed, his mind frenzied, and in the last stage of consumption, only to sigh out his soul in penitence in the arms of his broken-hearted parents and sisters! Poor Henry Templeton! one small root penetrating to the root of the subsoil, was the cause of indescribable suffering, misery, remorse, anguish, and death to himself, and distress unspeakable to his tenderly attached family, and a numerous circle of young and much-loved friends.

Frank.—Poor Henry Templeton! who would have thought that we could find so true a portrait of him in our beautiful and unfortunate peach tree!

Father.—But here is one more soil for examination. No. 10 It is, to appearance, a happy mixture, and the highest state of cultivation; but the tree which planted in it makes no progress. It is not diseased, it can scarcely be called healthy; it blossoms in season, but does not seem to put forth energy sufficient to bring its fruit to perfection; and although when presented it is fair to the eye, it has little flavor, and soon withers. Its shoots are not deformed, nor do they require much pruning; but the foliage has a weak and faded appearance, although it cannot be denominated sickly. Its bark is thin and clean; and its foliage does not fall or change color prematurely, but it makes no progress—there is no strength in its growth, and there is no sensible defect—an ornamental tree, but of very little value, although of the choicest fruit-bearing species.

Frank.—Why, what can be the matter with the soil then?

Father.—Nothing—the matter is in the soil, which has been too highly manured, and made light and porous by such frequent dressings—in fact this tree ought to be compared to a rich, indolent, unemployed young man, eaten up with *ennui*! no disease, but no strength—no pain, but no pleasure—with energy sufficient to put forth a blossom, but not enough to bring it to perfection—no fear of dying, but no hope of living—blameless, but praiseless—does no harm, nor any good, and may as well be dead as alive!

Frank.—Well, I would not be a gentleman if I could, at how would you set about curing such a nameless disease?

Father.—I would try it with affliction. I would cut the ground about the roots, amputate some of them, and mix clay and lime with fresh strong loam to fill in; and then I would prune close and hard, rounding the branches pretty close to the body of the tree, and await the result with confidence.

Frank.—Well, these would be pretty hard lines, as Grubb says.

Father.—Yes, but I have known many such characters who had abundant cause to exclaim, "It is good for me that I have been afflicted." You know there is the son of old Judge Thomson, who, while his wealth remained with him, has often complained of the trouble of eating, and could not bear the idea of walking abroad, even on the score of health; was charitably disposed, but could not prevail upon himself to use the least exertion, even were it to save a fellow creature from starving: it is even said, that, when in a passion with his servants, he has declared that he would kick them if it were not so much trouble!—But the fire which destroyed his wealth, purified and sanctified his soul;—he is now happy because he is industrious; cheerful because usefully employed; and finds it no painful exertion to walk miles to render assistance to a suffering neighbor. He is now rich in good works and sound bodily health; and often exclaims "It is good for me that I have been afflicted!"

Let us close by reading Dr. Drennan's beautiful hymn,

THE FRUITS OF BENEVOLENCE.

The husbandman goes forth a-field,
What hopes his heart expand!
What calm delight his labors yield,
A harvest from his hand!

The nobler husbandry of mind,
And culture of the heart—
Shall such with men less favor find?
Less genuine joy impart?

Ah! no—your goodness strikes a root,
Which dies not, nor decays;
And future life shall yield the fruit,
That blossoms now, in praise.

The youthful hopes, which now expand
Their green and tender leaves,
Shall spread a plenty o'er the land,
In rich and yellow sheaves.

Thus, a small bounty well bestow'd
May perfect heaven's high plan;
First daughter to the love of God,
Is charity to man.

'Tis he, who scatters blessings round,
Adores his Maker best!
His walk through life is mercy-crowned,
His bed of death is peace.

J. P.

Blinders upon Horses.

Is there any real use in having blinds or blinders upon the bridles of carriage horses? We doubt exceedingly if there need be, provided, nevertheless, as the lawyers say, the horses are trained as they ought to be in the beginning. We have known borses that would travel as well without as with them, and we believe much better. We have no doubt that nine-tenths of the springing and starting of horses upon the road is owing to their being hood winked with those pads over their eyes, leaving only a small space to peep out, and that too not in the direction of true vision. Objects cannot appear distinct and natural when thus seen, and what wonder is it if they start when they discover what to them appears, in consequence of the indistinctness with which it is seen, some strange monster. Horses will run day after day in the pasture among rocks and stumps, without betraying the least fear, but when in harness will "sby" whenever they pass by one of those same rocks and stumps. Sometimes we meet with a horse that is partially blind or near sighted, and these almost invariably start and are skittish. Instead of "blinders," such horses should have nothing over their eyes, or spectacles to improve their optics. There are many other improvements to be made upon harness.

We load horses too much with trappings. One quarter of the expense is incurred for useless straps and buckles and buttons. The more light and simple harness can be made compatible with strength and real use the better it is, and the more ornamental it will be. We need all the strength of the horse to draw the load, instead of bearing up a useless burden of leather and metal.—Maine Farmer.

Preserving Green Peas.

Now is the time for those who like a good thing in the winter, to lay up a store of green peas. If shelled and put into a dry bottle and corked perfectly tight, (sealed,) they may be kept until winter with ease.—They should be cooked as soon as the bottle is opened, as they will not keep well after the air comes to them.

We have been told by a person who has traveled in Germany, that the Germans preserve green peas by shelling them and putting them into a pickle made of salt and water. In the winter they are taken out, soaked until fresh, and cooked. Beans in the pod are also preserved, pods and all, by cutting them into pieces and pickling them in the same way.—Ib.

Rain.

The largest drops of rain, which are about one fifth of an inch in diameter, will fall 2,000 feet in a minute; but the ordinary drops in this climate will seldom fall half so fast. Hail-stones in the south of Europe, having sometimes the enormous diameter of two inches, will fall with a velocity of 118½ feet in a second, or more than a mile and a quarter in a minute; a rapidity of stroke which destroys corn-fields and ravages vineyards.

The Mahogany Tree in St. Domingo, is tall, straight and beautiful, with red flowers, and oval lemon sized fruit. When the tree grows on a barren soil, the grain of this wood is beautifully variegated—upon rich ground it is pale, open, and of little value.

It is stated by the Mayor of Boston, that one-fifth of the taxation of the city goes to the public schools.

Rural Melodies.

BY BEN BARLEYCORN.

Say, do you love the music of the farm,
Sweet melodies of nature, that can charm
The very soul—ay, hold control
O'er all the feeling, and to man impart
The best affections of a grateful heart?

Then come with me: list to the cheerful songs,
The coral anthems of the feather'd throngs.
We hear the lay—from every spray,
Along the hill-tops—o'er the flowery lawn,
And merry music hails the breaking dawn!

Up mounts the curlew, trilling through the air;
And hark! we hear the cherry lark, too, there.
The soaring kite—in giddy height,
Sends forth his piercing note, loud, shrill, and clear,
And cackling fowls to covert scud with fear.

The solitary cat-bird and the thrush,
On towering pine or shady alder bush,
Now strain their throats—in comic notes;
While on the osier bough or midst the fern,
The black-bird and the sparrow sing in turn.

Sweet robin; now from yon old apple tree,
Thou warblest forth thy song most merrily!
From morn to night—'tis thy delight,
Thy fond, endeared and sitting mate to please
And entertain with thy own melodies.

Like jingling school-bell, screams the noisy jay,
As off she flies far to the copse away.
The whistling quails—athwart the vale,
Call out *Bob White!* then skulks along the glen,
Avoiding all society with men.

The blue-bird, goldfinch, martin, swallow, wren,
The carolers of forest, field and fen,
Sweet turtle dove—who sings of love,
The twilight minstrel too, lone whip-poor-will,
These with their concertos the hamlet fill.

But there is one whose note out-does the whole,
'Tis so diverting and so very droll;
Pert bob-a-link—I hear thy tink,
Alla-capella-cantabile-chickpea-nibble-O-nibble-
O-tintinnulato-cheerily-cheerily-sweet!
What bird in jargon can with thee compete?

Here herds are lowing, there the sporting lambs
Are frisking gay, or bleating for their dams.
The rampant hounds—pursue their rounds;
Their yelping music makes the welkin ring,
And frightened conies to their couches spring.

The torrent rumbles down its rugged way,
And streamslets murmur thro' the blooming lay.
The wavy trees—creak to the breeze
That hums concordant on, o'er plain and hill,
And in its course revolves the rattling mill.

Come now, ye Metropolitans with me
Enjoy the sweets of rural minstrelsy;
In vain ye show—what art may do,
Your Woods, and Knights, and Russels, all must yield
The palm to these sweet songsters of the field.

Yaskee Farmer.

For the New Genesee Farmer.

Reply to Annette, on Female Education.

MR. EDITOR—I noticed in your last, some remarks from Annette, on the "Mis-education of Farmers' Daughters," and having been myself a farmer's daughter, and a member of one of the oldest Institutions in the State three years, I feel unwilling to have all the ignorance of a vain and indolent school-girl attributed either to the "system of education," or the "mode of teaching;" and I believe, could the record be given for the last ten years of the female seminaries in Canandaigua, Geneva, Albany, and Troy, (which are among the oldest institutions in the State, and commonly have the appellation of "Fashionable Boarding School" attached to them,) it would invariably be, that, "like mother, like child." Young ladies do not go to these institutions to receive their first impressions; they seldom enter until their habits and dispositions are formed; and instead of affirming that the "whole system of popular female education is conducted with reference to display rather than utility, and is exactly calculated to create a taste for the empty show and false pleasure of a city," she would be surprised to see these teachers weary themselves, early and late, to counteract the influence of the last injunction of an injudicious, uneducated, but wealthy mother. "Madam, pay particular attention to her manners" is never forgotten, while it is seldom suggested that her mind may be neglected; and one would suppose that the adage "Knowledge is power," had been changed in her cradle, for "wealth is power;" and her Cameo's, Mosaic's, Watch, Gold Pencil, and Finger Rings, are to her sufficient recommendations, and she considers herself the "true nobility" of the school; and if informed it is against the rules to wear ornaments every day, the reply is at once offered, "Ma' wished me to wear them every day." If reproved for her idleness, "Ma' never wished me to study History, she always said I could read that at home with her—and mathematics will never do me any good.—I am not going to teach." There is no school but what has more or less of this class of young ladies in it; but they seldom remain more than six months, or a year, in which time they have received their "liberal and fashionable education," while, in truth, they have not learned the alphabet of their own ignorance. Who would apply the term "liberally educated" to a gentleman who had been six months or a year in college? and no one would have the vanity to think that a lady could accomplish more than a gentleman.

To say of these institutions "they pretend to teach many of the natural sciences, but they are taught in such a superficial, uninteresting manner, that they fail of producing their proper influence on the mind, and that a mere smattering of these sciences is deemed sufficient," is as untrue as it is unkind, and however superficial I may be in Mathematics, Metaphysics, or the Natural Sciences, it is no fault of any teacher, or "system of teaching;" and no young lady, with sufficient time, a tolerable ambition, and a proper stimulus from home, can come from any one of the above institutions with these false notions of education. It is no matter whether they are Merchants', Lawyers', or Farmers' daughters; if they go to improve, they will improve; and just what they aim to be, they will be. If they go "to get the polish," they return home with a borrowed garment of politeness; but return as they went, "unfitted for any station in life," and of course, "discontented and unhappy," while the happiness of the truly educated lady consists in making herself useful, and that too in her own home, whether in the city or in the country. It is also incongruous to suppose that the "liberally educated lady should get tired of the country;" and the swarms of rural life,

or reject the addresses of real merit, "for some heartless city fop;" it shows the want of education, not the effect of it; and if Annette wishes a reformation in the present system of education, she could not do it more effectually than to reform the mothers at home.

FANNY.

Walnut Grove, July 18, 1840.

Remarks.—We give Fanny a cordial welcome to a place in our columns. She wields an able pen, and we hope to hear from her again. While Annette perceived the existence of a great and spreading evil in society, and partly discovered its source; Fanny has traced it to the fountain, and we hope she will not leave it, till more has been done to check its bitter waters.—Eds.

The Horse Thistle.

The common horse thistle, like other large weeds, chokes and excludes better things, or robs them of their nourishment; and in meadows and wheat fields, sometimes increases the damage by detaining the hay-maker and the binder, who have to stop and throw it out. A very little care however, is sufficient to keep it within moderate limits. About the time it is coming into flower, a side stroke from the common hoe, will break the stalk from the root, and it never sprouts afterwards. Pastures may thus be kept in order by an annual visit; and if none go to seed on the ground, the stock will soon run out. Perhaps indeed, a few visitors may come floating on the wind from the fields of a careless neighbor; but these, in most cases, will be so few in number, that a breakfast spell would give a good account of them in any pasture of moderate size.

We are the more earnest on this subject, because these intruders, making no noise, come in almost without observation; but let such as gabble or squeal venture there without any right, though probably doing less injury, and they are ejected without delay. This is right; but farmers should be consistent, and drive out the destroyers of their crops, whether they stand on four legs, on two legs, or on no legs at all. †

For the New Genesee Farmer.

Breaking Steers.

MESSENGERS EDITORS.—I agree with the remarks of your correspondent C***, in your last paper, that Steers should be treated with "gentleness and kindness;" but, with all due deference to his opinion, I must say I do not think that swinging a yoke around the neck of a steer, and letting him run frightened and bellowing about the yard till he is "somewhat subdued," is very "discreet management" or kind and gentle treatment.

I will therefore briefly state what I consider "the more excellent way." Let the steers be confined singly in a strong and convenient yard—then with a suitable whip (say 6 feet in length, with a short lash attached) teach the steer to be drove. None but gentle means are requisite. A skilful and patient use of the whip and voice will overcome all obstacles, and in ordinary cases, a few hours is sufficient to teach him to be driven at pleasure about the yard. His mate may then be taught in the same manner. This will probably be sufficient for once, and the business may be resumed at intervals until they can be driven singly or side by side, and turned either way with perfect ease. This treatment will render the steers more kind and gentle, until they will seem as well pleased with the exercise as their owner is with their improvement. Then, and not till then, the yoke may be put on, and after a little more practice light loads should be attached, to teach them to draw, and the work is done. This is my method of breaking steers by kindness. They are not often sulky if treated in this manner—much more frequently refractory. In such cases nothing is wanting but a little more time and more

patience on the part of the driver. If the cattle are kept gentle, as they always should be by kind treatment, two pairs are usually broke in three days, and in this manner will stay broke. R.

Madison Co., July 15th, 1840.

ERRATA.—P. 97, 2d col., line 26 from bottom, for "rusty from disease," read "musty from disease." P. 104, 1st col., line 6 from top, for "absurd to suppose," read, absurd as to suppose. The third paragraph on "lightning rods," p. 104 should not be quoted.

Seed Buckwheat for sale at the Seed Store by M. B. BATEHAM.

NEW BOOKS.

CHILD'S work on Beet Sugar; Buel's Farmers' Companion; the American Swine Breeder's Companion; Bridgeman's Gardener, new edition; and a fresh supply of sundry other valuable books, for sale at the Seed Store. M. B. BATEHAM.

June 1st, 1-10.

OLD GENESEE FARMER,

BOUND Vols., 1st. and 4th, may be had at \$1 per vol. Swine Breeder, or a treatise on fattening swine. For sale by D. HOYT, 6, State-st. Rochester. May 22.

VOLUMES WANTED.

A high price will be paid for several copies of vols. 3, 5, 8 and 9 of the Weekly Genesee Farmer. July 1st, 1-10. M. B. BATEHAM.

PORTABLE THRASHING MACHINES.

CLOVER MACHINES AND HORSE POWERS.

WARRANTED to be thoroughly built and to work well; made by THOMAS D. BURRILL, Geneva, Ontario Co., N. Y.

These machines have all been warranted "to be thoroughly built, and to work well;" and they have fully sustained that warranty. They have gone largely into use; more than four thousand are in operation; many of them have thrashed from ten to twenty thousand bushels each, without repairs. More than eight hundred new machines were sold during the last season; and on thorough trial, they have been recommended by those who use them "to be as complete, and to work as well as any in the world."

His new Combination Machine separates the grain from the straw in the process of thrashing, without any additional machinery; saves the labor of one hand in raking away the straw—much grain which is usually raked off with the straw—and is driven with less power than any other machine in use. Geneva, June 27, 1-10.

ROCHESTER PRICES CURRENT.

CORRECTED FOR

THE NEW GENESEE FARMER, AUGUST 2, 1840.

Table with 2 columns: Commodity and Price. Includes items like WHEAT, CORN, OATS, BARLEY, RYE, PEAS, BEANS, POTATOES, APPLES, CIDER, FLOUR, SALT, PORK, BEEF, EGGS, BUTTER, CHEESE, LARD, TALLOW, HIDES, SHEEP SKINS, WOOL, PEARL ASHES, POT, HAY, GRASS SEED, CLOVER, FLAX, PLASTER.

LONDON, July 3.—Harvest Prospects.—The wheat is now it full bloom, and nothing could have been better for it than the weather for the last week or ten days.

Flour in London 2s. in bond, and in Liverpool 21s. & 20s. General average price of wheat for the week ending June 30, 67s. 11. Aggregate average of last six weeks, 67s. 9d.—Duty 1s. 8d.

Liverpool, July 3.—Flour in London has advanced to 20s. 6d a 25s. 3d. per bbl.—at which about 5000 bbls. have sold to-day

PUBLISHERS' NOTICES.

Some should Read this.

Some of our friends have promptly responded to the call which we made last month respecting remittances—these have our thanks. But our books show that there are several hundred dollars yet due us from agents and Postmasters. This is too bad, it is not just; it is not honest! We make no profit on the publication, and if all that is now due was promptly paid, we should not save a dollar for our services.—We do not mean to be harsh, or complain without reason, but there is a point beyond which forbearance ceases to be a virtue. The harvest is now over, and money begins to circulate among farmers; so that we hope soon, not only to receive what is now due, but also a large amount of new subscriptions. Our friends will not slight this call.

Now is the Time.—Many of our friends promised to obtain a number of new subscribers as soon as farmers sold their wheat and got a little money. We hope they will not forget this, about these times; and we would remind them that it will save trouble if they will pay for two years at once—it is only one dollar, and another year is fast drawing near.

Acknowledgements.—Our thanks are due to the officers of the Midland District and the Niagara District Agricultural Societies, in Upper Canada, for their liberal orders for this paper. We hope they will be greatly benefitted thereby, and that other Societies will soon follow their examples.

Will the Secretaries inform us how the papers are to be sent?

The Cattle Show and Fair at Rochester.

The farmers generally in this region manifest much interest in the coming fair, and we confidently anticipate that it will be highly useful and interesting. All who can, should bring something to exhibit, not however for the purpose of obtaining the premiums, but to give interest to the meeting and advance the cause of agriculture. We are happy to inform our readers that the principal breeders and owners of fine stock in this county have promised to bring their animals, so that all may be assured there will be a good display.

The second day is intended chiefly for the sale and exchange of farm stock, and all who wish to purchase or sell fine animals will do well to be present. Suitable arrangements will be made respecting pens, pasture, stabling, &c.

The Ploughing Match.

By the liberality of the Ploughmakers of this city, three improved ploughs, of different patents, will be given as prizes for the best ploughing; the person entitled to the first prize, to have the first choice. Horse teams only are to be used, without drivers, each to plough one quarter of an acre. A field of greensward will be obtained for this purpose near the city. Ploughmen who intend to compete are requested to leave their names at the Seed Store a few days before the Fair.

A Correction.—In the list of articles for premiums published last month, on page 128, the 23d and 24th premiums should read for pigs not more than 9 months old; instead of "7 months old."

A Meeting of the Executive Committee

Of the Genesee Agricultural Society, will be held at the Arcade House, Rochester, on Saturday, the 12th of September, at 11 o'clock, A. M., to appoint committees, and make arrangements for the coming Fair. A full attendance is very desirable.

Canadian Visitors.

The following letter from the Hon. Adam Fergusson, was intended as a private communication; but knowing that it will have a good effect we take the liberty to publish it.

WOODHILL, WATERDOWNS, U. C. }
August 22, 1840. }

DEAR SIR—I observe with some interest the announcement of an Agricultural Show and Fair to be held at Rochester on the 7th of October; and if we thought we should be welcome guests I think some of our farmers would feel inclined to take a trip over and see your Genesee stock.

What would the chance be of selling my Bull, May Duke, at the Fair? I have also a thorough-bred yearling Bull which I might perhaps send—Pray let me hear from you at your earliest convenience.

Yours truly, ADAM FERGUSSON.

Reply.—We are gratified to learn, from various sources, that many of our Canadian neighbors manifest considerable interest in our coming Fair, and we have reason to hope that a number of them will honor us with a visit at that time. We can with confidence assure them that their presence would be most welcome to the farmers of Genesee, and if we do not make their visit profitable to them, we will at least try to make it pleasant.

Respecting the sale of animals, we had rather invite our distant friends here to purchase than to sell; but at the same time we think it highly probable that Mr. Fergusson could sell those he mentions, to good

advantage. We know them to be of a high order of excellence, and should be pleased to see them at the Fair; but whether it would be advisable to drive or transport them so far, we are at a loss to decide.—Eds.

Large Peaches.

We have not had as fine a season for fruit in five years past as the present. The warm weather of late has greatly benefitted the Peaches, and they are now ripening in great abundance and of excellent quality. Mr. E. D. Smith has exhibited some of the Royal Kensington variety measuring over nine inches in circumference. Mr. E. Watts and several other persons have raised them nearly as large. But the largest and best peach that we have seen or heard of this year was a yellow malacaton fully ripe from the garden of T. B. Hamilton, Esq. which measured nine inches and three quarters in circumference. Mr. Ira Carpenter, brought us a pine-apple clingstone of the same size as the preceding, but not fully ripe, from the garden of Mr. Howe.—August 31st.

Attention Readers!—We flatter ourselves that the New Genesee Farmer is not often thrown aside without being generally read; but for fear that some of our readers are in the habit of laying it by for a rainy day, we would remind them that our monthly messenger always contains some valuable information expressly adapted to the season, and therefore it should be read without much delay. The article by Mr. Fergusson in this and our last number, will be found interesting to farmers in this country as well as Upper Canada.

English News.

The steam ship PRESIDENT at New York, brings dates from England to the first, and the ACADIA at Boston, to the 4th ult. This last vessel made her trip in the remarkable short space of 12½ days.

The Cotton Market was active and firm at fair quotations. A considerable revival had taken place in the export of manufactured goods in this country. The President has brought out 1300 packages.

The crops of grain were uncertain, as the weather had been very unpropitious; but the Mark Lane Express of the 3d inst. says, "the weather has during the past week been decidedly auspicious, and advices from all parts of the country, represent the outstanding crops as having been greatly improved within the last ten days."

The following is an extract of a letter received in Philadelphia, dated

"LIVERPOOL, August 3.—The weather for July has been most unfavorable, and threatened the destruction of the harvest. It has however, latterly looked up, and the present indications are that it may yet be saved; however, there will not now be an average crop. The consequences, had we been compelled to send our gold to the continent for grain, would have been disastrous. Money, now easy, would have become tight; confidence been shaken; probably failures have ensued, and the prospects of several in commerce, blasted. As it is, I trust that the deficiency of our crops will be amply supplied from America; and then, I have no doubt, there will be a good spring trade, and cotton rise before Christmas. I send a circular, from which you will see that although there is an excess of import of 300,000 bales, the stock is less than at this date 1839, by 20,000. This exemplifies at once, the effect of low prices upon the consumption. Our grain market is dull. The funds have been materially affected by some statements in the French papers, of dissatisfaction on the part of France, at our conduct about Egypt and Turkey. The impression is that it is a stock-jobbing affair."

How.—The mercury stood at 91 in the shade, at Rochester, on Wednesday the 19th ult.

Koller on Insects.

We have examined this valuable production with much satisfaction. Any work having any pretensions to accuracy or ability, on insects injurious to the farmer or gardener, cannot fail of great utility; particularly valuable, therefore, must be one written with the care and precision of the book before us.

This work was prepared by a committee of the Royal and Imperial Agricultural Society of Vienna, with the authority and direction of the Austrian government. It is translated from the German by Jane and Mary Loudon, and contains many valuable notes by J. O. Westwood, Secretary to the British Entomological Society.

The study of Entomology has received hitherto but little attention in this country; probably a tenth part of the insects of the United States have never been described. Destructive insects, especially, are very imperfectly known. It would doubtless be of great advantage to the agriculture of our State, could the labors of the State Zoologist be directed to an examination of the manners and habits of those insects more particularly which have proved destructive to the farming interests. Although the work before us describes European insects, yet from their similarity, and sometimes identity with the insects of our own country, it would prove a very important assistant in all investigations of the habits of this destructive class of animals. We hope its republication in this country will soon be called for; and in the meantime we propose to lay before our readers a few extracts, which we doubt not will prove acceptable.

The following introductory remarks, contain much in little space, and will be interesting to those unacquainted with the study.

"Insects are animals which have a body consisting of one or more divisions, articulated feet, a head conspicuously distinct from the body, on which are placed two movable horns, called antennae. They breathe through air holes, which are situated on the sides of the body; the greater number have wings in their perfect state, and only a proportionately small number are without them. With the exception of certain groups, all insects have six feet, and their bodies are divided into a head, thorax, and abdomen, by notches or incisions; hence the name *insect* is derived from the Latin word *insecare*, to cut or notch. Before they attain their perfect state, they are subject to various transformations, which are called metamorphoses."

After a perspicuous description of the orders, are the following remarks on transformation.

"The greater number of insects properly so called, with the exception of some without wings, change their form several times during their life in so striking a manner, that a person unacquainted with entomology would be inclined to consider one and the same insect, in different periods of its existence, as so many entirely different animals.

"To the farmer, gardener, or forester, the knowledge of the transformation of insects is of the greatest importance, as without it he beholds his greatest enemies, without having the means of defence or mode of attack, and neglects the most suitable for their greatest possible diminution, or entire extirpation, from the want of knowledge.

"Insects, in general are produced from eggs; a few species alone, in which the eggs are developed in the body of the mother, are viviparous; for example the aphid.

"The female lays her eggs, which are often stuck on and covered with a sort of glue, to preserve them from the weather, shortly after pairing, instinctively in the place best adapted to their development, and which offers the proper food for the forthcoming brood. The white-thorn butterfly, and the golden-tail moth, lay their eggs on the leaves of fruit trees or other leafy trees, and the latter covers them over with a gold-colored covering of silk. The common lackey-moth (*Gastropacha (Bombyx) neustria*) fastens them in the form of a ring round the stem of the fruit trees; and the gipsy-moth (*Bombyx dispar*) fastens them

in a broad patch on the stem of the tree or paling, and covers them with a thick coating of hair. The winter moth (*Geometa heamata*) lays them singly on the buds of the leaves and flowers; the printer beetle (*Bostriehus typographus*) introduces them between the bark and the albumen, &c.

"Most insects are developed from the eggs in the shape of worms, which are called larva. The larva of butterfly, which are always provided with feet, are called caterpillars; those of beetles and other insects larva; and when they have no feet the latter are called grubs or maggots. The larva state is the period of feeding, and at this period insects are usually the destructive enemies of other productions of nature, and objects of persecution to farmers, gardeners, and foresters.

"The nymph or pupa state succeeds that of larva. In this state insects for the most part take no nourishment with the exception of grasshoppers, cicadas, and crickets, which vary but little in form from the larva, and repose in a death-like slumber.

"After a certain period, which is fixed in every species of insects, and which can either be hastened or retarded according to circumstances, the perfect insect appears from the pupa. It is incumbent on the perfect insect to propagate its species, therefore the organs for this purpose are only perfected at this period of their lives."

From an interesting section on the food of insects, we have room for the following brief extracts only.

"Insects, like other animals, derive their nourishment from the vegetable and animal kingdoms; but a glance is sufficient to show, that they possess a much wider field of operations than the others.

"While the other animals make use for their subsistence of only a small portion of the inexhaustible treasures of the vegetable kingdom, and reject the rest as insipid or noxious, the insects leave perhaps no vegetable production untouched. From the majestic oak to the invisible fungus, or the insignificant wall-moss, the whole race of plants is a stupendous meal, to which the insects sit down as guests. Even those plants which are highly poisonous and nauseating to other animals, are not refused by them.

"But this is not yet all. The largest plant-consuming animals are usually limited to leaves, seed, and stalks; not so insects, to the various families of which every part of a plant yields suitable provender. Some which live under the earth, attack roots; others choose the stem and branches, a third division live on the leaves, a fourth prefers the flowers, while a fifth selects the fruit or seed.

"Even here a still further selection takes place.—Of those which feed on the roots, stem, and branches, some species eat only the rind, like the bee-hawk-moth; others the inner bark and the albumen, like the *Tortrix Hiberniana*; a third division penetrates into the heart of the solid wood, like the goat moth and the family of the long-horned beetles (*Cerambycidae*).

"Of those which prefer foliage, some take nothing but juice out of the veins (aphides); others devour only the substance of the leaves without touching the epidermis (*mining caterpillars*); others only the upper or under surface of the leaves (many leaf rollers); while a fourth division devour the whole substance of the leaf (the larva of *Lepidopteros* insects)."

"Many insects are very gluttonous, and often consume more food in a day than is equal to the weight of their bodies. Thus, the maggot of the flesh-fly, according to Redi, becomes 200 times heavier in the course of twenty-four hours. Caterpillars digest in one day from one-third to one-fourth of their weight; and hence it is apparent that a comparatively small number of caterpillars can entirely strip a tree in a few days."

We purpose, in our next, to give a number of notices and descriptions of individual insects which have proved destructive to cultivators. Nineteen-twentieths of the book are occupied with these, many with excellent accompanying wood-cuts; and the descriptions of those common to both hemispheres, will of course be equally valuable here and in Europe.

The Drag-Roller.

In another column we have mentioned the Drag-roller. It was invented a few years ago by Thomas B. Gay, a farmer of Goochland county, Virginia; and consists of a log six or seven feet long which is drawn or dragged side foremost over the ground. The log should be at least eighteen inches in diameter, and all

the better if it is three feet,—as it will run easier, do the work quite as well, and be less liable to clog by gathering the clods before it. It is most conveniently made of a hollow log split in two; but if a solid log is used, it may also be split in two, and rendered still lighter if necessary, by hewing it away on the upper and hinder side.

Two methods of rigging it, have been employed. Thomas S. Pleasants who first described it in the fifth volume of the Genesee Farmer says, "Two pieces of scantling introduced *obliquely* by mortise and tenon at suitable distances from the ends of the log, and made fast to each other opposite the middle, completes the fixture." Another plan is to fix two strong bars square across the log, and connect them by mortises with the ends of a third piece in front of the roller, to which the team is to be attached. This method has been approved by James M. Garnet, President of the Fredericksburgh Agricultural Society. Both we presume are very efficient; and any man that can handle an auger and chisel may make one.

The latter says, "The superiority of this very simple and cheap contrivance over any implement yet used for pulverizing ploughed land, none can easily conceive, who has not seen it tried;" and the former says, "I can attest from my own experience that it is not only a convenient but frequently an indispensable agent in reducing rough or cloddy ground. The most stubborn piece of land, may by one, or at most by two operations, be pulverized more completely than by double or treble the number of ploughings. The first application should be made immediately after the land is turned over—that is to say, all land ploughed during the day, should be subjected to the operation in the afternoon."

Applying Fresh Manure.

Last spring we had no ground for Mangel-Wurzel so suitable as some that had been in corn for two years; but which was too much exhausted for a root crop without manure. We had none but fresh manure, however, and Judge Peters had recorded his opinion that to this crop "fresh dung is decidedly hostile." Besides our old friend of the Erie co. Nursery, had condemned it not less decidedly. What was to be done? Next winter and spring, we knew our milk cows would suffer unless they had beets; and that we should suffer also, by the diminished products of the dairy. So having some doubt if these writers had conducted their experiments in the best manner, we determined to use such manure as we had; and we can now announce that our success has been eminent. We have not seen a more promising display of beets in any field in the country.

We proceeded as follows: Double furrows were turned outwards at proper distances throughout the lot; and into these the manure was thrown down by forkfuls, touching one another the whole length of the row. The harrow then passed over each row about four times, tearing the manure to pieces, and mixing it with the soil. When this was done, two furrows were turned together over it; and the harrow passing along twice more, mixed it still further, and left the ground moderately smooth.

A line was stretched on each row; and without any further preparation, the seed which had been *scalded*, was dropped. The line remained on the ground till the seed was covered with the hoe, which was done by drawing the soil diagonally inward. This method, however, is not favorable to much exactness of depth; but we had plenty of seed, and it came up finely in about a week. We had another piece within the same enclosure, which was in as bad condition as the neighborhood, being overgrown with Canada thistles, some milk weeds, and such grasses as could

* Similar to our common orchard caterpillar, which, in its perfect state, the European lackey-moth very closely resembles, if it is not identical with it.—*Fils. N. G. Far.*

struggle for an existence among them. It was ploughed about the beginning of the sixth month; and fresh manure thrown in small heaps. Over these, the earth was drawn with the hoe two or three inches deep, and pumpkin seeds planted. Just before the vines began to run, the ground was ploughed again, turning the urrows towards them and the weeds around the hills cut up; but no harrow was introduced. The prospect of the crop is very promising. We are satisfied, however, that the vigor of the plants is chiefly to be ascribed to the fresh manure. The culture has been grossly deficient. Further reflection on the subject has convinced us, that if instead of throwing the manure into heaps, it had been laid in rows, and then intimately mixed with the soil, by the harrow, the plough, and the drag-roller frequently applied in succession, breaking and grinding the clods which now remain on it to a fine tilth,—the crop would have been much greater.

In preparing the ground for root crops, we are persuaded that such would be the proper course. In this kind of culture more especially, farmers generally err by not pulverizing the soil sufficiently. In preparing a strip for Swedish turnips this season we had it harrowed sixteen times in immediate succession; and from hard ground it was reduced to a beautiful tilth. We operated however, to a great disadvantage for want of a drag-roller which would have crushed the clods and ground them to dust.

Where clods of various size constitute three-fourths of the soil, what proportion, do you suppose, is occupied by the roots of the crops? These pass between the lumps but cannot enter effectively into such as are large and harden in the sun; and we are inclined to suspect that one-third of the same soil in depth, completely pulverized would yield more nourishment to the plants. This opinion will appear more reasonable when we consider that the absorbent power of a soil depends greatly on its *fineness*; and that the interior parts of a clod absorb but little, if any, moisture from the atmosphere, or even from a shower of rain.

In regard to the application of fresh manure, we know that in many cases the practice is very injudicious. A forkful of straw and dung, trodden firmly together like pressed hay, is often thrown down on the field; and having been tossed a rod or two during the operation of spreading, *there it lies*. The plough comes along and covers it about half up, the other part remaining like a monument above the surface of the field. The few plants that grow near it may draw some nourishment from its sides; but it is a dung-heap of itself, with the rankness and fermentation of other dung-heaps only in a less degree. Perhaps another lump may be slightly covered by the plough; and if on this thin soil, a beet or a stalk of corn is set to grow, can we expect it to flourish in dry weather?

Well-rotted manure is more easily mixed with the soil; and this we believe is its only advantage over what we obtain from the barn-yard in spring. The apothecary *rubs down* a roll of sulphur in preparing ointment; and the farmer, by means of the harrow and drag-roller may *rub down* fresh manure and soil into an amalgam. In this way we may get its whole strength without injuring any plants that such substances ever stimulate or nourish.

We do not expect however, that farmers will subject large fallows to such perfect culture; but we will mention a fact for their encouragement. One of whom we have some knowledge, and who has become independently rich by cultivating the earth,—has been known to harrow his fields four or five times when others would have been satisfied with a small part of the labor. "Why do you harrow your ground so much?" was the question of a neighbor. "It is my

fancy," was the laconic reply, but his crops might have served for an answer.

The ground where our beets grew, though not so thoroughly prepared as we would recommend, is generally in fine condition. Where the manure was well broken, its traces are most visible by the superior mellowness and moisture of the soil. †

The Rose-Flowering Locust.

The Rose-flowering Locust (*Robinia hispida*) grows well in many parts of the Genesee country; but it is equally true that in many other parts of the same district, it will not flourish. So far as our observations have reached, heavy loams are unfavorable. To obviate this difficulty, we made a new soil of sand and vegetable earth; but were not able to suit it; and the last season we devised another plan. As the common locust (*Robinia pseudoacacia*) grows freely wherever it is planted, the idea occurred that the Rose-flowering might be contented to stand on the stems of the former, and thus avoid defiling itself with our soil. Accordingly we set a number of grafts, two are growing, apparently healthy, and flowers have already been produced. On inquiry however, we learn that others have been beforehand in trying the experiment, but make very different reports; one representing that the grafts soon decline; and another speaking of them in favorable terms.

What information can our correspondents afford us, on this subject? †

Ploughing in Wheat.

We lately noticed the superior benefits of this method of putting in wheat; and would again recommend it, especially to those who have lands considerable worn. The *depth* at which the seed is buried, is more regular; and gives the young plants a strong hold on the soil. The *unevenness* of the surface is another item of great importance. Some farmers roll their wheat in the fall; and we have done so to much disadvantage,—for the blades had no protection from the sweeping winds, and they suffered greatly. Other farmers who plough in their wheat, then harrow it; but we decidedly condemn the practice. Let the ground remain as rough as the plough leaves it.

For ploughing in wheat, as the furrow should be narrow, a one-horse plough answers very well; and if two horses draw it, their speed may be brisk. By ploughing lands only eight or nine feet wide, we have many dead furrows which serve as drains for the surface water; and by crowding well together the earth from the two middle furrows of each land, it may be raised considerably above the general level. In a climate so wet as ours, every such inequality is an advantage.

In our native land, and in years that have long passed away, to plough in wheat was the general custom. Then came the method of harrowing in. It could be done more expeditiously, and many who did not take time to reflect that often haste makes waste, adopted it. It was a crab-like advancement in agriculture. But if any of our readers are unwilling to try a whole field by ploughing in, let them try a part. If one-half is too much, try a quarter. Try a few lands—try one land—but try it. And having arrived at this determination, do it—not to the halves—but thoroughly. Make the experiment fairly, and in a farmer-like manner. †

Cleaning Clover Seed.

MESSRS. EDITORS.—In your paper for this month, I read an inquiry from a Canadian correspondent, (S.) as to the method of cleaning clover seed.—Now, to pen an accurate description of a clover machine would require too much room, as well as a much abler pen than mine. Nevertheless, I will use my best efforts for the benefit of your readers, it being a request from you to your correspondents generally.

The first process is separating the heads from the straw.—This is done by thrashing it with a flail, in the usual manner of thrashing grain, which can be done with comparative little labor, in cold winter weather.

The second process is separating the seed from the hull or chaff.—The machine necessary for this purpose, is similar to a small sized thrashing machine, except that the cylinder and concave are covered with heavy sheet iron, which is punched with a round and sharp punch, so as not to cut the piece out where it goes through; but leave the edges sharp and ragged on the under side. This is nailed on to the cylinder with the rough side outwards, and the concave, similarly punched, is nailed on with the rough side inwards. These are set so close together, that a few of the longest teeth (as they are called) will touch until it has been used for a while.

The heads or chaff, as it is often called, are fed into the machine through a hopper, which extends the whole length of the cylinder, and is secured over the cylinder, so that not more than one-third of the width or diameter of the cylinder is visible through the mouth of the hopper, which is formed with the ends perpendicular, and the sides spreading not more than half as much as the hopper of a common fanning mill.

The manner of driving this machine, as well as the size of it, must depend on the power by which it is to be driven.

The third process is cleaning the seed when so separated.—Any ordinary fanning mill will answer this purpose. First, close the side doors which regulate the current of air; then take out all sieves but the coarse chaff and the wheat sieves; then put a thin board in the place of the sloping or chess sieve, so as to prevent the seed from going into the chess box, and also remember to put the wheat sieve into the lowest sliding place, so as to break the fall of the seed on the sloping board; then turn rather slowly and feed slowly.

It will be found on examination, that that part of the chaff, (that part lying next the mill,) has yet some seed in it; this must go through the machine again, and we have sometimes to put a portion through a third time.

When this is accomplished, the seed will be separated from the chaff, dirt, &c.: but in order to make it fit for sowing, or for market, it must be cleaned similar to Timothy, Turnip, or other small seeds. For this purpose it is necessary to have, instead of the wheat sieve, one finer than the sloping or chess sieve the material for which can be procured at any of the hardware stores—and the wheat sieve must be substituted for the coarse or chaffing sieve.

I have briefly stated the method used in this neighborhood; and although but imperfectly described, it can, I think, be comprehended by any man of ordinary mechanical powers. Yours, &c.

Fulton co. August, 1840.

W. N. H.

Remarks.—We thank W. N. H. for his communication, and, as the subject is very important to most of our readers, we should be glad if he, or some other competent person, would give us a little further practical information respecting growing and cleaning clover seed. As to the kind of soil; time and frequency of sowing; time of cutting; whether the first or second crop is best; usual amount of seed obtained from an acre, &c. Also, whether the thrashing cannot be done by a common thrashing machine instead of the flail; what is the cost of a clover machine with and without a horse power? Can the clover machine be easily adapted to the different kinds of horse powers, used for thrashing wheat, and what amount of power is required?—*E. S.*

The Flowers of Summer.

We are informed that the *Harrison Rose* originated in New York with a gardener of that name.

On a thiatly looking plant, five feet high, with several branching stems, small blue flowers are collected into balls, often two inches in diameter. This is the *Echinops sphærocephalus* from Austria. Its heads are neat and singular.

Phlox has been well represented in the present month. A sort which we imported from England some years ago, without a name, has been long in bloom, and is much admired for its red-purple flowers. In some respects, it resembles *P. maculata*, but in others, it is very distinct.

Phlox paniculata affords several fine varieties, all red-purple however, and not a clear red. One, remarkable for the size of its flowers, is rather pale; another, of a deeper hue, has the segments of the corol, reflected; and a third, not less intense in color, has the segments patent. "Breck's Seedling," perhaps another variety of this species, is one of the finest of the fine. It is more than four feet high, forming dense panicles; and as the corol is of a lighter color near the tube, it resembles a "multitude of eyes."

Another kind which we received under the name of *P. pyramidalis* *V. purpurea*, has made a fine display. In the mornings it is tinged with blue, but not in the latter part of the day. This circumstance is very curious; but we proved it completely by comparing it with slips from a panicle of another species, at different times; and they agreed or differed according to the hour.

P. drummondii is the only known annual species of this genus. It is a native of Texas, and considered one of the finest ornaments of the border. Almost every plant is a separate variety; and we have them from very pale to the most glowing purple. With us, it has done best where the soil is sheltered most of the day from the sun.

Hibiscus affords some fine ornaments at this time. *H. Syriacus* a Syrian shrub, well known by the name of *Althæa frutex*, has passed into several varieties, single and double. All that we have seen have purple eyes. Such as are very double, seem to be more tender; and the double white particularly so—indeed it is not adapted to this climate. We have the double purple however, which has attained the usual height of eight feet, and has withstood the winters of many years. We think the single varieties have most beauty.

Our other species of *Hibiscus* are herbaceous.—One with very large flowers of the purest white and a red eye, is a general favorite. *H. Palustris* from the marshes of the Seneca river, when transplanted into a congenial soil, has also very large flowers, but of a fine rosy hue. It grows four or five feet high. *H. moscheutos*, pale red with a deeper colored eye is very fine, and does well in a dry but sunk border. Another sort, almost white with a slight tinge of red, is like the two preceding kinds perhaps, only varieties of the same species.

Some years ago, we received seeds from a collector who had gathered them in the South, which he called a variety of *Hibiscus militaris*. It differs however, from Elliott's description of this species; and also from *H. carolinianus*, which it more nearly resembles. It is quite hardy, and grows nearly seven feet high—flowers five inches across, of a fine rose color with a deep red eye. It is a glorious plant.

Young seedlings of these species, are liable to be drawn out by the frost in winter; and older plants to lose their best buds near the base of the stem. An inverted sod placed over them at the commencement of cold weather, and left to remain till there is no longer any danger from severe frosts in the spring, would protect them effectually.

Gilia coronopifolia (formerly *Cantua*) is a biennial from Carolina, but succeeds well in a covered border. One plant has six stems more than four feet high. The flowers are tubular, beautifully speckled with red and yellow, and generally hang on one side of the stem.

The white flowered *Argemone* is a favorite annual, and much superior to *A. mexicana* with yellow blossoms. There is another species (*A. ochroleuca*) with whitish flowers but less showy. All these have become naturalized in the garden.

Nuttallia pedata is a perennial from beyond the Mississippi. Its red-purple flowers an inch in diameter, are very neat and pretty, continuing long in bloom. These are on long slender stems, destitute of leaves, except a few near the ground. There are other species of this interesting genus, such as *N. digitata*, *N. papaver* and *N. grandiflora*; but the two last are treated as Green House plants.

The *Verbena*s add greatly to the beauty of the border. *V. aubletia* from Louisiana, not able to abide our winters, takes the habit of an annual. It exhibits its rosy flowers through part of summer and all of autumn, unless the frosts are severe. Even *V. r. tcediana* from the Green House, bears light frosts without injury. This plant should be assisted in taking root from its joints; and it will grow more vigorously and bloom more profusely. Its scarlet and crimson flowers are very splendid.

The species of *Rudbeckia* are generally rough and coarse, more suitable for the shrubbery than the border; but they are very showy. *R. fulgida*, *R. moschata*, *R. hirta*, and *R. pinnata*, are among the best,—the last particularly. *R. laciniata* is a native of this district in moist woods. All of them are easily naturalized.

Silene regia has star-like flowers of the brightest scarlet. It is a native of Ohio, grows from three to five feet high, and the plant continues to increase in magnitude from year to year.

The Clary (*Salvia Horminum*) is a curiosity.—The top of each stem for an inch or two, is ornamented with purple leaves which careless observers would mistake for flowers. There is also a pale-red variety. Both are pretty.

Salpiglossis is a genus from South America, including several species which make a fine display.—When the stem has nearly done flowering, it may be made to acquire new branches by bending it down, and these will continue long in bloom.

Last spring we received seeds of *Troedtia carulea* from Union College. It is now finely in bloom, and its cerulean hue, contrasting with all our other flowers, renders it more interesting. It is a Green House perennial, but like many others, it may be treated as an annual.

Bartonia aurea (Golden Bartonin) an annual, is considered a great acquisition. Previous to its discovery in California by Douglas, two other species (*B. ornata* and *B. nuda*) had been found up the Missouri, the former biennial and the latter apparently perennial. Those plants had ten petals, but our present species has only five, so that the former generic character must be modified. It is remarkable that the species from the Missouri introduced into England as early as the year 1811, are scarcely known to florists, though according to Nuttall they are among "the most singular and splendid in North America;" and Loudon says they "open during the night and spread a most agreeable odor."

Wild Rice--Wanted.

We wish some of our readers living near Lakes or Rivers where it may be found, would procure us some seed of the Wild Rice. They shall be compensated for their trouble on sending it to the Rochester Seed Store.—Eds.

Clover Seed and Machines.

Since the remarks on another page were in type, we have received one or two more communications on the subject of cleaning clover seed. We publish such as contain information to the point.

Messrs. Editors—In reply to the inquiry of S., in your last paper, I would state that last season I sent to Seneca county and obtained a clover machine that was made at Trumansburgh, Tompkins county, by Messrs. Grant & King—price \$75.

The patentee is at Albion, Orleans county, where the machines can be had by addressing I. V. Blackwell.—The machine is worked by horse-power, the same as is used to thrash grain, or it may be attached to water-power. (I prefer the former, as it is easier to move the machine from one farm to another, than to carry the heads or chaff to the mill.) The machine is about as large as a fanning mill, with concave and cylinder similar to a common thrashing machine. The cylinder is about 30 inches long and 18 inches in diameter, and is covered with hoop iron, made rough like a rasp, and the concave is lined with the same.—Less power is required to propel it than a machine for thrashing grain. It requires two hands to attend it, one to feed the machine, and the other to drive the team. After passing through the machine, the seed is cleaned from the chaff by running it two or three times through a fanning mill.

I last year raised one hundred and forty bushels of clover seed; and although it was new business to me, I found no difficulty in the operation. I cleaned from six to twelve bushels per day—and have heard of much more being done by the same kind of machines. It is necessary that the clover be ripe when cut, and that the chaff or heads be dry for hulling.

Respectfully Yours,

E. HARMON.

Wheatland, August, 1840.

A letter from Thos. D. Burrall, whose advertisement appears on our last page, informs us that he makes clover machines of small size for horse-power and farm use—price \$65; and of large size for water or horse-power—price \$80—prices uniform.

Mr. Burrall has devoted much time and money to the construction and improvement of agricultural implements, particularly thrashing and clover machines. His machines are much in use, and we believe give general satisfaction.—Eds.

"The Last Rose of Summer."

Respectfully inscribed to Miss M. H. who, in a manner well calculated to flatter the vanity of a man of 50, if he had any, and at the same time excite in his mind melancholy feelings, presented the author with the last lovely Rose which bloomed in her garden in the summer of 1840.

"Tis the last Rose of Summer" that gleams on its spray,
Thy beauties, thou, frail one, must now pass away;
Like all thy companions, thou soon must be gone,
And I sigh as I say it, my Rose is alone.

Long flourished my rose, on the tree where it grew,
And often its petals were bathed in fresh dew;
Full oft in its freshness it drank the first ray
That lit up the morning and glow'd at noon-day.

It was fann'd by soft zephyrs which floated along;
The wild bee's sweet murmur was thy evening song;
A Philomel, nightly did thee serenade;
And the black-bird and thrush sang by day in the shade.

Now the chill wind of autumn thy requiem must be,
And I sigh as I say it, my last Rose of thee,
The bee, whose soft murmur oft soothed thee is gone,
And she who sung nightly, full far off has flown.
The black-bird and robin, far—far have they fled
And I sigh as I say it, my Rose, thou art dead.

Nay, I'll smile now to say it, thou art not alone,
Thou hast joined thy companions who before thee have gone
From the spray which long bore thee, another shall spring,
To it, as to thee, shall sweet Philomel sing;
The black-bird and robin shall pour forth their notes,
While the thrush and the wren shall tune their sweet throats;
In short it shall live, as thou did'st in thy day,
Then submit to stern fate and pass silent away.

I will not complain but submit to my lot,
Since like thee, my Rose, I must soon be forgot.

Lockport, N. Y.

SUB ROSA.

Inquiries about Orchard Grass, &c.

Messrs. Editors—Can you give me any information about orchard grass (*Dactylis glomerata*;) the soil best adapted to its growth, the time and manner of sowing, quantity of seed per acre, its value for hay or pasture for cows compared with Timothy or other grasses, the number of croppings it will bear in a season, and the time of its duration? This grass is not cultivated in this section of country, and information concerning it is earnestly solicited through the *New Genesee Farmer*.

I was much pleased with the essay on grasses by Professor Dewey, in former numbers of your paper, and regret that he so soon laid down his able pen. May we not hope that he will again appear in your columns, and give us further information about the grasses, and also descriptions of the noxious weeds which are becoming so serious an evil in some parts of the country? And, if you will allow me to make a suggestion, I think it would increase the value of your already invaluable paper if you would give cuts with descriptions of the most injurious weeds. In this section of the country we are wholly unacquainted with the Canada Thistle, Stein Craut and Charlock, or at least they are not known by these names; and if they have yet been introduced here, we may be better able to guard against them if we are sufficiently acquainted with their looks to detect them on their first appearance. I think we ought to become acquainted with our enemies as well as our friends.

Respectfully your Friend,

SERENUS.

Lewisburg, Pa., August, 1840.

Remarks.—Orchard grass is not much cultivated in Western New York.—We wish some one of our readers who has experience on the subject, would furnish an answer to the above.—In respect to Professor Dewey, we regret to state that severe illness has for some time past deprived this community of his very useful labors. We are happy to say however, his health is now nearly restored, and we trust he will soon resume his responsible duties in the Institution over which he presides.—*Eds.*

For the New Genesee Farmer.

Farming; Its Advantages.

Messrs. Editors—Farming is exempt from those great and almost overpowering evils, to which nearly every other branch of industry has had to succumb of late; I mean the evils of the credit system. The production of the farmer is always a cash article. The Banks will loan money to purchase the staples of the country in time of great money pressure, as the banks place them in funds in New York. This is a great boon to the farmer; it is one great cause of his success; it is alone sufficient to make his condition enviable.

Look at the City trader or the jobber, and the country merchant—what is their condition and daily task, sales all on credit, profits on paper, failures in collections, losses, goading apprehensions, failing credit and consequent inability to buy well, small profits with increased expenses, skinning usury, bankruptcy and disgrace; then comes the final struggle between pride and poverty, diminished self-respect, old age, sickness and the grave.

The extensive mechanic is but little better off. As times are constituted, he too must give credit and a long one too, on both his stock and his labor. If he makes his employers rich, he of course gets his pay; but if his employers fail, Shylock grasps the assets, and the mechanic may whistle.

Not so with the farmer; even bankrupt millers, and gambling speculators, can find cash to pay him for the fruits of his industry. If he sells on a credit, it is because he gets more than the market price, and more

than the purchaser ought to pay. It is often said that no miller but a lame duck, will buy wheat on a credit—if a farmer sells to one of these he ought to lose.

But in the midst of every blessing, farmers do complain of low prices and hard times. How do the facts stand? are prices lower or is money scarcer than it was 10 years ago? Certainly not; but the artificial wants, the style of living of the farmer, have fearfully increased—and he seeks for a panacea, not in the sober lessons of early experience, but in the illusory, soul-sickening promises of future inflations.

It is true that farmers and their families exhibit outwardly a much higher state of civilization, than they did 10 years ago, but what progress have they made since that time in intellectual cultivation? Have they learned to prize and enjoy the simple pleasures of rural life, and to understand their endless variety? Does the farmer's green fields, ploughed fallows, his trees, his rocks, and his bubbling brooks, now teach him lessons which ten years ago he could not understand? If they do, then is he on the road to that intellectual improvement which will moderate his self-love, teach him to be satisfied with the day of small things, and to despise those temptations which lead to expensive show, effeminacy and ruin. SENECA.

Improved Breeds of Swine.

Much has been said of late in agricultural papers respecting new and improved kinds of hogs, and we have sometimes been asked why it was that our columns contained so little on the subject. Our answer has been, we did not possess sufficient personal knowledge on the subject to enable us to form an intelligent opinion respecting it, and much that we read about it savored too strongly of "speculation" to suit our taste. We are fully convinced, however, that very great improvements have been made in the breeds of swine. Some good specimens of Berkshire, China, Leicestershire, and various crosses may now be found in this vicinity; but the finest and most *gentle* lot of hogs—(we beg their pardon, we meant to say *swine*;) that we have ever seen is the stock of A. B. ALLEN, Esq. of Buffalo, whom we had the pleasure of visiting a few days since. Mr. Allen has imported several fine animals, and has purchased largely from other breeders and importers in order to supply the great demand for pigs, for the west and south. He has sold a large number during the summer and is constantly receiving orders for more. The following account of a purchase of his we copy from the *Cultivator*. We intend hereafter to give descriptions of some of the most improved breeds of swine. There is much room for improvement in this department among farmers, and we hope our readers will not be slow to perceive it.

Large Sale of Berkshires.

It will be seen by the communication below, that the Shakers at Watervliet, near this city, have sold out their entire breeding stock of Berkshire hogs, to A. B. ALLEN, Esq. of Buffalo, and that they retire from the business of breeding them for sale. On the day previous to the shipment of the stock to the west, we had the pleasure of riding out to the neat village of these people, and looking over their superior animals; and, however familiar we may have been with Berkshires, we must confess that the splendid array of these noble quadrupeds excited our astonishment and admiration. While we regret that Albany county should lose this choice stock, we are glad to find that it has fallen into the hands of so spirited and judicious a breeder as Mr. ALLEN; and perhaps it is upon the whole for the best, as at Buffalo it is several hundred miles nearer to the Great Western Market, and we are not without hopes that this greater proximity to purchasers, will extend the diffusion of the breed, for we are satisfied that the pork growers cannot possibly make a more profitable investment than in the improved *machines*, (if we may be allowed the expression) for the manufacture of this great staple article. No farmer would want but one sight of the beautiful store barrows that we saw in the piggery, to convince him

of this. Their large fine, and delicate forms, could not fail to excite his admiration.

Mr. ALLEN has also purchased a few other very large choice animals, of established reputation as breeders, belonging, we believe, to Messrs. MUNDRETTON and MERG of this city. All these animals have been stunted to Mr. LOSSING's late imported boars, and cannot fail this fall to produce a very choice offspring. We doubt whether, with this addition to Mr. ALLEN's stock, his herd can be beat, or rarely hardly equalled, by any herd in England, at least if we may judge from the finished engravings which occasionally appear in the *British Farmer's Magazine*. In the March No. of the present year, we find the portrait of a boar bred by the Hon. J. Shaw Lefevre, a wealthy landed proprietor, and Speaker of the British House of Commons, and by the exhibition of which, at the Oxford meeting of the English Agricultural Society, he won the highest prize of ten guineas (\$50.) Forward, this might be called a good animal, but otherwise he has narrow hams, and a high steep rump, and has nothing of the finished air and fashionable range of the Shaker stock. Mr. A. informs us that he intends still to enlarge his stock, and that he has made arrangements to receive in September next some of the best that the piggeries of England can afford, without regard to price, and unconnected with former importations, for a fresh cross. With these additions to the previous high bred stock of Mr. A., the person who cannot be satisfied from its produce must be hard to please. We wish him every success in his laudable enterprise in the improvement of the stock of the great and fertile west.

Watervliet, July, 1840.

EDITORS CULTIVATOR—Being situated so far from navigation, and it being so troublesome for us to ship our stock, we have concluded to retire from the business of breeding Berkshire pigs, and have accordingly sold out all our *prime* stock to A. B. Allen, of Buffalo, reserving only a few sows of medium size for the production of our own pork. This is a very superior stock, and such as has universally taken precedence even among Berkshires, wherever sent. Most of these animals are about as large of their age, as the superb sow Maxima, purchased of us at one hundred and fifty dollars, by John Lossing, of Albany, and faithfully figured and described in the May number of the current volume of the *Cultivator*, and one of them we think, when fully grown, will even be superior; and we earnestly recommend this stock to the public, and have no hesitation in saying, that it will not be likely to deteriorate in the hands of A. B. Allen, and those who have heretofore addressed their orders to us we respectfully refer hereafter to him.

STEPHEN WELLS,

JUSTICE HARWOOD,

Trustees of U. Friends, commonly called Shakers.

Disease in Poultry—Inquiry.

Messrs. THOMAS & BATHAM.—My hens and chickens are affected with a kind of distemper of which some have died. The disease causes a swelling of the neck, and an appearance of water in the lower part of the neck. If you, or any of your correspondents, can inform us how to cure or check this evil, you will perhaps oblige more than one subscriber.

Respectfully Yours,

M. II.

Black Rock, August, 1840.

Remarks.—We have no personal knowledge of the above disease, and cannot look up an answer in time for this number. Some information concerning it will doubtless be given in our next.—*Eds.*

Ring Bone on Horses—Inquiry.

Messrs. Editors.—I have a valuable young horse affected with what is called a Ring Bone, on his hind foot; and if you, or any of your readers, can inform me how to stop or cure it, I should esteem it a very great favor.

Yours, &c.,

JOEL P. BENNETT.

Wellington, N. Y.

Remarks.—We are proud to say that our editorial aids and valuable correspondents possess a very respectable amount of useful knowledge, and show great willingness to communicate it to others; but we are sorry to inform Mr. Bennett that we do not expect to be able to furnish a cure for Ring Bone. Some of our friends may be able to tell how to afford some relief; but a cure we apprehend is impossible.—*Eds.*

Agriculture of Upper Canada.

(BY THE HON. ADAM FERGUSON.)

(Continued from page 117)

Observations on the Making, Curing, and Casking of Butter.

1. The milk house or dairy, should have no internal communication with any other building. It must be kept free from smoke, be well ventilated, and clean, and no potatoes, fish, or such articles, kept in it. The dairy utensils must be its only furniture, and these must be kept *scrupulously* sweet and clean.

2. The milk when brought in, is to be strained through a fine hair sieve or strainer; then put into the dishes or pans. A tin skimmer, with holes, is best for taking off the cream, *which should always be churned while the cream is fresh.*

3. The churns, whether plunge or barrel, should be made of the best well-seasoned white oak, and the *utmost* attention paid to scouring, drying, and airing the churns immediately after use. If this is not done, a sour and unwholesome flavor will be communicated to the butter next made.

4. *Immediately*, when taken from the churn, the butter is to be steeped, *for one hour*, in cold spring water, to grow firm, and after being three or four times washed, some fine salt is to be thrown into the water, which will improve the color, and purge out all the remaining portion of milk. This is an important point.

5. When thus prepared, the butter is to be immediately salted; the allowance of salt to be one and a half ounces of common salt to each pound of butter.—If intended for immediate use, less salt will suffice. In Ireland, a small portion of saltpetre is added.

6. It is a bad practice to keep on the product of one churning, *uncured*, to be mixed up with the next.—The flavor of the whole is invariably injured, and where a sufficient quantity is not procured in one day to fill a cask or keg, a partial salting, with a linen rag steeped in brine, may be applied.

7. The butter is to be packed firm into the firkin, with a round tramp stick of sufficient thickness and weight. When filled, a little of the purest salt is to be strewed over the surface, and the head fitted on, accurately close.

8. Liverpool stoved salt, or that called *Bay*, from Portugal, are most effective. Salt must be kept dry, and a little unslacked lime below the cask will be found useful.

9. Mixing the salt with the butter should be done in wooden dishes, after the water and milk are completely got out, and then immediately packed firm into the firkin, which will keep it smooth and firm.

10. The milk of *new* calved cows must be rejected for four days after calving. A very small quantity of such would spoil a whole firkin. Scalding cream in cold weather is a bad practice.

11. Casks must be steeped in pure or running water and very carefully dried. They are to be made of the best oak or ash, and ought not to contain more than 2 lbs., at least that size is best liked in the London Market.

N. B.—The calculations and quantities here stated, relate to the Aberdeen pound of 28 ounces, avoirdupois, and the salt is reckoned at 16 ounces to the pound, avoirdupois.

Management of Cattle.

The general management of our cattle, with a few suggestions upon winter feeding, will now demand our attention.

It is impossible to visit any settled parts of Canada, especially at those seasons where care is particularly required, without having to lament the neglected condition of the cows and other stock. No doubt our extensive forests afford food and shelter to a considera-

ble extent; but yet it is too visible in the stunted growth of the young, and in the sunken eye and attenuated carcass of the older cattle, that a reasonable provision is denied them, while too often, *water*, that prime necessary of existence, is wanting, or scarce.

Hollow horn, with a host of other evils, naturally follow this starvation and undue exposure to extremes of heat and cold. Where common pasturage prevails, animals must be abandoned to their own resources; but where a farmer can command enclosed pastures, something may be effected.

Pastures should always be provided with shades and shelters, and where Nature does not afford them, a substitute must be found in a commodious shed. One erected in the form of a capital X will be found to answer well; and, with the addition of a rack, may frequently serve in open winter as a stable for the store stock. As there is hardly any thing of greater consequence for cattle than abundance of water, the prudent farmer will make every effort to secure a supply. Where running water is wanting, tanks or ponds may be formed, or a well with a pump and troughs, judiciously placed, may be made to serve several fields, at one central point.

Whatever trouble or expense may be required, no humane or sensible man, will permit his stock to be in want of this necessary; and he may rest assured they will repay him a hundred fold. Dr. Coventry, the able Professor of Agriculture in the University of Edinburgh, was wont, when treating this subject, to recount the small mortality, and superior condition of a farmer's stock, where an abundant supply of water was furnished, compared with the loss and deterioration of his adjoining neighbor, where that article was scanty, in a season of fearful scarcity of fodder, and where the two stocks, in regard to quality and quantity of food, were altogether on a par.

In pasturing stock, it is of much importance to associate different kinds of animals, as the horse will eat what the cow will reject, and sheep will nibble at something perhaps passed over by both.

The Canadian farmer, when grain fetches a fair value, will find one of his greatest difficulties to consist in substituting something as winter food, to produce *prime* fat.—That admirable root, the *turnip*, the key stone of stock farming in Britain, is of more doubtful attainment here. Not that very weighty crops of turnips are unknown in Canada, nor that they may not be rendered available, by care, through our winters; but it would still seem extremely dubious whether we can venture to assign them a steady and permanent place, upon any large scale, in Canadian husbandry. The minute degree of manual labor indispensable for the successful culture of turnips, and still more perhaps, the necessity of applying that labor, *by large bands* of laborers, at certain critical stages of their growth, seems, in our present sparse population, nearly to preclude a reliance upon turnips to any useful extent. It may further be doubted whether the scorching sun of Canada, at the tender point, when the plants are not yet in the rough leaf, or somewhat later, when the bulbs begin to form, with the ravages of insects, which that heat so powerfully fosters, may not, all together, combine to throw insuperable obstacles in the farmer's path. The same remarks too, will apply to mangel wurtzel, carrot, &c. Happily however, we are not left altogether without resource. A great deal may be done with the potatoe, which yields abundantly, and rarely fails. In its culture, we escape from much of the hand culture, and altogether from the delicate constitution of the turnip in its early growth. Careful, well-timed horse-hoeing, will go a great way with potatoe in rows, and even where they are cultivated in hills, considerably less hand labor will suffice, than turnips in rows will require, while a broad-cast

crop is generally defective and slovenly. We must also remember that if a sufficiency of manure is supplied, and a pretty early variety is selected for seed, the farmer will find his land in excellent trim for a crop of wheat.

Another useful article of farm produce, and well calculated to unite with steamed potatoes in feeding stock, is the seed of Flax, either entire, or after yielding a portion of its oil at the mill. It is also a most economical and nutritive substitute for a portion of the milk required in rearing calves.

In regard to our horses, the breed in Upper Canada seems sufficiently well adapted for ordinary purposes, while in the Lower Province, the hardy and active little Norman has been long and justly in favor. Our heaviest work is so generally performed by oxen, that farmers have perhaps coveted smartness and speed more than is wise. A little attention however, would soon introduce more substance and bone. Good premiums will soon bring forward powerful stallions from the States, and should any one contemplate their introduction from Britain, we would commend the Suffolk Punch, the Cleveland Bay, and the Clydersdale breeds to their attention.

Sheep.

Sheep husbandry forms an important branch of rural economy. In Canada we are yet but partially prepared for its introduction; but as our clearances extend, and facilities for the sale or manufacture of wool, shall increase, sheep will become valued, as they deserve.

In selecting a breed, we must give due attention to the object in view. With some farmers the carcass, and with others the wool, will be mainly regarded.—Besides wool and carcass, we have another distinction to attend to, in the *long* woolled and *short* woolled breeds. Of the latter, the Saxon and Merino bear the finest quality and fetch the highest price per pound; Yet it is quite possible, taking all things into consideration, that more homely varieties will pay the farmer best. The *Cheviot* is a hardy short woolled breed, and has received much attention from the Culleys and other distinguished breeders in the North of England. The mutton is of excellent quality and grain.—The *South Down* is a sheep with valuable short wool, and good carcass, and would seem to be a sheep well suited for Canada, in many respects. The largest portion of the 700,000 sheep, annually consumed in London, consists of South Downs.

Of the *long woolled* breeds, none can stand a comparison with *Improved Leicesters*, for yielding a quick return in mutton, with a valuable fleece of good combing wool. This variety will ever be associated with the name of Bakewell, to whose discernment and perseverance they owe their rise. Mr. Bakewell, as is well known, was the first man in England, or in the world, who, upon scientific and fixed principles, directed his attention to the improvement of live stock. In horses and cattle, whom both of which he bestowed infinite labor and much expense, his success has not been so brilliant, because he was unfortunate in his selection of the breeds which he proposed to improve. The huge black Leicestershire cart horse is now rarely to be met with out of his native bounds, or in the ponderous drays of London.

The Lancashire long horns, notwithstanding many desirable qualities, has been fairly beat out of the field by improved short horns.

The *Improved Leicester*, named also the *Dishley*, after Mr. Bakewell's farm, is a sheep of the highest value, where a market is found for fat mutton, and where a fleece of the finest carding quality is not required. Shearing widders of this breed, will average from 18 to 20 pounds per quarter. Taking wool and carcass together, no variety will probably make the

same return, acre for acre, in ordinary enclosed pastures. The greatest objection to them in Canada, arises from the wool not suiting the machinery in common use; but as that may soon be obviated, and they are so valuable in all other respects, they call for special attention from our farmers. It is worthy of remark, that Leicester mutton, although quite as early and fat, is infinitely superior in grain and flavor to the same sheep grown in England.

One other description of stock remains to be noticed, and though last, not least important to Canadian farmers. The *Hog* may be well denominated the *Friend* of Canada, without whose aid our forests could hardly be subdued. There is probably no domestic animal whose improvement has been more neglected, or abandoned to chance, nor is there one which can make a better return for care and attention. We have only to look at the ganut, flat-sided brute, with a head, forming, (as Paddy might say,) one-third of his carcase, and then cast our eye upon the short-legged, round-bodied, comfortable looking pig, living most probably upon the next adjoining farm, to be fully satisfied of the culpable negligence displayed in this department. The swine of Canada must not be condemned in too general terms, as the best and worst varieties meet our observation in every neighborhood.

In raising hogs, two objects present themselves, and will regulate the prudent husbandman in the selection of a breed. He may require pork merely as an article for family consumption, or he may incline to grow it as an object of merchandize. For the first of these purposes, the small breed of China make an excellent foundation, from the tendency to be always ready for the knife, and susceptible of any modification, by crossing, which may be desired.

Of the larger breeds, for bacon or salted pork, the *Hampshire* and *Sussex*, white breeds, and the *Berkshire*, piebald, black, or tawny, will be found to suit the farmer best.

With the *Hog*, as with all other live stock, one *invariable* rule should be rigidly adhered to, and which is the only security against disappointment and loss: *Never keep more mouths than you are perfectly able to satisfy.* It is painful and disgraceful to contemplate the herds of wretched swine, starving along our highways, worried and mangled by dogs, and breaking the bonds of good neighborhoods by provoking inroads upon crops.

Little or no attention has yet been paid to the great advantages of a change of seed, whether of grain, pulse, or roots. It is a well established fact in vegetation, that the quality and product are greatly improved by a change of seed, from heavy land to light soil, and vice versa.

It is more than time however, to close these cursory remarks, and I shall only add, that if you consider them worthy of a place in your journal, I trust they will be perused in the spirit in which they have been penned, viz: a candid and anxious desire to advance the great cause which you seek to forward, and tend to strengthen *Agriculture*, the impregnable bulwark for the security and happiness of nations.

Yours, &c.,

Woodhill, U. C. ADAM FERGUSSON.

Rainy Days.

MESSRS. EDITORS—How much time is thrown away by some farmers in our country, when the weather will not permit them to work out of doors. This time might be well improved by every farmer. In the course of a season there are many days of wet weather, in which it is impossible to do work on a farm; therefore when these are lost, (as they are to many farmers of my acquaintance in this vicinity,) they amount to a considerable sum. "Time is money," as the

saying is; therefore how important it is for we farmers, at this day of the world, to take care of the pence, and the pounds will take care of themselves. Now if this is good advice in money matters, it will surely apply to our domestic affairs—to those hours and half-days when the rain drives us under shelter.—Well, some will ask how these hours and half-days can best be employed? I will tell you, my brother farmers. Get yourselves a set of carpenter's tools, and make a work bench, and if you can plane a board and drive a nail, you will find enough to occupy all the spare hours and days you will have in a year. The tools will cost but five or six dollars, such as are most necessary for a farmer's use, and then you will be able to keep your out buildings, and stable doors, &c., in good repair, without paying out the money. If your barn doors get out of order, the first rainy day you can repair them. If a board on your fence gets loose, put a nail in it or replace it. In this way you can improve every rainy day, and thereby keep your buildings and fences in good condition.

Many farmers in our country think if any small job of work is necessary to be done on their premises, they must go and employ a mechanic to do it, when they could very probably do it just as well themselves, and consequently save expense. If a farmer wants any plain and useful furniture for his kitchen, such, for instance, as a pine table, benches, &c., take a rainy day to do it. But it is unnecessary to multiply the many things that might be done or prepared in such times. Every farmer that looks around his premises, (if he is not in the habit of so doing,) will generally find his out-buildings and fences are decaying, and out of repair. Every farmer should accustom himself to the use of tools, and whenever he wants a small job of work done, he can do it himself, without going four or five miles after a carpenter. I know a good many farmers in this vicinity, that have not a hatchet, drawing knife, auger, plane, or work bench, about their premises. The consequence is, their jobs go undone, and they have naught to do on rainy days. Is this economy? I can safely answer no. Yet such men will carry their grain five miles further to a market where they can get two cents more on a bushel. Enough has been said to convince those who do not improve rainy days, that they must inevitably be running down hill, and soon their out-buildings, fences, &c., will all be gone. Therefore I close my remarks upon this subject, and wait with anxious solicitation to hear it more fully dealt with.

W. S. T.

Shade Trees in Pastures.

MESSRS. EDITORS—I believe it is a prevailing opinion among farmers, that shade trees are beneficial to cattle in hot weather; but from my own observation, I am inclined to think quite differently.

I have been engaged in the dairy business several years, and have noticed that cows often decline in their milk in very hot weather, notwithstanding they had good pasture and plenty of water. This led me to take some pains to ascertain the cause of this declension. I am this season milking fifty-five cows; I have two pastures, of about seventy-five acres each, both seeded with the same kind of grass, the feed equally good, and both well watered. One of them has no shade in it, but the other has a piece of woodland enclosed with it, and some scattering trees which afford shade. Until recently I have made a practice of turning my cows into one pasture one week, and into the other the next. Since our intense hot weather came on, I noticed that during the week when the cows were in the shady pasture, the weight of our cheese was from 15 to 20 lbs. per day less, than during the week when they were in the pasture without shade.

This led me to examine the cause, and I noticed that in very hot weather cows will not feed half as many hours when they can find shade, as they will when deprived of it. Of late I have practised turning my cows into the shady pasture during nights and cloudy weather, and into the other pasture during sunny weather; since which my cheese has been of uniform and full weight. Hence I am led to believe that pastures for cows are better without them with shade. Such is their dread of the scorching rays of the sun that cattle will stand in the shade and fight flies until hunger forces them from their retreat.

Yours respectfully,

ARTHUR F. BILL.

Hardingsburg, Ia.

Remarks.—Our correspondent seems to be fully convinced that shade trees are injurious to cow-pastures; still we feel inclined to doubt whether the evil effect is generally as great as appeared to him. At all events we shall cry "*Woodman spare that tree!*" and we hope our readers will "*Touch not a single bough!*" of the beautiful oaks, elms, maples, &c. which perchance may now ornament the boundaries of their pastures, until more evidence is adduced against them, and some admirer of Nature's beauties has been allowed to speak in their behalf.—*Eds.*

For the New Genesee Farmer.

Prospects of the Wheat Market.

MESSRS. EDITORS—The question is in the mouth of every farmer you meet—What price shall we be able to get for our wheat?—And no wonder it is often asked; for on its answer depends in a great degree the footing of our profit-and-loss account for the year.

Interesting as the question is however, it unfortunately belongs to that class which is easier asked than answered. To undertake to predict the realization of any specific price might seem presumptuous; yet I will venture to say that much, very much, depends upon our *wisdom and sagacity in marketing the article.* It is a mortifying fact that our farmers, as a class, are extremely unwise in this branch of our business. When prices are high, we hold on for higher; and when low, we seem to think there is no time to be lost in securing what little we can get. In the fever of excitement we simultaneously rush upon the market, and after glutting and depressing it to its lowest ebb, sell our hard earnings for a mere "*mess of pottage.*" We pay little or no regard to the prospect of demand and supply,—considerations upon which all commercial transactions should be based;—but (particularly when prices are extreme either way) allow ourselves to be governed quite too much by the impulse of temporary excitement.

Let us now look at the prospect before us, with reference to the considerations of demand and supply.

And, first of supply, or quantity on hand. We have undoubtedly, (notwithstanding local failures here and there, from different causes,) at least as large a quantity of bread stuffs on hand, and probably as great a surplus, after supplying our own people, as we ever had. Of course this surplus will of itself involve us in ruinous prices, unless it shall be absorbed by foreign demand. Hence it becomes us to ascertain whether such a demand may be prudently calculated upon; and if so, to what extent.

By a careful examination of extracts from late English papers, we shall find,

1st. That the weather is so ominous as to produce serious apprehensions of a bad harvest. These fears however, may, and quite probably will, be dissipated by a favorable change of weather.

2d. That the prospect is that the crop throughout Great Britain "will prove much, very much, below an average." That in Ireland "the peasantry are

already compelled by hunger to plunder ware-houses, and corn-laden vessels;" and "exceedingly severe sufferings are apprehended on the part of the working population in England and Scotland."

3d. That "although money in England is excessively plenty, and interest on short time very low, yet stocks are depressed; capitalists declining investments on long time, in anticipation that the drain will be so heavy for the purchase of bread stuffs, as to produce, within a few months, a great scarcity of money, and corresponding high rates of interest." And some are even predicting that "the bank of England, (whose vaults were never better filled,) will be compelled, before another harvest, to suspend specie payment, in consequence of the very heavy call for money to send abroad for grain!"

4th. That "the crop on the Continent of Europe generally is so much below an average, that, at the best, they will have nothing to spare." And

5th. That "Russia and her dependencies are suffering from famine to that degree that the Emperor has opened his ports to bread stuffs, *duty free*, from all parts of the world!" That Odessa, and the regions bordering upon the Black Sea, (the very country from which we have for many years in succession received such large quantities of wheat,) are now

shipping rye from New York to save their people from starvation!

My object, Messrs. Editors, in troubling you with my cogitations upon this subject, is to endeavor to convince our farmers that all our surplus will be needed in Europe, and of course will be exported; and that the price which we shall obtain, will very much depend upon the degree of our confidence in the winter and spring markets.

From the best information I can obtain, I am of the opinion that more than three-fourths of our farmers intend to thrash and sell their wheat as soon as possible;—all acting upon the now popular opinion, that the fall market and the first price are the best. Now, would not this be extremely unwise?

Thrashing machines have vastly increased in numbers and facility since last fall. Put these all in operation as soon as practicable, and our mills would soon be glutted. These would, before the first of October, pour such quantities of flour into New York, as to not only ruinously overstock the market, but create a false and mischievous impression in market as to the actual amount of our crop. In this state of business, of course prices would give way, and as these should decline, in the same ratio should we increase our dil-

gence till we should divest ourselves of an article, growing every day worse and worse: not considering that by our own folly and lack of reasonable confidence, we had made our own markets and reaped their ruinous fruits.

To conclude, Messrs. Editors, I will hazard an opinion, which I confess is worth but little at the most, and by which I would be sorry to mislead any one,—that every farmer in "the Genesee Country" who will manfully resolve to hold on to his wheat for a dollar a bushel till the first of July next, and will also take good heed to avail himself of the dollar the first time it is offered, will find his granary empty on or before, (and probably long before,) the day specified.

If we would manage as well in selling as our customers will in buying; or as the English did last year, in draining from us so many hundred thousand bushels of wheat, in so artful a manner that we scarcely knew they were getting or even wanting any at all, it would be a saving to us of twenty-five cents per bushel on our whole crop; but "a word to the wise is sufficient;"—and "though thou shouldst bray a fool in a mortar among wheat with a pestle, yet will not his foolishness depart from him."

C***.

Centerfield, Ont. co., August 20, 1840.

Plate I.—Fig. 1.

IMPROVED BEE HOUSES AND BEE HIVES.

A constant supply of good honey, is, with most families, a source of much gratification, and its production for the market can be made a source of much profit. The keeping of bees has of late been very much neglected by farmers generally, owing to the difficulty of protecting them from the bee-moth or worm. Much ingenuity has been displayed in constructing hives in such a manner as to be proof against the moth, and at the same time admit of the honey being obtained when desired without destroying the bees. Several kinds of hives are now in use in different parts of the country, which answer these purposes more or less perfectly. We have never seen, however, any kind of bee house or hive which appeared to possess so many advantages as the one we are about to describe, invented and patented by JOHN SEARLE, Esq. of Franklin, N. H., and which we believe is considerably used in some of the Eastern States. Mr. S. has exhibited in this city, models of his house and hives, and several gentlemen contemplate erecting them.

The above cut (plate 1,) represents the bee house, or apiary, a building 10 feet by 20, and about 8 feet high. This size is calculated to hold 36 hives; but of course the size of the house can be varied as desired. The hives are placed in two tiers along both sides, and across one end of the house. The following speci-

fications, with the plates, will afford a tolerably correct idea of the construction of the bee house and hives and the management of the bees.

Specification.—I construct a building as follows, to wit: 10 feet by 20, or of any required dimensions, to stand two feet above the ground, on posts; to be two stories high, 4 feet each, with a tight roof; frame without studs or braces; boarded perpendicularly and plastered outside and in, to exclude insects and regulate the temperature. Another covering of wood may be added. The floor to be double, with a coat of lime mortar between. A floor of cement, tin, or other smooth metal, to be laid adjoining the walls, (except at one end, where is to be a door, for the convenience of the proprietor,) for the hive to set on, $2\frac{1}{2}$ feet wide for single ones, and $3\frac{1}{2}$ feet for double ones; or it may be of wood, covered with a white-wash of salt, quick lime and sand. Over this, at the height of four feet, is to be a scaffold of similar width, and materials for another tier of hives. The bees are to pass to and from the hive, through a spout, about ten inches long, of $1\frac{1}{2}$ inch stuff, six inches wide; grooved out two inches wide and $\frac{3}{8}$ deep in two places, leaving a margin $\frac{1}{2}$ inch wide in the centre to support the cover, which is to be made of the same breadth. This spout is to pass from the hive through the walls of the building, sloping at an angle of twenty-two degrees until it projects one inch, *a*, plate 1, fig. 1, and rests on the lighting-stool, *b*, which must be equally sloping, and into which the lower end of the spout must be sunk to the top of its floor, the upper end fitted to the lower surface of the cement, or metallic floor, three inches from the inside of the walls; at which place a perpendicular mortise must be made, through the cement floor, $4\frac{1}{2}$ inches long crosswise of the spout, and one inch wide. The angle or space remaining in the grooves of the spout be-

ad or above the mortise, should be filled. Every part of the spout, before it is put together, is to be washed with the above mentioned white-wash. It must be well fitted into the walls and set in mortar.

One foot above the lighting-stool is to be a board, *c, c*, one foot wide, sloping forty-two degrees, intended to shelter the bees. Once in ten feet, along the vertical story, is to be a ventilator, *d*; secured on the outside by a shutter, and on the inside by a screen of wire or thin perforated metal, fine enough to exclude the bee-moth. When it is intended to multiply artificial swarms, a kind of balcony, frame, *e*, one foot square, should be attached at the lower extremity of the spout projecting four inches, secured on the outside by two shutters, *f, f*, the upper one to be hung at the bottom with hinges, so as to serve when open for a lighting-stool; the upper one to be hung at the top on pivots,—the upper edge being rounded and fitted to roll in a half circle, made in the frame. In the centre of the upper shutter is to be a screen, *f*, inserted of half its size, to serve as a ventilator; the upper shutter to close upon the lower one by a rabbet. In case the wall should be brick, or sufficiently thick, the frame should be sunk rather than projected; and in either case the spout should extend no further than the inside of the frame. These shutters are useful for the greater security of the bees when they are not sufficiently numerous to keep guard at the end of the spout,—consequently they should be kept closed at night during the season of the moth's depredation. In case of multiplying, the bees should pass and re-pass through the same outlet; which should, consequently, be proportionably larger.

The hives should be about sixteen inches square, and of any required height; without doors, or mouths, because they set on the board, plate 2, fig. 14, which is to be made precisely the same as the cover to the top of the hive, (and should be washed with the above named white-wash,) with the addition of a mortise corresponding with the mortise in the cement floor, two inches from the wall, for the convenience of securing them at the bottom with plaster lime. The top of the hive should be provided with two parallel bars, *g, g*, plate II, fig. 3, one inch square, spaced 1½ inches from the centre, for the purpose of supporting the cover, fig. 1. This is to be made of a board ¼ of an inch in thickness,—thirteen inches of the length is to be divided into nine equal squares, with a mortise in the centre of each, three inches long, and ¾ wide. Opposite the centre of each mortise, at the distance one fourth of an inch from each side, is to be a hole three fourths of an inch in diameter. Over this is to be placed an adapter, fig. 2, three fourths of an inch thick, with holes 2½ inches in diameter, corresponding with the holes in the cover. The holes of the adapter are to be inserted the mouths of glass quart specifiers, to be covered with a suitable box, or cover, to exclude the light while the bees are at work in them. At the approach of cold weather the bottles should be moved, to prevent the rarified air from condensing and destroying the bees, and the hives should be again covered with the same box.

The proprietor, in order to avail himself of a portion of the honey without destroying the bees,—which is in no case necessary,—and also for the purpose of changing the comb, must use double covers, between which he may introduce specifiers, for the purpose of separating the tiers. In all cases of taking honey, the upper tier must be removed and empty ones inserted at the bottom. To multiply artificial swarms, without the trouble of swarming and living, place two empty hives, plate 2, fig. 4, (connected with the spout) as usual near the wall, with a full one, *j*, behind them, (or a full hive, fig. 5, may be placed on the top of two or three) with a suitable communication for the bees to pass through the empty hives to the spout. When the new hives become filled with comb and young brood, they must be separated, and will become independent colonies. All the hives must be of equal dimensions as to length and breadth, with tops like other hives, but they may at any time be used as tier hives.

In order to employ bees profitably when they cannot collect honey from abroad, a feeding machine, plate 2, fig. 6, must be used; to construct which prepare a board of the size of the bottom of the hive, fig. 7; then make a frame of four sides, equal in size to the board, fig. 8, three inches deep, the front side of plank, with a hole through it to correspond with the mortise in the cement floor, with a groove in

the upper edge extending from one end so far that a slide, fig. 9, may be introduced, to cut off the communication with the spout, in order to prevent robberies, &c. On the upper edge of this frame is to be fastened tin, or other smooth metal, projecting inwardly one inch, and sloping forty-five degrees, as may be seen in the sections of the frame and board, figs. 10 and 11. The object of the tin is to prevent the grub from ascending. Over this the board is to be placed, with the hole, *k*, fig. 7, corresponding with that in the plank of the frame, *l*, fig. 8. All that part of the board, *m, n, o, p*, fig. 7, which covers the inside of the frame, is to be cut into openings, three eighths of an inch wide and one inch asunder, corresponding with the mortises in the cover. Between the cover and the tin is to be a slide, fig. 12, of the size of the inside of the frame, for the purpose of excluding the light when clearing the machine. The back side of the frame is to be used as a door, and kept in place by the springs, *g, r*, fig. 13. This machine is to be placed near the walls, with the hole in the plank over that in the floor, and the hive kept on it at all times when there is a scarcity of flowers. By the use of this machine, a hive infested with grubs, or other foreign matter, may be cleared of them, as they will fall through the openings in the fore part of the season, and may be taken out without disturbing the bees. It is also to be used whenever it may be necessary to feed the bees. On the approach of cold weather, the machine with the hive on it, is to be moved back from the walls so far as to close the avenue; the hole in the plank must be closed by the small slide, fig. 9; the large slide removed, and the machine filled with cut straw, or other dry material, and the space between the wall and the hives filled with straw. Other covering should be placed on and about the hives, and removed in the spring. The hives should be made in a workman-like manner, of good timber, and all parts smooth except the bottom of the cover.

RECOMMENDATION.

The subscribers have for some years past resided near John Scarle, Esq., of Franklin, N. H., the inventor of a new and improved method of "constructing Bee Houses and Bee Hives."

We have had occasion to examine one of the houses, and the hives in the same, built upon the principles laid down in this patent, and to notice the operations of the bees in the same.

We find one of the greatest advantages of this system to consist in the preservation of the life of this useful insect. We rejoice to find it no longer necessary to destroy this pattern of industry, when we would enjoy the fruits of its labor. By adopting this improvement "we can live and let live," making a division of capital when interest and convenience shall demand.

We also find this improvement to be a safe defence to the attacks of most of the enemies of the Bee, more especially the moth or miller. The House is so constructed as to preserve an even temperature of air about the hives, avoiding thereby the dangerous effects of cold, or heat, or of an atmosphere too moist. The house is also so constructed as to allow easy access to any or all of the hives, so that necessary food may be supplied, honey taken away, additional hives or boxes placed where found necessary, and all robbers or plunderers can at any time be barred out, and good order be constantly preserved in the family.

Franklin, Feb. 21, 1839.

The cost of erecting one of these Bee Houses with 36 hives, together with the right of the patent, is little more than about \$50.

DR. ADAM PAGE is agent for the patentee at Rochester, No. 26 Exchange-st.

On Propagation by Seeds and Cultivation.

In order to have good vegetables, herbs, fruits, and flowers, we must be careful and diligent in the propagation and cultivation of the several plants; for, tho' nature does much, she will not do all. He who trusts to chance for a crop, deserves none, and he generally has what he deserves.

The propagation of plants is the bringing them forth, or the increasing and multiplying of them.—This is effected in several different ways: by seeds, by suckers, by offsets, by layers, by cuttings. But bear in mind, that all plants, from the Radish to the Oak, may be propagated by the means of seeds: while there are many plants which can be propagated by no other means; and, of these, the Radish and the Oak are. Let me just qualify, here, by observing, that I enter not into the deep question (which so many have puzzled their heads with) of *quirical generation*. I confine myself to things of which we have a certain knowledge.

With regard to propagation by means other than that of seed, I shall speak of it fully enough under the names of the several plants, which are, as to the way of propagating them, to be considered as exceptions to the general rule. Therefore I shall in the present chapter, treat of propagation by seed only.

Cultivation must of course differ in some respects; to suit it to certain differences in the plants to be cultivated; but there are some principles and rules which apply to the cultivation of all plants; and it is of these only that I propose to speak at present.

It is quite useless, indeed it is grossly absurd to prepare land, and to incur trouble and expense, without duly, and even *very carefully*, attending to the seed we are going to sow. The *soil*, the *genuineness*, the *soundness*, are all matters to be attended to, if we mean to avoid mortification and loss. Therefore the first thing is, the

Sort of Seed.—We should make sure here; for what a loss to have late cabbages instead of early ones! As to beans, peas, and many other things, there cannot easily be mistake or deception. But, as to cabbages, cauliflowers, turnips, radishes, onions, leeks, and numerous others, the eye is no guide at all. If, therefore, you do not save your own seed, (of the manner of doing which I shall speak by and by,) you ought to be very careful of whom you purchase of; and though the seller be a person of perfect probity, he may be deceived himself. If you do not save your own seed, which, as will be seen, cannot always be done with safety, all you can do, is to take every precaution you can when you purchase. Be very particular, very full and clear, in the order you give for seed. Know the seedsman well, if possible. Speak to him yourself on the subject if you can; and, in short, take every precaution in your power, in order to avoid the mortifications like those of having one sort of cabbage when you expected another, and of having rape, when you expected turnips or rutabaga.

True Seed.—But, besides the kind, there is the *genuineness* to be considered. For instance, you want *sugar-loaf cabbages*. The seed you sow may be cabbage; it may be, be sugar loaf, or more than any thing else; but still, it may not be *true to its kind*. It may have become degenerate; it may have become *mixed or crossed* in germinating; and thus the plants may very much disappoint you. *True seed* is a great thing; for, not only the time of the crop coming in, but the quantity and quality of it greatly depends upon the truthness of the seed. You have *plants*, to be sure; that is to say, you have something growing; but you will not, if the seed be not *true*, have the thing you want.

To *insure* true seed, you must, if you purchase, take all the precautions recommended as to sort of seed. It will be seen presently, that to save true seed yourself, is not a very easy matter. And therefore, you must some times purchase. Find a seedsman that does not deceive you, and stick to him. But observe, that no seedsman can always be sure. He cannot raise all his seeds himself. He must trust to others. Of course, he may, himself, be deceived. Some kinds of seed will keep a good many years; and therefore, when you find you have got some *very true* seed of any sort, get some more of it; get as much as will last you for the number of years that such seed will keep.

Soundness of Seed.—Seed may be of the right sort; it may be true to its sort; and yet, if it be *unsound* it will not grow, and of course is a great deal worse than useless, because the sowing of it occasions loss of time, loss of cost of seed, loss of use of land, and loss of labor, to say nothing about the disappointment and mortification. Here again, if you purchase, you

must rely on the seedsman; and therefore all the information and precautions are necessary, as to this point also. In this case (especially if the sowing be extensive) the injury may be very great; and there is no redress. If a man sell you one sort of seed for another; or, if he sell you untrue seed, the law will give you redress to the full extent of the injury proved, and the profit can be produced. But if the seed does not come up, what proof have you? You may prove the sowing, but who is to prove that the seed was not chaffed or scathed in the ground? That it was not destroyed in coming up, or in germinating?

There are however, means of ascertaining whether seed be sound or not, before you sow it in the ground. I know of no seed, which, if sound and really good, will not sink in water. The unsoundness of seed arises from several causes. Unripeness, blight, mouldiness and age, are the most frequent of these causes. The two first, if excessive, prevent the seed from ever having the germinating quality in them. Mouldiness arises from the seed being kept in a damp place, or from its having leached. When dried again it becomes light. Age will cause the germinating qualities to evaporate; though, where there is a great proportion of oil in the seed, this quality will remain in it many years.

The way to try seed is this: put a small quantity of it in lake warm water, and let the water be four or five inches deep. A mug or basin will do, but a large tumbler glass is best; for then you can see the bottom as well as top. Some seeds, such as those of cabbage, radish and turnip, will, if good, go the bottom at once. Cucumber, melon, lettuce, endive, and many others, require many minutes. Parsnip and carrot, and all the winged seeds, require to be worked by your fingers in a little water, and well wetted, before you put them into the glass; and the carrot should be rubbed so as to get off part of the hairs, which would otherwise act as the feathers do as to a duck. The seed of beet and mangel wurzel are in a case or shell. The rough things that we sow are not the seeds, but the cases in which the seeds are contained, each case containing from one to five seeds. Therefore, the trial by water is not, as to these two seeds, conclusive, though, if the seed be very good, if there be four or five in a case, shell and all will sink in water, after being in the glass an hour. And as it is a matter of such great importance, that every seed should grow in a case where the plants stand so far apart; as gaps in a row of beets and mangel wurzel are so very injurious, the best way is to reject all seed that will not sink, case and all, after being put into hot water and remaining there an hour.

But seeds of all sorts are sometimes, if not always, part sound and part unsound; and as the former is not to be rejected on account of the latter, the proportion of each should be ascertained if a separation be not made. Count then a hundred seeds, taken promiscuously, and put them into water as before directed. If fifty sink and fifty swim, then half your seed is bad and half good; and so in proportion to other numbers of sinkers and swimmers. There may be plants, the sound seed of which will not sink; but I know of none. If to be found in any instance, they would, I think, be found in the tulip-tree, the ash, the birch, and the parsnip, all of which are furnished with so large a portion of wing. Yet all these, if sound, will sink, if put into warm water, with the wet worked a little into the wings first.

There is however, another way of ascertaining this important fact, the soundness or unsoundness of seed; and that is by *sowing* them. If you have a *hot bed*; or if not, put a hundred seeds, taken as before directed, sow them in a flower pot, and plunge the pot into the earth under the glass in the hot bed, or hand glass. The climate under the glass is warm; and a very few days will tell you what proportion of your seed is sound. But there is this to be said, that, with strong heat under; and with such complete protection above, seed may come up that would not come up in the open ground. There may be enough of the germinating to cause vegetation in a hot-bed, and not enough to cause it in the open air and cold ground. Therefore, I incline to the opinion that we should try seeds as our ancestors tried witches; not by fire, but by water; and that, following up their practice, we should repobate and destroy all that do not readily sink.

Sowing and Preserving Seed.—This is a most important branch of the gardener's business. There are rules applicable to particular plants. Those will be given in the proper places. It is my business here to speak of such as are applicable to all plants.

First, as to the sowing of seed, the most plants should be selected, such as are of the most perfect shape and quality. In the cabbage we seek small

stem, well formed leaf, few spare or loose leaves; in the turnip, large bulb, small neck, slender-stalked leaves, solid flesh or pulp; in the radish, high color (if red or scarlet,) small neck, few and short leaves, and long top. The marks of perfection are well known; and none but perfect plants should be saved for seed.—The case is somewhat difficult as to plants, which are the same male and others female, but these present exceptions are to be noticed under the names of such plants.

Of plants, the only sowing of which is a circumstance of importance, the very earliest should be chosen for seed; for they will most always be found to include the highest degree of perfection in other respects. They should have great pains taken with them; the soil and situation should be good; and they should be carefully cultivated during the time that they are carrying on their seed to perfection.

But excellent means must be taken to prevent a mixing of the sorts, or, to speak in the language of farmers, a *crossing of the breeds*. There can be no cross between the sheep and the dog; but there can be between the dog and the wolf; and we daily see it between the greyhound and hound; each valuable when true to his kind; and a cross between the two, fit for nothing but the rope; a word which, on this occasion, I use in preference to that of *halter*, out of respect for the modern laws and usages of my native country.

There can be no cross between a cabbage and a carrot; but there may be between a cabbage and a turnip; between a cabbage and a cauliflower, nothing is more common; and as the different sorts of cabbages, they will produce crosses, presenting twenty, and perhaps a thousand degrees from the Early York to the Savory. Turnips will mix with radishes and ruta baga; all these with rape; the result will mix with cabbages and cauliflowers: so that, if nothing were done to preserve plants true to their kind, our gardens would soon present us with little besides mere herbage.

Suffice it now, that we know that sorts will mix, when seed plants of the same tribe stand near each other; and we may easily suppose that this may probably take place though the plants stand at a considerable distance apart, since I have, in the case of my Indian corn, given proof of mixture when the plants were *three hundred yards from each other*. What must be the consequences then of saving seeds from cucumbers, melons, pumpkins, squashes, and gourds, all growing in the same garden at the same time? To save the seed of two sorts of any tribe, in the same garden, in the same year, ought not to be attempted; and this it is, that makes it difficult for any one man to raise all sorts of seeds, good and true.

However, *some* may be saved by every one who has a garden; and when raised, they ought to be carefully preserved. They are best preserved in the pod, or on the stalks. Seeds of many sorts will be perfectly good to the age of eight or ten years, if kept in the pod or the stalks, which seeds, if threshed, will be good for little at the end of three years or less. However, to keep seeds without threshing them out, is seldom convenient, often impracticable, and always exposes them to injury from mice and rats, and from various other enemies, of which however, the greatest is carelessness. Therefore, the best way is, except for things that are very curious, and that lie in a small compass, to thresh out all seeds.

They should stand till perfectly ripe, if possible.—They should be cut, or pulled, or gathered, when it is dry; and they should, if possible, be dry as dry can be, before they are threshed out. If when threshed, any moisture remain about them, they should be placed in the sun, or near a fire in a dry room; and when quite dry, should be put into bags, and then hung up against a very dry wall, where they will by no accident get damp. The best place is some room, or place, where there is, occasionally at least, a fire kept in winter.—*Silk Grower.*

Newspapers.

A child beginning to read, becomes delighted with a newspaper, because he reads of names and things which are very familiar, and he will make a progress accordingly. A newspaper in one year, says Mr. Weeks, is worth a quarter's schooling to a child, and every father must consider that substantial information is connected with this advancement. The mother of a family being one of its heads, and having a more immediate charge of the children, ought to be intelligent of mind, pure in language, and always cheerful and circumspet. As the instructor of her children, she should herself be instructed.

A mind occupied, becomes fortified against the ills of life, and is braced for any emergency. Children, amused by reading and study, are of course considerate and more easily governed.

How many thoughtless young men have spent their evenings in a tavern or grog-shop, which ought to have been devoted to profitable reading! How many youths who never spent twenty dollars for books for their families, would gladly have given thousands to buy a son or daughter, who had ignorantly and carelessly fallen into temptation!

Weekly newspapers can be had from one to three cents per year, being from two to five cents per copy.

Each paper cost the printer, before it is printed, about one cent. He, therefore, obtains from one or two cents for his editorial duties, and for printing, editing, composition, &c. This is extremely low. It is the price paid for advertisements which keep newspapers alive.

Let the readers of newspapers get the *cheapest* of possible reading.

Thirteenth Annual Fair of the American Institute.

This great Anniversary Exhibition of the choice products of Agriculture, Manufactures, and the Arts, is open to visitors at Niblo's Garden, in the city of New York, on Monday, the 5th of October, 1840. It is open for competition, in order to be entitled to all the privileges of the Fair, must be delivered on the 4th or 5th of October, at 8 o'clock.

An Address on "*Home production, and particularly of Silk*," will be delivered at the Repository of the American Institute, on Wednesday evening, the 6th of October, at 8 o'clock.

On Friday, the 9th of October, at 3 o'clock, P. M. a Ploughing Exhibition, for testing such ploughs as have been entered for competition at the Fair, will be held in some suitable field near the city, which will hereafter be noticed in the public prints. It will be conducted by a committee, selected from the Board of Managers and the Board of Agriculture.

On Wednesday the 11th of October, at 12 o'clock, the Exhibition of pure blood Cattle and choice young Live Stock will be made within or near the city. As they will be selected by the Judges for the purpose, they must be entered on the books of the Fair by 12 o'clock on Tuesday, the 13th of October.

Last year, inconvenience was experienced from the cattle, &c. being placed at a distance from the main exhibition; to remedy which arrangements were made for receiving them in the neighborhood of Niblo's Garden, where they will be taken care of at a moderate per diem charge for each head, previously defined by the committee, so as to prevent objections on strangers. They will be subjected to no other charge.

On Thursday evening, October 15th, at 7 1/2 o'clock, an Anniversary Address will be delivered in some public building in the city, and will be succeeded by a musical Supper the same evening.

On Friday evening, the 16th of October, the 13th Fair will close, with the public announcement of the prizes awarded, and an Address by the President of the Institute.

On Saturday, the 17th of October, the earliest hour, a Silk Exhibition will be delivered, on the exhibitor presenting to the attendant the receipt or check given by the Clerk of the Fair. And the owners of silks are earnestly requested to remove them in the city of the day.

More than twelve years have elapsed since a few gentlemen in behalf of the cause of industry first met at the American Institute into existence. For 17 years after its organization, it was dependent on all voluntary contributions from individuals. In 1825, seven years after its first organization, by the liberal services of its members, and by great economy, it had accumulated a small fund. It was then determined to establish a Repository, for the daily exhibition of Machines, Models, &c., with a Library, a benefit of Mechanics, Artists, Inventors, &c.; an extensive room was leased, and an officer was appointed with a salary to superintend the same. In 18 years which have succeeded, the Institute has prospered triumphantly.

Ploughing and Cattle Exhibitions have been since introduced, and steam power for moving machinery at the Fairs upon a large and costly scale. The prizes of gold and silver medals, under the awards, which, before 1835, had been in a measure made up of uncollected contributions in small sums, have since been paid for solely from the funds of the Institute, and a greater amount in a single year than all that had been bestowed by the Institute in the seven preceding years. And our annual Fairs have gone on increasing in variety and splendor, unsurpassed by any other Fairs ever held within the limits of our country. At the same time, taking into view the in-

crease of our Library, machinery, models, furniture and fixtures, the value of our assets has not diminished, while the number of paying members have multiplied four-fold.

The American Institute is a magnificent standing evidence of the efficacy of the spirit of association, which in this age is accomplishing such mighty results. Its influences, (unremitting for thirteen years,) through its annual Fairs, annual Addresses and Premiums, have reached every part of our country. By creating extended competition, the latent powers of invention have been brought into action far and near, and disheartened and prostrate genius has been roused up in the midst of universal embarrassment with renewed strength. Old and dormant institutions have, by its example, been roused and invigorated, and the creation of new ones has been induced, that had not been thought of before, which now hold their periodical celebrations upon the precise plan first adopted by this Institute.

What measure can circumscribe the extended utility of that small meeting, where the idea of this Institute was first accidentally named! But its prosperity and continuance have rested, and will continue to rest, on public favor. Its guardians are the friends of industry, and as it is a National Institution by the terms of its charter, the aid of its friends in every state may be relied upon with unerring certainty.— The coming celebration will afford an opportunity for their friendly manifestations.

Much of the attention of the Managers will be devoted to Agriculture. They will be aided by the Board of Agriculture, composed chiefly of practical farmers. The Plough, the great instrument of human sustenance and civilization, will claim their first regard; and such as may be sent to the coming Fair for competition, will be tested by actual experiment. The competition already excited, has brought invention and skill to bear upon this instrument, and it is believed Ploughs made for the purpose, essentially improved, will be exhibited at the Thirteenth Fair. The displays of the select productions of the Garden and the Field promise to be more abundant than ever.

Not the least interesting portion of the last Exhibition were the noble high blood animals, the Cattle, &c. from this and other states. It is hoped that those public spirited gentlemen who took such a deep interest last year, will appear again with increased zeal, and that others will follow their example.

Improved Agricultural Machines and Implements of all kinds are desirable objects of exhibition. The occasion will afford the best opportunity for their display, and for our farmers to learn the multiplied improvements in Agricultural Labor-saving Machines, which have not until recently received from them the attention their value demands. It is believed that the Mechanic Arts are competent, if properly applied for this purpose, to dispense with a large proportion of the heavy labor and drudgery heretofore deemed indispensable to farming operations. The Steam Machinery will be so adapted, as to propel the lighter and more delicate machines, and also of sufficient power to move those more massive and ponderous.

No farmer whose convenience will by any means admit, should forego this opportunity.

The progress in the culture and manufacture of Silk the last year, and the preparations making for the coming Fair, promise a rich treat to those who feel an interest in this new branch of industry; and the experience of this year, we think, will demonstrate that the Mulberry possesses an intrinsic, as well as a speculative value.

Exhibitors of Silk will do a service by accompanying their contributions with accurate details of their experiments.

The large and growing importations of Silk fabrics have done much to produce the general embarrassments which have prevailed, and which can be readily remedied by increased home production. It is our policy to follow the example of Great Britain, by limiting as much as possible the importation of such articles as can conveniently be produced within the country. A Gold Medal will be awarded for the Silk Reel, adjudged the best.

The accommodations of the Garden, in consequence of the improvements made since the last year, will be more complete than ever; not only for the display of assortments of the best qualities of staple goods from our larger factories and workshops, but likewise for the more delicate workmanship of the artificer, in all the varieties of wood and metals, and the numberless other substances that every year brings into use. These, when arranged in the great saloon, present a spectacle which excites the admiration of those familiar with the most costly and gorgeous displays of Lon-

don or Paris; and on which the American patriot gazes with glowing exaltation. But it is in the apartment devoted to machinery for labor-saving purposes, where the strong original characteristics of American genius are most strikingly exemplified, and where even the foreigner reluctantly acknowledges the superiority of our youthful country.

The American Institute has, from its commencement, always been the favorite Institution of the ladies, and the Managers hope it may so continue. Much of the celebrity of the annual Fairs, particularly in the ornamental parts, has arisen through their favor, and the attractions their industry and delicate labor have produced. Indeed, on most occasions, the view of their contributions alone would have more than compensated the visitors. The most desirable places will be allotted for their accommodation.

The Managers, perhaps, may be expected to notice the publications made, pending the late election, against the officers and members of the Institute, by certain numbers calling themselves *Reformers*. But in doing this they think no more is necessary than to state, that a proper anxiety has been felt by the officers and a majority of the members of the Institute, to cause a thorough investigation into the truth or falsity of these imputations, and that for this purpose two committees have been appointed, and their reports have entirely exonerated the Institute, its officers and members, from the charges so often reiterated, but never proved. It is remarkable, that though the misapplication of the moneys of the Institute was charged and repeated in the public papers against its Officers and Managers, the accusers did not even attempt, before either committee, to show that a dollar had ever been applied to except the legitimate objects of the Institute. And in all the charges that related to the faithful awarding of the premiums to meritorious competitors, for 12 years, it was unequivocally proved that each successive Board of Managers, had conducted with the most scrupulous regard to justice, and under the continually pervading sentiment, that on this depends, more than upon any other consideration, the honor, dignity and usefulness of the American Institute.

But as the action of the Institute within its own walls might not satisfy the whole public that its affairs had been conducted so entirely without fault as they have been, it has been deemed advisable to resort to the public tribunal of the country, for that perfect vindication to which the public, and contributors for our Fair especially, are entitled.

For this purpose a resolution was adopted at the last stated meeting, by a vote of nearly three to one, directing legal proceedings to be commenced against certain members, which is the best evidence of the confidence of the Institute in its own integrity.

The Managers will conclude in the words of the circular of the Twelfth Annual Fair, which they deem not less appropriate this year, than they were last.

"If within the short space allowed for receiving, entering, arranging, and delivering articles, amidst the throngs of the exhibitors and visitors, some errors should occur, or some omissions happen, which provoke the vociferations of disappointed expectations and passions, or which inconsiderate wantonness may distort and magnify—still, we trust, a reflecting and liberal public will not expect the Managers to be diverted from their arduous, engaging and important duties to indite contradictions and replies. Twelve years of faithful, disinterested devotion to a cause which lies near the heart of every genuine American, have placed the American Institute in a position from which it cannot be expected to descend to repel attacks which have always proved harmless in effect, whatever may have been their design."

Editors of papers friendly to the cause of national industry, are requested to give this Circular one or more gratuitous insertions.

The Repository is open for the daily reception and exhibition of Machines, Models, Specimens, &c. of limited dimensions, at the spacious room known heretofore as the Sessions Room, in the Park, (rear of the City Hall,) free of charge, both for contributors and visitors. Those most meritorious will be conveyed to the Fair, at the close of which they will be returned by the Managers. Subscriptions are received at the Repository for the new series of the Journal of the American Institute, at \$2 per annum. Persons disposed to patronize this publication, will please forward their names and places of abode. The first number will issue as soon as the list of subscribers will warrant.

Repository of the American Institute,
New York, July 1840

Hints for the Month.

One of the most important things during this month, is sowing wheat. In this region, and wherever the Hessian fly is not to be found, sow early; let the crop be well put in,—farmers who employ hired men, should see that ploughing is not slighted, and that narrow, even furrows be ploughed, instead of cutting slices of soil twice as wide as can be turned over. Let good, well cleaned surface drains be cut wherever needed.

In fattening hogs, let it be remembered, that a great loss always follows the feeding of unground grain—that fermented swill (*hog-purri-ge*) is much better than unfermented—and that meal boiled in many times its bulk of water is still better. One item in the management of hogs, from an exchange paper:—"Six pigs of equal weight were put to keeping at the same time, and treated alike as to food and litter for seven weeks. Three of them were left to shift for themselves as to cleanliness. The other three were kept clean by brushing and currying. These last pigs consumed in the seven weeks, five bushels of peas less than the others; and when killed, weighed, on an average, more than two stone four pounds (32 lbs.) above the others."

Hogs should now be turned into apple orchards to pick up the fallen fruit:—some farmers accomplish most of the fattening of their hogs in this way, without interfering with the main crop of winter apples.

Let cattle be well kept through autumn—if for fattening, the work should be commenced early—and if for keeping, it is important that they should enter winter in fine condition.

Newly seeded grass lands should be very sparingly fed, so that the young plants may get a secure footing and spread densely over the surface.

Be careful to cut up corn in season, that the fodder may be good—if a heavy frost should occur before the end of the month, it should be cut before it withers. Corn will ripen much, after cutting, by the nourishment it receives from the slowly drying stalks. Topping corn should never be practiced—it lessens the amount of grain, often several bushels to the acre,—affords much less fodder, and requires more labor.

As much of the plan of operations for next year, is laid now, it is especially important that it be done right. A course of rotation should be always attended to, as this is of the highest importance in practice in order that other labor may not be lost. Manuring is of absolute necessity, but not less requisite than rotation—manuring costs money,—rotation costs only careful thought;—and without rotation, a great part of the advantages of manuring, and thorough culture, will be lost. If a hundred dollars a year can be saved by mere thought, without additional labor, it is certainly worthy of attention; but many farmers sacrifice hundreds by a bad system.

Let ENERGY—NEATNESS—ORDER,—be the watchword of the farmer at every season of the year, and success will follow.

The Yellows in Peach Trees.

All cultivators of the peach tree, should know how to distinguish the effects of the worm at the root—a mechanical injury, from the poison of the yellows—a contagious disease.

This name was imposed by the late Judge Peters of Pennsylvania; and though it is sometimes descriptive, yet in other cases, it may mislead, for the tree may be deeply diseased, and yet not yellow. So it is, perhaps generally, when the malady first appears in the fruit; and is probably the effects of pollen from an unhealthy tree. In this case, one or two limbs may ripen several weeks before the other branches,—the skin of an deeply stained or speckled with red-purple, as well as the pulp; and this may be the only symptom discoverable in that season. As the disease increases

however, shoots protrude from the main branches, often crowded and remarkably attenuated, such as no healthy tree ever exhibits.

When we first introduced this disease from one of the Flushing nurseries, we were entirely ignorant of its nature; and to preserve a few sorts which had come at high prices, we set some buds from those slender twigs, into healthy stocks. They took, but communicated the malady, and in about one year they all died together.

It is supposed that the yellows is also taken by healthy trees through the root in consequence of their coming in contact with infected roots; and of this we could have no doubt, if a transfusion of the juices should take place; but our observations favor the belief that it is more commonly communicated by the pollen, and perhaps through the intervention of bees.

As the pulpy part of the fruit is evidently diseased, it is reasonable to infer that the kernel is also tainted; and the early age at which seedlings often die in the infected districts, confirms this opinion. To plant such peach stones in nurseries, is therefore equivalent to sowing the yellows over the land. None should be used for this purpose, but such as are procured from the most healthy trees.

The only known remedy for this disease is to kill the patient. A tree has no stomach into which we can throw medicine; and external applications only smother by closing the pores. Some persons indeed, have made holes in the limbs or trunk, and filled in mercury or sulphur,—analogous to cutting into the flesh, and cramping the orifice with drugs—but we have nothing to say in favor of the practice. If a tree could be medicated through the spongioses perhaps something might be done;—and some cases of mercury and of salt having entered separately into the circulation, have been recorded,—but this branch of medical practice has hardly commenced. Where only a limb or two appear to be diseased however, immediate amputation might be tried; yet there would be much reason to apprehend a taint of the trunk, in consequence of the natural descent of the juices. †

Culture of Fruit--Continued.

We have already noticed some of the best varieties of the apple, peach, pear, and cherry; and before proceeding to treat of the most successful modes of culture, we shall mention briefly a few of the best among the apricot, raspberry, strawberry, plum, &c.

The apricot is very much neglected by most cultivators of fruit in this region, although it ripens before the earliest peaches, and is little inferior to them in flavor; certainly far exceeding, as a table fruit, the finest varieties of apples. Its tenderness, and the occasional loss of the crop by frost, are the chief objections; but it withstands well, the winters of Western New York, and the fruit is not perhaps more frequently destroyed than the peach, not being cut off in our milder regions oftener than one year in four. With the plum and nectarine, it is liable to the attack of the curculio, but is protected from that insect with the same facility and certainty by a little care.

The Peach apricot stands pre-eminent for size and flavor, often measuring more than two inches in diameter. It ripens with the wheat crop, a little earlier than our earliest peaches; and should be considered as indispensable in every fruit garden, though containing but half a dozen trees. The *Breda* is inferior to the peach apricot, but is earlier, and the crop is perhaps more certain. The *Black* apricot is quite distinct from all the other varieties, and inferior to many in flavor, but it is perfectly hardy, is a great bearer, and ripens its fruit a little before our wheat harvest. Though not admired by some, it still should obtain a place in every collection.

Among the finest varieties of the PLUM, for earliness, and for flavor, are the *white Primodian*, ripening in harvest,—the *Orleans*, ripening soon after *Yellow Gage*, *Green Gage*,—*Bolmar's Washington*, remarkable for its size and beauty, but not for flavor,—*Huling's Superb*, superior in size and flavor to the last, and *Prince's Imperial Gage*, which, according to Manning, is "the most productive and profitable of all plums," a single tree, according to Kenrick in the vicinity of Boston, having produced fruit several successive years, which sold for forty to fifty dollars per annum.

Among raspberries, the *Red Antwerp*, and *White Antwerp*, are considered as standing at the head. Two varieties, known to nurserymen, as *Black American* and *White American*, are also excellent, but need good culture to be as they should; a native American species, the *Rubus strigosus*, possesses an excellent flavor, would doubtless be much improved by cultivation.

Strawberries.—The *Duke of Kent Scarlet*, is a flavored and very early variety; the *Roseberry* is larger and more productive; Keen's seedling is a large, fine and very productive variety; the *Methven* is more remarkable for size, than for flavor or productiveness. The *red* and *white Alpine* are sweet and of a good flavor, and are chiefly valuable for their constant bearing through the summer, especially if a little shaded; fruit may generally be picked until severe frosts set in. The *bush Alpine* appears to be inferior to the last, both in flavor and productiveness.

It is certainly a matter of surprise, that so little attention is given to the cultivation of fine fruit. A quarter of the needless expense which is often lavished on fine horses, or on fine carriages and harness, would procure a constant succession of this most delicious, this absolutely bewitching treat, through the whole yearly circle! For instance,—apples will supply from the first of the year to the beginning of summer; strawberries, cherries, and raspberries a month and a half longer; apricots for a month and during wheat harvest; and after that the multitude of delicious fruits, consisting of apples, pears, plums, peaches, nectarines, grapes, &c., will give an abundant supply till winter; after which pears and apples would continue till spring, and apply to the fruit season of the next year.

(To be Continued.)

The Basano Beet.

This Beet is more decidedly turnip-shaped than that we have cultivated; and we have some that are seven inches across the top. It is quite a favorite in our family; and some others who have tried it pronounced it very superior. It was sent to us from the Rochester Seed Store; was imported from England, and has grown as freely as any that we have ever planted. On account of its excellence, we have saved all that we have now left.

The Alsike Clover.

The Alsike clover seed (a present from the Rotterdam Seed Store) has grown well. Without a close inspection it might be mistaken for white clover—a near approach shows it to be a different thing. Its leaf, indeed, resembles that species; and its flowers also, though they have more redness,—a part standing erect, while the older parts of the head loop down. Like the white clover, it has also a tap root; but unlike it, such of the stems as are prostrate, do not root, as far as we have been able to observe. In standing and erect branches, it resembles the white clover.

Its value as an artificial grass in this country, will be determined by future observations and experiments. It was sown on a fertile soil; and its erect stems

high, while those which are flanting and pro- are longer, some of them eighteen inches in h. Perhaps a lighter soil might suit it better. appearance is more vigorous than the white clover; we think the red clover in the same situation d be more productive. If its prostrate stems d take root, its value would be greatly increased. T.

A Cure for the Heaves in Horses.

ESSRS. EDITORS—I observed in your paper an in- for a cure for the Heaves in horses. the spring of the year, take one ten-spoonful of Petre, and another of Borax, powdered fine, put in meal, and feed the horse three such doses in twenty-four hours of each other; then double ose for three times more, and in a few weeks the res will disappear. I have tried it with complete 298. J. DUNHAM.

na, Tompkins co., N. Y. 1840.

Ontario County Agricultural Society.

mentioned in our last that an Agricultural So- had been formed in Ontario county. We now a more particular account of it, and are happy to hat its proceedings give evidence of much spirit, promise great usefulness. We hope to witness xhibition at Canandaigua, on the 20th of October, ch will speak well for old Ontario. The Consti- adopted by the society is of the usual form for ity societies: annual fee one dollar. The follow- ia list of the officers and town committees for present year:—

- resident, JOHN GREIG,
 - Vice do. GIDEON LEE,
 - do. do. HEMAN CHAPIN,
 - do. do. PETER MITCHELL,
 - do. do. LYMAN HAWES,
 - do. do. WILLIAM OTTLEY,
 - do. do. IRVING METCALF.
- Recording Secretary, William W. Gorham.
Corresponding Secretary, Oliver Phelps.
Treasurer, James D. Bennis.

TOWN COMMITTEES.

- anandaigua.—Charles Shepard, Russel B. John- and Caleb Gage.
 - andic.—Hiram Colegrove, Josiah Jackman and rester Anstin.
 - Vest Bloomfield.—Reynold Peck, Jasper C. Peck, Bezaluel C. Tafi.
 - ust Bloomfield.—Flavins J. Bronson, Bani Brad- and Myron Adams.
 - ristol.—Francis Mason, Erastus H. Crow and on Packard.
 - outh Bristol.—Franklin Crooker, Allen Brown, James Psrimely, Junr.
 - orham.—Ephraim Blodget, Adam Foke and Da- Picket.
 - topcevell.—Joel S. Hart, Arunah Mesely and Eli- F. Miller.
 - anchester.—Nicholas Howland, Edmund B. Dew- and Abner Barlow, Junr.
 - Vaples.—Alanson Watkins, Ephraim W. Cleave- d and James L. Monier.
 - armington.—Russell M. Ruah, Wilmarth Smith, Perez Hathaway.
 - Richmond.—Hiram Pitts, Robert L. Rose and Si- Reed.
 - Seneca.—Robert C. Nicholas, Abraham A. Post l Charles Godfrey.
 - Victor.—William Bushnell, Azariah Bickford and a Ball.
 - Phelps.—Elias Cost, William Dickerson and Peter andricks.
- The Executive Committee have announced that the Annual Cattle Show and Fair will be held at Canan- gua, on Tuesday the 20th day of October, at which e a ploughing match will be held, an address de- lered, and premiums awarded for the best an- ds of farm stock, crops of grain and Roots, articles omestic manufacture, and agricultural implements. list of articles and the amount of premiums, is pub- lished in the Canandaigua papers. The aggregate a- ount offered is \$500. This speaks well for the new

society in these times of pressure. Every farmer in the county ought immediately to have his name en- rolled as a member.

The Genesee County Agricultural Society.

The annual Cattle Show and Fair of this Society will be held at Alexander the 14th day of October— (not at Batavia as mentioned in our last.) The fol- lowing is a list of the Officers and Managers of the Society :

- President, THEO. C. PETERS, of Darien.
- 1st Vice do. E. BISHOP, of Attica.
- 2d, do do. WILLIAM E. HESTON, Batavia.
- 3d, do do. F. P. PENDELL, “
- 4th, do do. G. A. BRIGGS, “
- 5th, do do. L. C. DRAPER, Alexander.
- 6th, do do. LEVERITT PECK, Bennington.
- 7th, do do. LEWIS CLARK, of Darien.
- 8th, do do. CYRUS BROWN, Pembroke.

C. P. Turner, Esq. of Batavia, Corresponding and Recording Secretary.

Lewia E. Heaton, of Batavin, Treasurer.

MANAGERS.

- O. Dinamore, Alabama,
- George Cooley, Attica,
- O. T. Fargo, Alexander,
- Sam'l Richmond, Bergen,
- J. G. Russell, Batavia,
- John Jenny, Bethany,
- Chauncy Hlayden, Bennington,
- E. Cash, Byron,
- Jaa. C. Ferriss, Covington,
- Silas Parker, China
- S. D. Tabor, Castile,
- A. Jefferson, Darien,
- G. Decky, Elba,
- Nysom Reynolds, Gainesville,
- John Parish, Java,
- B. Murphy, Le Roy,
- Orlando Kelley, Middlebury,
- W. Lewis, Orangeville,
- Peter Patterson, Perry,
- Eli Allen, Pembroke,
- Pomeroy Warner, Sheldon,
- I. N. Stage, Stafford,
- Elijah Norton, Warsaw,
- Horace Gibbs, Weathersfield.

The annual fee for membership of this Society is only fifty cents, and certainly no farmer in the county can, or ought to, refuse his name and mite in aid of so laudable an enterprise. Several warm friends of ag- riculture have subscribed largely, and given much time and labor in aid of the Society, and if the form- ers of Genesee will consult their own interests, they will lend their hearty co-operation; then great benefis will result from the Society to that rich agricultural county.

* * Our readers will be careful not to confound the name of the Genesee County Society, with that of the Genesee Society which has its meetings at Roch- ester. The former is intended for Genesee county alone; the latter is intended for several counties, or all Western New York. At the time of its formation it was not known that a Society was in contemplation for Genesee county; and in order to avoid confusion it is probable that its name will be changed at the an- nual meeting.

Late Sales of Improved Cattle.

The following accounts of prices obtained at late sales of improved cattle, afford gratifying evidence that the panic among farmers is beginning to disap- pear, and that the cause of improvement will not long be paralyzed by the cry of “hard times.”

Joseph C. Hathaway of Farmington purchased a few days since of Thomas Weddle, of Greece, near this city, his imported Durham Short Horn Cow, “Lady Bower,” with her bull calf, “Welham,” 7½ months old, by “American Comet,” for the sum of one thousand dollars.

At a late sale of stock belonging to Allen Brown, South Bristol, Ontario co., his full blooded Durham

Bull, “Echo,” from Mr. Weddle's imported stock, sold for \$580; and his Cow, “Beauty,” from the same stock, with her two calves, sold for \$890.

The following account of a late sale of Durham cat- tle at Franklin, Kentucky, we copy from the Franklin Farmer.

Sale of Cattle.—The sale of Cattle by the Fayette Cattle Importing Company, was made on the day pre- viously advertised. The sale was numerously at- tended, by farmers from all our adjoining countie, and the herd was very well distributed. The prices for the times, we suppose, were fair excepting those of the bulls, Carcass and Eolus, which for their cost should have sold higher. Carcass came to America with a great reputation as a prize bull; it was therefore ap- posed he would have brought a better price. We infer from this sale, that superior breeding cattle are still in demand, notwithstanding the great number brought into the country. We are informed that there will probably be no importations this season from England. A proper use of what we have, will make a vast change on the herds of the U. States. Nothing is wanting to render the cattle of the United States equal to those of any region of the world, but an observance of the rules of breeding and rearing cattle, deduced from the long experience of other countries. We have luxuriant pastures, abundant grain, and a kind climate. What else do we lack but prudence and skill in their use?

The following are the names of the purchasers, cat- tle, and the prices:

- Victoria, purchased by R. Fisher, \$1,750
- Prince Albert, her calf—J. Flournoy, 350
- Miss Hopper—Thos. Calmes, 270
- Washington—Dr. W. H. Richardson, 85
- Carcass—B. Gratz, 725
- Eolus—R. Fisher, 610
- Eclipse—R. Fisher, 1,050
- Elizabeth—A. McClure, 505
- Maria, calf of Elizabeth—J. R. Ford, 310
- Miss Luck—H. Clay, Jr. of Bourbon, 800
- Nelson, calf of Miss Luck—P. Todhunter, 610
- Fashion—G. W. Williams, 410
- Zela, calf of Fashion—G. W. Williams, 445
- Splendor—B. Gratz, 650
- Tulip—A. McClure, 700
- Brittania and calf Dido—H. Duncan, 375
- Isabella—R. Fisher, 355
- Lady Eliza—H. Clay, Jr. of Bourbon, 660
- Orlando, calf of L. Eliza, H. Clay, jr. of Bourbon, 305
- Lilly—T. Calmes, 390
- Trajan, calf of Lilly—Wheeland & Co. 150
- Nancy—C. J. Rogers, 739
- Avarida—John Allen, 929
- Buce, calf of Avarida—M. Williams, 315
- Beauty—H. Clay of Fayette, 700
- Flora, calf of Beauty—J. Thorn, 410
- Miss Maynard—A. McClure, 1,005
- Milton, calf of Miss M.—Jas. Gaines, 285
- Jessie—Joel Higgins, 330
- Rosabella—Wm. Warner, 465
- Crofton—J. Downing, 155

Improved Variety of Wheat.

Ahiel D. Gage, of Macedon, Wayne co. has this year raised several acres of a variety of wheat, which we consider greatly superior to most of our cultivated sorts. A few grains were originally found among a quantity of white flint wheat, and from these the present kind was derived. The discoverer has given to it the name of Siberian Flint Wheat, but we should much prefer that an American, instead of a foreign name, be given to it, and would therefore propose that it be called the *Macedon Flint Wheat*. It ripens sev- eral days earlier, is more productive, and much less lia- ble to lodge, than the common white flint. A field, sown with the two kinds, which had similar advant- ages in every respect, yielded last year, on that part sown by the new, thirty bushels to the acre; while the common flint yielded only twenty-one bushels. Similar results appeared this year. It is intended to deposit a specimen in the Rochester Seed Store. *

Masshannocks, vs. Robans.

Mr. Phineas Briggs of Albion, Orleans co. informa us that he is cultivating an acre of Masshannock or Mercer potatoes, which he challenges any grower of Robans to excel in quantity of produce this fall.

What say you, friend Harmon and others? Can't you beat 'em? We will bet two to one on Robans!

Labor Saving Machines.

We have recently seen a field of six acres of corn planted in two thirds of a day, with perfect exactness, by a machine drawn by a pair of mules driven by a boy, and the machine held by a man; and at the same time by the same machine the same field was mowed by twenty-five bushels of poudrette, evenly dropped in the drill. The calculation was to make the drills four feet apart, and to plant the corn eighteen inches in the drill, three kernels in a hill, with the intention of removing one, and leaving two to be matured. The machine was adapted to the ploughing and sowing every other variety of seed, even to the smallest, and with like exactness. The machine worked well, though we think it might have been made less cumbersome than it was; but it was not our intention at this time to describe it or compare it with others. The boy, if the mules had been well broken, might have been dispensed with, and the whole performed by one man; and this, upon the old system of planting, furrowing, tilling and manuring, would have been equal to the labor of eight men. The machine could be built for ten dollars cost. Now what an immense saving of labor has been effected by this arrangement! Yet men will tell us, with as much braggadocio and self-complacency as their waistcoats will contain without bursting the buttons off, that they want none of these *new-fangled notions*; they chose to go on in the *old-fashioned way*, as though the old-fashioned way was of course always to be the best way. Now the old-fashioned way was to wear undressed goat skins, sowed together with strings of birch bark, or pinned with thorns; to set on the bare ground; to bake your dough in the ashes; to dip up your porridge in a wooden bowl or a broken gourd, and eat it with a clam-shell. Why cannot we go back to these blessed times of our grandfathers, who were no doubt so much happier and so much wiser, and so much better than we are.—Alas! for the sad degeneracy of modern times; and the unhappy discovery, no (doubt the effect of some diabolical agency,) of balancing a meal bag upon a horse's back, without putting the meal in one end and a stone in the other.—*N. E. Farmer.*

Lime Burning--Perpetual Kilns.

Professor Ducentell, the state geologist of Maryland, in his report to the Executive for 1838, devotes a chapter to the subject of lime, its properties, mode of burning, and exhibits several diagrams of kilns, all of which are of interest. But the professor did not know, at that time, probably, of the improved process by which stone and shells were converted into lime, through the agency of wood and anthracite coal, by perpetual kilns, or kilns kept incessantly in operation as was the case at Bristol, Pa., and now in the manner shown by those at Spring Garden, in the suburbs of this city, under the superintendance of Messrs. F. J. Cooper & Co.

The kilns at Spring Garden, near the Southern termination of East street, will well repay the curious in such matters for a visit. They consist of three in number, of brick or stone masonry, and in form represent somewhat an egg, with a portion of the larger end taken off, and poised upon the smaller, the segment about 22 inches diameter, cut off. The kilns are charged—first with a portion of fuel, subsequently with stone or shells, and thus with alternate layers of fuel, or lime material—the shells and stone occupying different kilns—until they are filled; the fire is then communicated below; where, by the draft, the fire soon ignites, and as the shells or stones are sufficiently burnt, are drawn off through the aperture, and when cooled, placed under cover, and as the contents of the kiln continues to settle at top, new materials are introduced in the succession first noticed. In this manner 100 bushels are drawn from each kiln per day; and when the works are complete, 250,000 bushels will be annually burnt; and as the facility for putting it on board vessels is very convenient, a wharf extending along in front of the kilns, farmers and others can avail themselves of the circumstance, either when they bring wood or shells to take away the lime. In reference to the use of lime for agricultural purposes, we are silent, as our farmers are better versed in matters of that kind than we are.—*Lloyd's Com. Journal.*

METHOD OF RESTORING LIFE TO THE APPARENTLY DROWNED.—Recommended by the Royal Humane Society of England, instituted in the year 1774.—Avoid all rough usages. Do not hold up the body by the feet, nor roll it on casks or barrels, or rub it with salt or spirits, or apply tobacco. Lose not a moment in carrying the body to the nearest house, with the head and shoulders raised. Place it in a warm room if the weather is cold. Preserve silence, and posi-

tively admit no more than three intelligent persons. Let the body be instantly stripped, dried, and wrapped in hot blankets, which are to be frequently renewed. Keep the mouth, nostrils and throat free and clean. Apply warm substances to the back, spine, pit of the stomach, navel, and soles of the feet. Rub the body with heated flannels, or cotton, or warm hands. Attempt to restore breathing by gently blowing with a bellows, into one nostril, closing the mouth and the other nostril. Press down the breast carefully with both hands, and then let it rise again, and thus imitate natural breathing. Keep up the application of heat—continue the rubbing—*increase it when life appears*, and then give a tea-spoonful of warm water, or very weak brandy and water, or wine and water. Persist for six hours. Send quickly for medical assistance.

From the Farmer's Cabinet.

Fruit Trees.

MR. EDITOR—The following extracts from a foreign work will show the young people of our country how they keep up a succession of fruit trees in Germany, and perhaps it may stimulate some of them to imitate so laudable an example.

"In the duchy of Gotha, in Germany, there are many villages which obtain a rent of many hundred dollars a year for their fruit trees, which are planted on the road-side, and on the commons. Every *new-married couple* is bound to plant two young fruit trees. The rent arising from the trees thus planted is applied to the uses of the parish or town.

In order to preserve the plantation from injury or depredation, the inhabitants of the parish are all made answerable; each of whom is thus on the watch over the other; and if any one is caught in the act of committing any injury, all the damages done in the same year, the authors of which cannot be discovered, is attributed to him, and he is compelled to atone for it according to its extent, either by fine or corporeal punishment."

"A gentleman at Colchester, England, makes it a rule, whenever he builds a cottage, to plant a vine against its walls, and two or three apple trees near to it, or in the garden, and thus he confers a greater benefit on his tenant, by giving him an innocent source of gratification to his children, and an excitement to a little extra industry on his own part, than if he had let him a comfortable, mean-looking hovel, at half the rent."

A few ornamental trees and shrubs, disposed with good taste about a farm-house, add much to the beauty and pleasantness of the scene; and they never fail to make a favorable impression, on the mind of a visitor, of the character of the inmates of the mansion. A season should never be suffered to pass by without some addition being made, by the young people, to the ornaments of the yard, garden, or lane leading to the house. Some families have displayed their industry, taste and good judgment, in this respect, so conspicuously as to command the admiration of their neighborhood, and to excite the curiosity of travelers to inquire "who lives there?" Z.

From the Farmer's Cabinet.

The Treatment of Sick Animals.

There are so many erroneous notions prevalent in the community, respecting injured or diseased domestic animals, and such unnatural and injurious practices as a consequence of these incorrect views, that no apology is necessary for an attempt to subvert the cause and interests of these useful creatures, who if they had tongues to speak, would tell sad tales of the wrongs to which they have been, and still are, too often subjected.

We do not propose to give an essay on the particular cases that require attention—our object is rather, very briefly to ask the owners of domestic animals to be guided by a few correct principles, which are applicable to nearly all cases, and which will at least prevent our doing harm, where we are not able to effect much good.

In the first place, then, we would insist, that when an animal is well he never requires any medicine—and when he is sick, we would protest against his being dosed with articles that are said to be "good" for a particular disease, without any reference to its violence or the symptoms, as common sense would dictate: that remedies the most opposite in their character and effects, may be equally advantageous in different periods of a case.

Always distrust the man and the remedy, when your friend declares that an article is always "good" or a "certain cure" for a disease, without reference to

its symptoms—prescribing for the name of the disease, rather than the disease itself—this is the essence of quackery, in man or beast.

A large proportion of the diseases of animals closely resemble those of the human family, and require treatment conducted upon the same general principle—with some variations and some peculiarities, it is true, but none of those outrageous departures from common sense, which are too frequently witnessed.

A horse with pleurisy, or inflammation of the lung or apoplexy, requires a widely different treatment from one with colic or with worms. There is more mystery about the diseases of a horse or an ox than about those of a man, and a violation of natural laws is as productive of pain and injury in one as in the other.

There is too great a propensity, everywhere, to resort to active treatment in all cases—a feeling that is encouraged by the ignorant or designing for selfish purposes. An adviser in sickness is often most useful, and shows most skill where he only tells what to be avoided, and waits for indications for more active measures—doing little more than preventing ignorant but well meaning persons from interfering with the salutary changes that may be going on.

Remember, that there is a restorative power in nature, to which it is always better to trust, than to direct active remedies without knowing for what particular purpose they are given.

There is never occasion for the administration of the disgusting combinations which the poor animal made to swallow, from the mere whim of an ignorant horse or cow doctor. Many a fine beast has been lost by his owner trusting to such preparations.

When your animal has fever, nature would dictate that all stimulating articles of diet or medicine should be avoided. Bleeding may be necessary to reduce the force of the circulation—purging, to remove irritating substances from the bowels—moist, light, and easily-digested food, that his weakened digestion may not be oppressed—cool drinks, to allay his thirst, and to some extent, compensate for diminished secretion—rest and quiet, to prevent undue excitement in the system, and so on through the whole catalogue of diseases—but nothing to be done without a reason. Carry out this principle, and you will probably do much good—hardly great harm—go on any other, and you measure are more likely to be productive of injury than benefit. But, as we have before said, our object now is not to speak of diseases in detail—it is rather to encourage our agricultural friends to think before they act; to have a reason that will bear examination for every step in the management of a sick or injured animal; to remember they have a powerful assistant nature (if she is fairly used), and that specifics, they are called, are much fewer and less to be trusted than their proprietors would have us believe. We might, indeed almost sum up what we would desire in one general direction of five words:—TREAT YOUR BRUTES LIKE MEN. T.

July 7th, 1840.

Silk Culture.

A FEW FACTS RELATIVE TO THE SILK CULTURE.

It has been long known that cocoons can be obtained in any part of the United States, whenever moderate attention is bestowed upon the feeding of silkworms. But this is only one of the primary stages of the silk culture; and without the ability to convert the cocoons in a raw or reeled silk, they would not be a saleable commodity, since they cannot be advantageously exported or conveyed to greater distance. The question still remained to be solved—in our part of the country, at least—have we the capacity to weave the silk from the cocoons that may be raised, in a condition fit for a domestic or foreign market? Lectures, essays, and even books, have been published, to prove that the reeling of silk is an art so difficult, as to require the practice of at least two or three years, or even of five or six years. Such essays have, however been followed this season with similar results to the written, to prove the impracticability of navigating the Atlantic with steamboats, as the following facts obtained at a recent visit to the Model Filature in this city will plainly show.

Elizabeth Williams began learning to reel silk the 9th of last month, (June.) July 15th, commenced at half past eight o'clock, and reeled her bushel cocoons by three o'clock in the afternoon, having had a recess from twelve to one o'clock. Obtained from the bushel twenty ounces and a half, and continued her work till six o'clock, P. M., reeled twenty-eight ounces in the day. The cocoons were of the sea-navy variety, and very good. The silk twenty-five fibrils.

On the 16th, the same girl reeled, from similar cocoons, and without any extraordinary exertion, the

bunds and one ounce of twenty-five fibre silk, between the hours of half past 7 A. M. and 6 P. M.

Hannah Hill commenced learning to reel May 27th, (of this year) and obtained from her bush of pen-nut cocoons, twenty-two ounces. In the course of the day she reeled altogether twenty-four ounces of twenty-five fibre silk.

Cornelia King began learning July 1st, and about fortnight afterwards, namely, on the 16th of July, of eighteen ounces of twenty-five fibre silk from one ashel of pen-nut cocoons.

In the silk filatures in Europe, from one to one pound and a half is considered the daily task of an experienced reeler.

Although the silk reeled after such limited experience will sell readily for \$5.50 to \$6 per pound, in its w state, we are ready to admit that the reellers here referred to have not yet attained perfection in the art. The facts thus furnished, however, show that the reeling of merchantable silk is so difficult as has been presented, why then must the success just stated owe the very superior capacity in the directness of the model filature to teach, and in her pupils to learn.

Two doors from this establishment in Market street, just above Eleventh, another filature has been commenced by private enterprise. This has six reels in operation, but as the cocoons raised this season are now coming in pretty fine, it will soon have at least a dozen reels at work. It is proper to observe that the Piedmontese reel is the only one to be seen in either of these promising establishments.

Philad. U. S. Gaz.

FRANKLIN.

The Durham Cow "Blossom."

Observing in the Pennsylvania Inquirer a short time since a statement of Mr. J. Gowen's celebrated *Dairy Maid's* yield of milk for one week which states "is unprecedented, being on an average rather over 33 1/2 quarts per day," I concluded to try my cow *Blossom*, a statement of whose milking for one week will find below, and by which you will perceive she averaged for the week over 35 qts. per day, and yielded 13 1/2 lbs. of well worked butter. Not having a spring house we are obliged to keep our milk in a pail, which at this season of the year every one acquainted with the process of butter making knows could be unfavorable for a large yield. My dairy aid is firm in the belief that at a cooler season, or in a spring house, the cream she had from *Blossom* the week would have yielded 15 or 16 lbs. of butter.

Uncommon as this produce may be, I do not consider it more so than the fact of her having never been dry since she had her first calf, more than two years ago and in the space of 25 months has produced five young calves, viz. on the 5th of April, 1838, she had her first calf (*Delaware*) on the 14th of July, 1839, she had twins (*Liberty and Independence*) and on the 16th of May, 1840, she had twins again (*Romeo and Juliet*.) and I think I can safely say that during the whole of that time she has averaged full 20 quarts a day with her first calf and made near 12 lbs. of butter per week.

As I consider it an injury both to the cow and calf milk up to calving, we tried both last year and this get her dry a few weeks before the time, but found it impossible although we kept her off of grass for me days.

As you may suppose, such constant milking keeps her very much reduced; she could be got dry for a time so as to gain flesh. I think her yield would be much greater, but am satisfied with it for the present, and until I see it beaten: when that is done I will try again, for the credit of little Delaware.

Blossom is a thorough bred short horn Durham, an color, calved in 1835, bred by Charles Henry Hill, Esq. of New York, (of whom I purchased her when two years old) she was got by *Ind's Regent*, from the imported cow *Leonora*, (a great milker) by a son of *Lancaster*. &c.

Very respectfully, SAMUEL CANBY.

Woodside, June 29th, 1840.

Blossom's yield of Milk for one week.

being on an average over 35 quarts per day.—*Delaware Journal*.

The following just remarks, prefixed to the article of our correspondent R. S. S. published in a previous number of this paper, are from the pen of the Editor of the American Farmer:

Hollow Horn.

In the same number of the New Genesee Farmer, we find some observations on the disease of cattle which we read with peculiar satisfaction; because it appears to be from the pen of a regularly bred physician; and to have been written purely from motives of benevolence and a desire to be useful. We have often maintained the importance of having in all our medical schools, a department in which comparative anatomy and the diseases of animals should be studied and taught. The young men who are educated there generally go into the country to establish themselves, and it often happens that their skill might be employed in saving the lives of valuable animals, some of them much more so than some of their bi-ped, bloated whiskey-drinking patients. The legislatures in granting charters to colleges and medical schools should make it incumbent on the corporation to maintain a professorship of this sort, and every farmer should make his son attend that course of lectures, whether it were his intention to make medicine a profession or not. For ourselves, when a favorite animal gets injured or sick, we call in at once the advice of our family physician, instead of relying on quacks and old women; we have never found them hesitate to take an honorable and lively interest in the case, as though it were a human being; and why should they not? A sick man can point you to the seat of pain and describe the symptoms of his disease—the poor speechless dog or horse must depend on your humanity, and often loses his life by false conjectures and remedies blindly administered—too often by their neglect. Last winter, the ground being covered with snow, we discovered on rising early in the morning spots and streams of blood about the barn yard and fields, and at last found a favorite saddle horse had gotten out of the stable, and had been kicked in the jaw. The heel of the shoe of another horse had cut the artery, and although by the conglutination of the blood on the outside, the hair being long, it would sometimes stop, it would soon break out again to bleed with more violence. We sent in haste for Dr. Thomas Franklin, who came with as much alacrity as it he had been called to a friend, bound up the wound, but distrustful of the sufficiency of the remedy and directed that should it break out again he might be sent for. After remaining so all that day, it broke out in the night—the Dr. was again sent for—it was found that no bandage would prevent the bleeding as soon as the horse began to masticate, and to save his life it was necessary to cast him and have the artery taken up. Here would a most valuable horse have been lost had it not been for the exercise of that knowledge of anatomy and surgery which ought to be taught to farmers' sons in all incorporated schools. Let us add the fact, that this faithful horse appeared to be aware that he was bleeding to death, for he was traced in his course, first to the dwelling house, where, finding no success, he traveled across a corn-field, over the snow, to the only quarter there was on the plantation, to the distance of nearly a mile, for which he could have had no motive or inducement, but to expose his danger and seek relief. But to the case in the Genesee Farmer described by R. S. S. who we take to be a Right Skilful Surgeon—here it is—it may be used in cases of hollow horn, which in some parts of the country is said to be caused by hollow belly. Yet there will be one difficulty in administering the remedy he suggests—Reader, would you know what that is?—Not one farmer in twenty has a phlebotomy to bleed with!

To make Wives Love their Homes.

A great deal has been said, here and elsewhere, about the stay at home duty of wives: and the obligation under which they live, to make home pleasant and comfortable, attractive and all that. The inference from this one sided preaching and caution is, that men have nothing to do in the matter; and that nothing depends upon them in relation to the comforts of what is intended to be the pleasant place upon earth.—Women are soundly rated for gadding, as if they had no right to be seen out of doors; while men may treat their houses as mere cook-shops, and places where lodgings are provided for them—coming in only to their food and to their beds, and no body questions either their right thus to neglect their families, or the propriety and policy of such neglect.

When a man thus contemptuously treats his home, and evinces in every action his preference for any

place except his own fireside, what are we to expect of the rest of "the folks" but that they should emulate the father of the family, and despise home too? If they make it comfortable, it must be from selfish consideration; for nobody cares any thing about it more than an hour at a time. All the efforts of the wife to call attention to improvements and alterations in the household being lost, or, at most, responded to in the language and tone of indifference, she becomes discontented; and naturally learns to put a small estimate upon what receives but small consideration from others. Of course she must "gad" or be miserable.

Wives and religion are treated much alike in this world. *Bats*, to use an Hebraic simile, are conceded the one thing needful—and both are neglected. To both a great deal of lip worship is paid—and towards both, to do human nature justice, there is a great deal of warmth of heart. It is however but a cold sanctified feeling—a sentiment by fits and starts, which comes over one when he is melted by adversity, or cheered by extraordinary good fortune. It comes out upon great occasions, but in the daily walks of life, where its influence should be seen and felt, it is a hidden thing. If a man is dying himself, he calls upon his Maker with as much fervency as if he had never forgotten Him; and if his wife is at the point of death, he makes himself as busy and anxious as if he had never forgotten her. The same feeling, equalized through his life, would prevent a man's terrible anxiety at the hour of death; and proper and attentive care of his wife, at all times, and under all circumstances, would leave him no necessity to be over anxious to atone for usual carelessness when she is in danger or distress.

Every married man who does not know that his wife's whole soul is in her home, ought to learn it.—If such be neither disposition he will stand a fair chance to be unhappy, unless, indeed, he can find some means to alter her tastes, or to conform his household and his pursuits to her peculiar mental conformation.—Waiving such as extraordinary cases, and taking women as we usually find them, the married man should consider his house as his wife's empire; and if he would obtain and keep a hold upon her sincere affections, he must learn to feel an interest in all she does within her proper sphere. The veriest trifle that takes place at home by her direction, is conducted with a view to his comfort and wishes. Men do not think of this sufficiently. Their cares and intercourse are divided on so many different points and among so many different people, that they cannot, without schooling their minds to the subject, comprehend a woman's single attachment to one person, and care for him. He cannot realize that it is his duty to meet this by a corresponding feeling, to be shown always at home. Engrossed in the weighty cares of business, he forgets that what appear but trifles to him, employ as much the attention of his wife, as his negotiations upon "change, or his business transactions or affairs occupy him. He would feel sadly annoyed, if what he chooses to tell his wife of his business, did not interest her, or if she made no inquiries relative to his business and prospects.

On the same ground, he should reflect that his wife has a right to be nettled and vexed, and may naturally become habitually dependant, if he passes the budget of domestic news without the expression of any interest. He ought to see the whole advantages of any removal of the furniture, any change of the carpet, or indeed any movement within doors which she may have resolved upon in her cabinet councils. He may even assume a right to a voice in these discussions, and she will like it all the better, if he do not attempt to often the exercise of the veto power. She is queen of the realm; he should be, in a manner, a Prince Albert—a sort of a subject consort; never disputing her authority, but making suggestions, as Prince Albert most certainly will. He may be sure that if he attempts to detraction, and merely expresses wishes, and acknowledges gratification, that the bare expression of interest in household matters will put him in the attitude of a "power behind the throne, greater than the throne itself."

This participation of the husband in affairs at home, will necessarily keep him more in the house. He will never find a chance to complain of his wife's gadding, because, having no inducement to seek sympathy and society abroad, she will become domestic from choice and habit. The participant in all her plans and pursuits, he will know better than to be in a pet at her trips abroad, because he will understand her motive and her reason for all such excursions. In a word, being a reasonable husband, he can but have a reasonable wife, for there are few, if any, faults of husband and wives, that are not mutual.—*N. Y. Dispatch*.

OBITUARY.

It has become our melancholy duty to record the death of one of the publishers of this paper, ELIHC F. MARSHALL. He died of consumption, on the morning of the 29th of August, after an illness of about three months, aged 46 years.

Mr. Marshall was a native of Easton, Washington county, N. Y. He came to this city fifteen years ago and was long well known here as a bookseller and publisher; and, as the author of "Marshall's Spelling Book," his name is familiar to thousands of youth in our land. He has twice held the responsible office of City Treasurer. Although a cripple from his youth, he was active, industrious, and enterprising; and few men received, or deserved a larger share of the esteem and kindly sympathies of this community than him. In his death we have not only lost a valuable assistant, but an esteemed friend. A wife and two young daughters have lost a fond husband and father, who was bound to them by the strongest ties of affection. As a citizen, a philanthropist, and a friend, his memory will be cherished, and his loss will long be felt by many in this community.

His funeral was attended from the Friend's Meeting House, at 10 o'clock, A. M. August 31st.

Dreadful News from Florida.

Death of Dr. Perrine, and destruction of Indian Key, by the Seminoles.

The Charleston Courier of August 20th, contains the painful intelligence of the destruction of the settlement of Indian Key on Cape Florida, and the butchery of part of the inhabitants by the savages. Among those who fell, was Dr. Henry Perrine, whose death is a great loss to science and to the nation. Dr. P. was formerly United States Consul at Campachy, and for several years past he has been assiduously engaged in the patriotic enterprise of forming an establishment at Cape Florida for the introduction and culture of Tropical plants, such as it was thought might prove of value in the southern parts of this country. With the aid of Congress a company was formed for this purpose. Dr. Perrine commenced a preparatory Nursery with a large collection of plants at Indian Key, where he intended to reside till the cessation of hostilities—but where he has fallen a victim to his zeal, by the hands of the merciless and exasperated Seminoles. It is said that he was shot, and afterwards consumed by fire in his own house. His wife and two children made their escape.

Fire and Loss of Life in Rochester.

The large building on Main-street, adjoining the bridge, known as Curtis' building, and occupied by several stores, wool carding and other machinery. Flouring mill, &c. was consumed by fire on the morning of the 26th of August. Loss estimated at \$37,000. Insurance only \$7,000. The most painful circumstance connected with this event is the death of two respectable young firemen, G. P. Benjamin and John Eaton, who were at work in the river, extinguishing the fire from the bridge, close by the burning building, when the wall fell, and killed them instantly. Their funeral was attended the following day by the whole Fire Department in uniform, and an immense concourse of citizens.

Another Shocking Calamity.

By the falling of the draw-bridge at Albany on the 22d of August, TWENTY-ONE persons were killed. Well may we dread this page of our paper in mourning! We hope we may never have to record another such a melancholy chapter.

CENSUS OF ROCHESTER, BUFFALO & UTICA.—The population of the city of Rochester according to the late census, is 20,129—in 1835 it was 15,661. The population of Buffalo is 18,356—in 1835 it was 10,019. The population of Utica is 12,674—in 1835 it was 10,019.

GREAT CATTLE SHOW AND FAIR AT ROCHESTER.

ON THE 7TH AND 8TH DAYS OF OCTOBER.

The Annual Exhibition and Fair of the Genesee Agricultural Society, (for Western New York,) will be held at Rochester, on Wednesday and Thursday, the 7th and 8th days of October. Premiums will be awarded for the best animals of farm stock, field crops, garden products, articles of domestic arts, agricultural implements, &c. A ploughing match will take place, and an address will be delivered. The second day is intended chiefly for the sale of farm stock, of which it is expected a fine collection will be exhibited and large sales made. Many cattle breeders and amateurs from a distance are expected, and every farmer who wishes to buy or sell, or who loves to see fine animals, will of course be present.

The Annual Fair of the Mechanics' Association for Western New York, occurs at the same time—commencing on the 6th and lasts three days—and the many thousands of persons who witnessed their Fair last year, need not to be informed that the combined and increased attractions of this year, will draw together an immense number of spectators, and cannot fail to exert a powerful influence for the promotion of Agricultural and mechanical improvement. Every farmer who desires the advancement of the best interests of the country, should contribute his dollar and have his name enrolled as a member of the "Genesee Agricultural Society, for the promotion of Agriculture, Horticulture, and the Domestic Arts, in Western New York."

For the list of premiums and other particulars, see the "New Genesee Farmer" for August and September.

By order of the Executive Committee.

M. B. BATEHAM,

Corresponding Secretary.

* * * Publishers of newspapers in Western New York and Upper Canada, will aid the cause of improvement by inserting the above.

Mistakes of the Printer.—Our printer and proof reader being pardon of D. T. for several errors which escaped their notice in his valuable contributions last month. They are well aware that to a person like him, who takes pains to select his thoughts, arrange his words, and point his sentences correctly, it is very mortifying to have his writings carelessly printed; especially as they are frequently copied into other journals and sent all over the United States before there is any chance to correct them. More pains will be taken here after to avoid complaints of this nature; in the mean time our readers will please make the following corrections in our last number.

- Page 117, col. 3, line 2 from bottom, for "dry" read soak.
" 121 " 1, for "flammulus" read flammula.
" 121 " 2, for "stenctus" read stenactis.
" 121 " 3, line 16, for "in odour" read in our border.
" 121 " 3, " 20, from the bottom, the words "In England" should begin a new paragraph.
Page 125, col. 1, line 23, for "absorbed" read absorbent.
" 25, for "observed" read observed.
" 3, for "sots" read soil.

MOUNT HOPE GARDEN & NURSERIES, ROCHESTER, NEW YORK.

East side of St. Paul-street, nearly opposite Mount Hope.

THE subscribers offer for sale a fine collection of Fruit and Ornamental Trees, Flowering Shrubs, Green House and Hardy Herbaceous Plants, Bulbous Flower Roots, Double Dahlias, &c. &c. Orders sent per mail or otherwise will be promptly attended to, and all articles will be packed so that they can be transported safely to any part of the country. Gardens laid out and skilful gardeners furnished at short notice. Persons wishing assortments of any of the above articles to sell again will be supplied on very reasonable terms.

They would also inform the public that they are now removing their establishment from Buffalo and Sophia streets to the Garden as above, where they have new and more extensive Green Houses almost completed.

This establishment is intended to supply the Western States and Canada, with all articles in the line of Horticulture, and to prevent that delay and disappointment which almost invariably occur in obtaining them from the east; and on a short time, as soon as Trees, Plants, &c., can be arranged, a regular Botanical and Pomological Garden will be formed of which due notice will be given to the public so that they may visit and inspect it.

Prices in all cases will be as moderate as at any other establishments in the country, and no fruit of inferior or doubtful quality will be cultivated. M. B. BATEHAM & BARRY. Rochester, N. Y. Sept. 1, 1840.

Timothy Seed Wanted.

At the Rochester Seed Store. Also, Millet and Hoop seed. Sept. 1st, 1840.

Save your Plum Stones.

CASH will be paid for a few bushels of Plum Stones, delivered soon at the Rochester Seed Store. Sept. 1st, 1840.

TUSCANY SEED WHEAT.

C. W. T. CUYLER of Moscow has left for sale at the Rochester Seed Store, a quantity of his Tuscany wheat mentioned in No. 7, page 98, of this paper. This wheat is earlier and more productive than any common variety, and the berry is very large and fine. All who wish to obtain a superior article should call and examine this—it will speak for itself. Price \$2 per bushel. Sept. 1. M. B. BATEHAM.

ENGLISH IMPORTED SEED WHEAT.

AS the Agricultural Fair will occur rather late for wheat sowing, the English wheat imported for the Society will be disposed of previously, to such farmers as feel disposed to try it. The price is 25 cents per quart, and the profits, if any, will be given to the funds of the Agricultural Society.

The following are the names of the kinds,—some of which are new varieties highly approved in England.

- Golden Drop, Red Burrell,
Eclipse, Pegglesham,
Whittington, Chetham or Sussex,
Bellevue Talavera, Downy or Rough Chaff.

M. B. BATEHAM.

Rochester, Sept. 1st, 1840.

PORTABLE THRASHING MACHINES.

CLOVER MACHINES AND HORSE POWERS.

WARRANTED to be thoroughly built and to work well: made by THOMAS D. BURRILL, Geneva, Ontario Co., N. Y.

These machines have all been warranted "to be thoroughly built, and to work well;" and they have fully sustained that warranty.

They have gone largely into use; more than four thousand are in operation; many of them have thrashed from ten to twenty thousand bushels each, without repairs. More than eight hundred new machines were sold during the last season; and on thorough trial, they have been recommended by those who use them "to be as complete, and to work as well as any in the world."

His new Combination Machine separates the grain from the straw in the process of thrashing, without any additional machinery; saves the labor of one hand in raking away the straw—much grain which is usually raked off with the straw—and is driven with less power than any other machine in use.

Geneva, June 27, 1840.

ROCHESTER PRICES CURRENT.

CORRECTED FOR

THE NEW GENESEE FARMER, SEPT. 1, 1840.

Table with 2 columns: Commodity and Price. Includes items like WHEAT, CORN, OATS, BARLEY, RYE, PEAS, BEANS, POTATOES, APPLES, CIDER, FLOUR, SALT, PORK, BEEF, EGGS, BUTTER, CHEESE, LARD, TALLOW, HIDES, SHEEP SKINS, WOOL, PEARL ASHES, POT, HAY, GRASS SEED, CLOVER, FLY, PLASTER.

Remarks.—The price of our great staple, Wheat, during the past month, has been somewhat above our quotations. Immense quantities have been sold at from 81 to 85 cents; but the late news from England, together with a rapid supply, has had a tendency, for the present, to check activity and depress prices. We will hazard the opinion, however, that if farmers generally will take the advice of our able correspondent C. they will obtain a higher price for their wheat than is offered at present.

THE NEW GENEESEE FARMER

AND GARDENER'S JOURNAL.

M. B. BATEHAM, } VOL. 1. ROCHESTER, OCTOBER, 1810. NO. 10. } JOHN J. THOMAS,
 C. F. CROSMAN, Proprietors. } M. B. BATEHAM, Editors.

PUBLISHED MONTHLY

IN CONNECTION WITH THE ROCHESTER SEED STORE AND AGRICULTURAL REPOSITORY.

TERMS—FIFTY CENTS, per year, payable always in advance.

Post Masters, Agents, and others, sending money free of postage, will receive seven copies for \$3.—Twelve copies for \$5.—Twenty-five copies for \$10.

The postage of this paper is only one cent to any part within this state, and one and a half cent to any part of the United States.

CONTENTS OF THIS NUMBER.

Hot Air Furnaces, —by J. J. T., (with a cut) 145
 Hints for the Month. The Hannah Apple. The new Wheat. A Fact about a Cypress Vine. Domestic Conveniences—Cisterns. Aphides, or Plant Lice. Fruit Trees splitting down. 146
 Culture of the Hydrangea. Applying fresh manures. The Native Red Mulberry. Cure for Oxen's eyes. Killing Canada Thistles. Vegetable Diet. Flowers and Shrubs. Grape Jelly. 147
 The flowers of Summer. Transplanting Fruit Trees. Wisconsin, and its inducements for Emigrants. Important Experiments—soaking Seeds. The Durham Cow "Young Lily." Cultivation of Orchard Grass. On raising and cleaning Clover Seed—Clover Machines. Infiltration of Manures. Proofs of Infiltration. Clover Seed Culture, and Machines, (31 com.) 150
 Scotch Husbandry. A good Farmer. Measuring Corn. The Tomato. Paint your Pools. Foreign Sugars. For Farmers' Wives and Daughters. 151
 The Cattle Show and Fair at Rochester: List of premiums, and regulations for the Exhibition; Ploughing Match, &c. The Genesee county Fair; Ontario county do. 152
 Fair at Cleveland, O., Do. at Colborne, U. C. Lime as a manure. Cure for "Diseases in Poultry." 153

cents into the open air as in the common mode: five or six cords are found sufficient to keep the several rooms of a large house warm night and day through winter. 2. The saving of labor in cutting,—the wood being burned three feet long, and a foot in diameter if wished. 3. The saving of labor in making fires,—but one being needed for the whole house, and requiring to be replenished but once in six or eight hours. 4. The saving of labor in cleaning house,—the dirt of stoves and fire-places being wholly avoided. 5. The saving of house room, so largely consumed by other modes of heating. 6. The peculiar and comfortable warmth of summer, pervading the house night and day, so desirable in case of sickness or when it is necessary to rise in the night, and the diminished prevalence of colds and catarrhs found to result from the use of hot air.

The figure at the head of this article represents a section of the whole apparatus, and will give a correct idea of the plan, although the proportions may not be precisely correct. A, is the stove, which is 3 feet 4 inches long inside, 2 feet high, and 18 inches wide. It is made thus large, for the reception of large or knotty wood, thus saving cutting, and frequent renewing of the fuel. The bottom is a grate, made of cast iron bars, B, running lengthwise, through which the ashes fall into the ash-pit C. The air is admitted through the ash-pit door, which, as well as the stove-door, fits accurately, so that by closing or opening, the combustion may be completely controlled. Should any smoke escape from the joints of the stove, they should be closed by a paste made of iron turnings or filings with sal ammoniac and water.

From the stove the heat passes into the cast iron drums D, D, D, &c. eight of which are attached to it, and the smoke finally passes off through the pipe E. The drums are about 16 inches square, and 5 inches thick, and are cast with the short connecting pipes attached to their lower plates. They rest upon each other in such a manner that no fastenings are required to hold them together, and they are supported at bottom by brick, and on each other by the connecting pipes or necks, and by small cast iron stands. Their joints are securely closed by ashes. When they become filled with soot, they are easily taken apart and cleaned. By constantly breaking the current of smoke, they deprive it effectually of its heat, and it passes off greatly cooled into the open air.

Double brick walls, F, F, are built round the whole apparatus, thus forming a complete air chamber for the retention of the hot air, until it passes upwards through the hot-air pipes G, G, one of which should lead to each room to be heated. The inner wall may be made of bricks on edge, occasionally braced to the outer by a cross brick. An intermediate space of several inches, occupied by air, is thus left, and prevents the escape of heat from the air-chamber. Perhaps it would be still better if this space were filled with ashes. The top of the chamber is covered with brick laid flat and supported on wrought iron bars. Several inches of ashes are laid on the brick, and these again covered with another layer of brick, or a coat of mortar. Air holes should be made at the bottom of the brick walls for the admission of fresh air to the outside of the stove and drums. The air thus admitted should be perfectly fresh and pure, and if a room in the cellar, with an open window, cannot be thus appropriated, a trunk made of wood should proceed from the air outside to

the chamber. Two double-sheet-iron doors are to be hung on one side of the chamber, one opening inwards and the other outwards, large enough to admit a man to clean the drums, &c., and sufficient space should be left on one side of the cast-iron apparatus for his freely passing.

A saving in iron bars for supporting the top of the chamber may be made by first placing a few on edge, after the manner of joists, by which much smaller ones will be needed. Perhaps a still better way would be to make a square iron frame the size of the top, to which may be attached pieces of stiff hoop iron bent slightly in the form of an arch, for the support of the brick,—these pieces to be braced by one or two cross bars.

The smoke pipe E, should not be less than 10 or 12 inches in diameter, and the air pipes G, G, should not be less than 12 inches, and should be made of bright tin, to prevent the lateral escape of heat. By making the latter thus large, the hot air is thrown in large quantities into the rooms above, consequently the fire in the stove need not be so hot, and the air has none of the peculiar burnt odor of common stoves. Less fuel is also thus required, and the cast iron does not burn out so soon.

The upper ends of the hot-air pipes terminate at the floors of the rooms to be warmed, where a circular cast iron grate or ventilator is placed, which by opening or closing, regulates the heat of the room.

The pipes should be placed as nearly vertical as practicable, and when it is necessary to change their direction, it should be done by curves and not by elbows. The heat will not pass through them horizontally, unless there is a large portion of perpendicular pipe connected with them. Where it is necessary to carry the heat to a room not directly over the furnace, it should be done by a straight, inclined pipe.

As much more heat is thrown off while the smoke is descending through the first column of drums, than while ascending through the last, it has been very justly suggested to separate these two columns, or rather to form two separate compartments in the upper part of the chamber, by placing a plate of bright tin or bright sheet-iron across it, between these two columns, the air from each to be carried off by separate pipes.

The length of the whole cast iron apparatus, when set up, is about 6 feet 6 inches, the width 23 inches, and the height of the top of the upper drum, about 4 feet. Allowing two feet for the passage of the man for cleaning, on one side, and one foot space above, which is quite sufficient, and it will be perceived that the size of the air-chamber inside, is,—length 7 feet, width 4 feet, and height 5 feet.

It is probable that the use of hot-air will be found useful and very cheap for the warming of green houses, attached to dwellings; at all events, green house plants, and all tender roots, may be kept in rooms thus warmed, throughout winter, at no expense whatever. And we would ask those, who object to the loss of their favorite "blazing hearth," if habit, which created their desire for it, would not soon render a fine stand of beautiful flowers in the midst of winter, far more pleasing than a column of smoke, and a heap of burning sticks, and ashes.

Complete castings of the above described apparatus are furnished immediately to order, by Elbridge Williams of Palmyra, at five cents per pound, and if completely fitted and ironed, at an additional charge of ten dollars, the whole in the latter case amounting to from sixty-eight to seventy dollars. The remainder of the work will probably extend the cost to not far from one hundred dollars, one half of which is by many annually expended in fuel, above what would be needed for the use of such a furnace.

Hot Air Furnaces,

Numerous inquiries having been made of us, relative to hot-air furnaces, we believe we shall not render a more acceptable service to many of our readers than to furnish the following description. The plan is greatly improved on the one published last spring in the Calculator, and patterns of the entire castings having been recently made, the difficulty heretofore experienced in securing them is removed. A brief statement of the leading principle and advantages may be interesting to those unacquainted with them. The furnace is always placed in the cellar, or a situation below the rooms to be heated, which are warmed by the hot air thrown up through pipes from the furnace below. One fire thus warms the whole house. The principal advantages of this method are, The saving of fuel,—the furnace being so constructed as to retain nearly all the heat of the burning wood, instead of sending off from two-thirds to nine-

Hints for the Month.

During this month, the farmer commences sowing his crops—It is to be done in season, and well performed, that a part be not lost by haste and lateness.

But care is here necessary. Potatoes are sometimes dug early, well secured, and thickly covered with two alternating coats of straw and earth, as they should be when preserved on open ground; but still a large part are lost. This is owing to a want of ventilation in autumn. Potatoes, buried early, should be protected from the effects of the warm, damp and confined air, by means of a hole in the top of the heap, made by thrusting in a stick. On the approach of severe frosts this is to be stopped.

Potatoes kept in cellars, are well preserved as follows:—Provide necessary bins, cover the whole bottom with sand, line the sides with smooth neatly cut sods, fill them with the potatoes, and cover the whole with benten sods. For immediate use, they may be kept in barrels.

Mangel wurtzel should be harvested by the end of the month, or they may be greatly injured if not wholly destroyed by frost.

Ruta bogas should not be left later than the beginning of next month, for the same reason. By far the most convenient instrument we know of, was described by Erasmus Skinner, of Steuben county, in the Cultivator. It consists of a combined instrument,—a small, very sharp hoe on one side, for cutting off the tops, which is done at a blow while the roots are in the ground,—and a double pronged hook on the other side, for pulling the roots from the ground.

The same care, relative to ventilation, is needed for this crop, as for potatoes, with the additional precaution of continuing it through winter.

Apples, being abundant this season, should be all carefully collected and preserved for the winter feeding of domestic animals, when not needed for other uses.

Hogs should be fed with great regularity, the feeding places kept clean, and the pens well littered. By neglecting these, twice the amount of food may be given, and produce less effect.

Cattle and other animals, intended to be fed on roots through winter, should be gradually inured to them, as some require time to induce them to eat freely, and sudden changes sometimes lead to mischief.

Animals, whether kept in the stable or otherwise, should have plenty of straw as litter, not only to contribute to their comfort and good condition, but for the free production of manure. Let a full supply of straw for this purpose be therefore provided in season.

Timely care should be taken that straw for the winter feeding of cattle, be well preserved. A good contrivance for this purpose is as follows:—Set four strong posts in the form of a square, and somewhat inclining towards each other; to the tops of these posts, fasten four strong rails, thus forming a square frame, supported by the posts. Next, place rails, at a distance of about a foot from each other, inclining upon the inside of this frame, their lower ends resting upon the ground, and the upper spreading outwards, and forming thus a large rack, for the reception of the straw, which is built as a sack within it. As the straw is eaten away, the mass above descends and supplies its place.

Hay-racks for horses, are better if made vertical, than inclining outwards, the ascending breath of the animal not so soon injuring the hay, and the hay seed not filling its mane. One of the best modes of construction is to place the rack vertically at a proper distance from the wall, and another rack (or grate) at right angles to the lowest edge, through which the hay-seed falls into a box or trough underneath, and is removed when necessary.

Let the farmer prepare to accomplish as much ploughing before winter as practicable, for early spring crops.

And lastly, let none forget to plant ornamental trees and shrubs about his house, and at other suitable places, and he will not only render his home exceedingly more pleasant, but he will be doing the part of a true patriot, by increasing the attractions, the health, and the consequent value of his country. Now is the time, and a few days will accomplish wonders.

The Hannah Apple.

This new and excellent variety deserves notice.—The following is a brief description:—

Stem about one-third of an inch in length, inserted in a deep hollow; *fruit* flattish, somewhat conical, and sometimes slightly pentagonal, of medium size, yellow, covered with rich streaks of bright red; *calyx* closed, and inserted in a regular shallow depression. *Flesh* yellowish white, tender and breaking, of an exceedingly agreeable sub-acid aromatic flavor. It ripens about the middle of the ninth month, (Sept.,) and continues for a month. Several amateurs have pronounced it fully equal to any apple of its season.

It originated on the grounds of Asa B. Smith, of Macedon, Wayne county, N. Y.

The New Wheat.

The new variety of wheat mentioned in our last number as having been cultivated by A. D. Gage, of Macedon, we have since been informed, was originally discovered by *Jonathan Soule*, of Perrinton, some years since, and it is therefore proposed to give it the name of its discoverer. We hope we shall give our readers the right name at last.

We have also ascertained further particulars of its extraordinary productiveness. Our next neighbor, who had several acres, had an *averaged crop exceeding thirty five bushels to the acre*, although his white flint wheat, with equal advantages, yielded only about *twenty*; and among a number of other fields, some sown late and after corn, *none fell below thirty bushels to the acre*. We believe all these experiments were performed on a gravelly or sandy loam, never subject to baking, nor heaving by frost.

A Fact.

Accidents sometimes lead to important results. A *cypress vine* was planted on sandy loam, fertile for common crops, but grew only an inch or two, and continued stationary for several weeks. A quantity of soap suds was then thrown upon it, and it immediately commenced a vigorous growth, and advanced farther in twenty-four hours than it had done in weeks before.

Domestic Conveniences—Cisterns.

Every farmer should give particular attention to convenience of his household department. Female labor may be lessened to a surprising degree by studying this part of domestic economy. To contribute our mite, we here briefly give an account of the construction of a rain-water cistern of our own.

The pit for the cistern was dug so that the outside of the cellar wall formed a part of one side. The wall was built of cobble stone in common lime mortar, one foot in thickness. The bottom, which was laid on, was first covered with cobble stones, of uniform size, laid in water-lime mortar; a coat of the same mortar was laid upon this; and a second coat of smaller stones completed the bottom. The whole inside then received two coats of water lime mortar. By applying these to the walls before they had become dry, and then drying very gradually, they were wholly free from cracks. After remaining a few weeks, protected by boards from the sun,—the upper edge of the wall

was covered with a layer of water-lime mortar; two inch white oak planks covering the whole, (except a small curb, for the entrance of water and cleaning the cistern.) was laid on this mortar; a coat of water-lime mortar was then spread upon the plank; thick white oak slabs were laid again on this coat of mortar; another coat of mortar upon the slabs, and several inches of compact earth, forming with the planks and slabs, a little more than a foot in thickness, completed the covering. This is sufficient to prevent the water from freezing in the coldest weather, through the curb, (18 in. by 2 ft.) is left open. It also prevents all access of surface water.

The cistern adjoins the kitchen, and a lead pipe, one inch in diameter, passes from near the bottom, through the cellar wall, obliquely upwards, to the kitchen floor, where it is attached to the lower end of a small and good pump. Thus, plenty of rain water is at all times at perfect command. The cistern is between 6 and 7 feet in diameter, about five feet deep and holds about 40 barrels. Care should be taken to procure good water lime, failure often arising from bad material.

Aphides or Plant Lice.

A few weeks ago, a number of young cherry trees in the nursery, became infested with plant lice; and though we destroyed thousands by passing them between the thumb and fore-finger, they continued to extend along the rows. We found ourselves in serious difficulty. It was no small job to repeat our visits to so many trees; besides, their vigor was checked, and some, in consequence of this drain of their juices, entirely ceased to grow. Assistance however, came at length from an unexpected quarter. A worm? which at first we suspected of feeding on the leaf, was observed to devour them; but not less efficient was the *Coccinella* or Lady-Bug; and between them not a single aphid is now to be found on those trees which abounded with them so lately. The lady-bug keeps possession yet, taking shelter under the leaves which the lice had caused to curl.

We wish all our readers to become acquainted with these useful and beautiful insects. The shape of the *Coccinella* is nearly hemispheric, the upper part convex and the lower flat. More than twenty years ago, nearly two hundred species were distinguished. Some have red or yellow shells with *black* dots; others red shells with *yellow* dots; a third kind have red or yellow shells spotted with *white*; and a fourth have yellow shells spotted with *red*. Nicholson says, "*They all feed, both in their larva and complete state, on the aphides or plant lice; and are very voracious in purifying vegetables of the myriads with which they are often infested.*" Hereafter we shall take the liberty to colonize them when we have particular jobs for them to do; and on all occasions treat them as our friends.

With that worm? we hope to become better acquainted.

Fruit Trees Splitting Down.

For want of a little care when the trees were small, we have lately lost some large limbs of both peach and plum trees,—the weight of fruit combined with wet leaves and high winds, having split them down. Yet losses of this kind are easily prevented. Let the principal branches be diverged nearly at right angles with the main trunk, and nature will provide a sort of net-work of the hardest and firmest wood, to connect them together; but where the branches rise up almost parallel, as their diameters increase, the bark of each is pushed together, but it cannot coalesce; and in a few years one or both will fall, often to the destruction of the tree.

Let only one of all such upright branches therefore remain; and cut off the rest without any regret or hesitation, unless they should be so flexible as to be bent into the proper position, and kept there by tying. The loss of taking off such limbs from young vigorous trees however, is very small, as the nourishment which these appropriated, is turned into other parts of the tree.

Culture of the Hydrangea.

We have tried to make *Hydrangea hortensis*, a garden plant as its name implies, but without much success; and we are satisfied that in this climate it properly belongs to the Green House. It is true it will live in the open ground without protection, but it loses all its blossom-buds; and even with extraordinary care, when these are preserved, the bloom is inferior in beauty. It may be kept in the house with far less trouble.

This shrub should be treated as a native of the marshes with a peaty soil and a liberal supply of water in summer. London says that a large plant will consume ten or twelve gallons daily.

Its flowers are commonly of a pink or rose color; but it has been found that some soils change them to a fine blue. A yellow loam from Hempstead Heath in England, has this effect. Some have found that turf ashes, changed their color; and others have succeeded with alum water. Robert Baist of Philadelphia, in his Flower Garden Directory, however, recommends the iron sparks (finery cinder) from the blacksmith's anvil to be mixed with the soil in the proportion of three pints to the bushel. The flowers will then be "a beautiful blue."

Applying Fresh Manure.

Messrs. Editors—I am glad to see, in so high an authority as D. T., an advocate for fresh stable manure, in preference to that which is old and rotten. On a small scale I have so often witnessed the same results that attended his experiments, that I now use fresh stable manure for the garden in preference to that which has fermented. But from close observation, I am inclined to believe that the gain in the stronger fermentation of fresh manure, is only one half the advantage derived from it, particularly on heavy soils. The very act of decomposition in the manure lightens the soil, and lets in oxygen and carbonic acid from the atmosphere; then the successive burrowings or working of the cultivator, while it mixes the manure with the soil, aids the gasses in forming other combinations favorable to the proper absorption and distribution of heat and moisture. This last result is also brought about by judicious weeding after the plants are up.

I once asked a very practical gardener how he managed his manure to keep it from producing weeds.—He replied that weeds were no disadvantage to horticulture; that as fast as they attained an inch in height, the earth wanted a sufficient stirring to uproot and destroy them; that this stirring of the soil, rather than the removal of the weeds, forced the vegetable growth so fast, that most kinds of weeds died in its shade.

A propos of manures—I have manured one bed of sugar beets with bog dung, and another with fresh horse dung, the soil calcareous clay, ameliorated with lime and sand,—both beds received the same attention, the first suffered more or less from drought, but the roots grew tolerably well; the second bed held its moisture better, both roots and tops grew enormously, although planted close (12 inches apart each way) many of the beets weighed 9 lbs. each.

From the above result, I drew the conclusion that the lime in the soil did not affect the stable manure unfavorably; while with the more soluble bog manure, formed a compound which had less attraction for the

oxygen of the atmosphere, hence the suffering from lack of moisture in the first bed.

Mons. Paris says, "that late German chemists have discovered that lime soizes in the soil the soluble humic acid, takes it from all other bases, and forms a compound but slightly soluble." Hence it may be inferred that for root crops and Indian corn, lime should be used sparingly, perhaps not at all where the soil is calcareous. But the very fact that lime makes manure less soluble, may be an argument in favor of using it more liberally on wheat fallows; as wheat not only contains lime in its composition, but it feeds long and abundantly in a partly calcareous soil, and thrives not well when the soluble parts of manure are too grossly administered. SENNA.

The Native Red Mulberry.

Messrs. Editors—I enclose you two impressions of leaves from a Native Black or Red Mulberry tree growing on the farm of N. Cole, Esq. of this place. Are not these impressions larger than the average of the leaves of the *Morus multicaulis*, and are not the leaves of this Mulberry as valuable for feeding silk worms as those of the celebrated speculation variety?

Yours, &c. E. C. GREGG.

Corert, Seneca co. N. Y.

Remarks.—The impressions received with the above were, one 9 by 7 inches, and the other 8 by 6 inches; which may be called about the average size of the leaves of the *Morus multicaulis*. Silk worms have been fed on the native Mulberry (*Morus rubra*) with tolerable success; but it has been found by experiments that they will not produce as much, and as good silk as when fed on the leaves of the White Mulberry, or of the *Morus multicaulis*. Thus the quality of the leaves must be taken into the account, as well as the size and quantity.—Eds.

Cure for Oxen's Eyes.

Messrs. Editors—Six weeks ago an ox of mine received a hurt in one of his eyes; and in two days a white film grew over the eye so that he could not see out of it. I took new milk and bathed the eye, rubbing it gently for some time; then put a tea-spoonful of goose-oil into the opposite ear of the animal, repeating the operation for three successive days. In one week the eye was restored, perfectly clear as the other. This remedy will be found equally effectual on horses' eyes, and appears to me to be far preferable to the torturing method of blowing crude and harsh substances into this delicate organ, or of applying acrid and caustic washes; and if you think it worthy of a small corner in your valuable paper, you are at liberty to publish it. I hope hereafter to offer something more worthy of your notice.

Respectfully yours, W. L.

Haldimand, C. C., August, 1840.

P. S.—I received the package of the New Genesee Farmer, and am much pleased with it. I trust it will soon become better known, and more generally circulated in this Province, as well as on your side of Lake Ontario. I have lent some numbers to my neighbors, and will try and send you a good account of them.

W. L.

For the New Genesee Farmer.

Killing Canada Thistles.

Messrs. Editors—It will sometimes be found more convenient to kill Canada Thistles by the application of salt, than by the ordinary method of tearing them up with the plough. A small patch, especially if it be in pasture or meadow, may thus be destroyed without materially injuring the sod. The way is for a man to go over the ground with a hoe, carefully cutting off each plant just below the surface of the ground, and a boy to follow after and put a small dose of salt on the uncovered roots, say one to two tea-spoonfuls to a root,

until every plant has been supplied. It is quite probable that a month or two afterwards a few sickly looking yellow plants may appear, but if they do, another similar course of treatment will be effectual.

Any sharp hoe will answer for cutting them off, but experience will show that labor can be saved by a little different construction. The hoe should be narrow and a little heavier than common. For instance, something in the shape of a chopping axe, with the handle put in at right angles with one of the flat sides. It should not however, be as heavy as an axe. The required weight being merely that which is necessary to give force enough to the blow to sever the root without difficulty. Such a hoe will be found very convenient for cutting up docks, burdocks, &c. &c.

Canada Thistles should be cut up as soon as they are in flower, and as much sooner as is convenient. Hence the sooner it is done, the better. THISTLE.

Vegetable Diet.

There cannot be a doubt that the diet of the Irish is highly favorable to vivacity and talent. It is stated in the Code of Health, that "vegetable food" has a happy influence on the mind, and tends to preserve a delicacy of feeling, a liveliness of imagination, and an acuteness of judgment, seldom enjoyed by those who live principally upon animal food. The latter is better calculated for those who labor with the body; but the celebrated Franklin ascertained that a vegetable diet promoted clearness of ideas and quickness of thought, and that a transition from vegetable to animal food produces injurious effects. A friend states that he has more than once selected from his tenant's children, a boy remarkable for that sameness of intelligence so common in the Irish youth, while in the capacity of errand boys on the farm, or helpers in the stables, and before they became pampered with better food than their parents' cabin afforded. The lads were at first lively and intelligent, and displayed a degree of shrewdness exceeding what is generally met with from youths of a more exalted walk of life in England. But he invariably found that in proportion as these boys were better fed, they relaxed in activity, became dull and stupid; and he is confident the change in disposition sprung from the effect of change in diet, and was not owing to corruption of mind from their intercourse with the other servants. In fact they lose all that vivacity of manner so eminent in the Irish boys, whether born in the vast bog of Allen, or in the dry and rocky counties of Mayo and Galway. He is therefore inclined to think that the character of the people does not depend so much upon climate or soil, as upon food, for no part of the globe can differ more than these parts of that kingdom.

A potatoe diet is found greatly to improve the quality of the blood. Hence "roasted potatoes" have been successfully employed as a specific against the sea scurvy, when other remedies have failed. This discovery was made in France. It is singular that boiled potatoes do not seem to have the same good effect.—*Sir John Sinclair.*

Flowers and Shrubs.

Why does not every lady who can afford it—and who cannot—have a geranium or some other flower in her window? It is very cheap—its cheapness is next to nothing if you raise it from seed, or from a slip; and it is a beauty and a companion. It was the remark of Lough Hunt, that it sweetens the air, rejoices the eye, links you with nature and innocence, and is something to love. And if it cannot love you in return, it cannot hate you; it cannot utter even a hateful thing, even for your neglecting it; for though it is all beauty, it has no vanity; and, such being the case, and living, as it does, purely to do you good, and afford you pleasure, how will you be able to neglect it? We receive, in imagination, the scent of these good natured leaves, which allow you to carry off their perfume on your fingers; for good natured they are, in that respect above all other plants, and fitted for the hospitality of your room. The very feel of the leaf has a household warmth in it—something analogous to clothing and comfort.—*Boston Traveller.*

Grape Jelly.

We have examined a specimen of this exquisite article. It is made from the Isabella ripe grape, raised at Croton Vineyards; the object has been to preserve the flavor and virtues of the ripe fruit. In this the preparation has met with the most perfect success.—We recommend the jelly as delicious to the taste, and an excellent beverage to the sick.—*N. Y. Express.*

The Flowers of Summer and Autumn.

Many plants which adorn the garden in summer, continue their bloom into autumn. Of this class are most of the *annuals*, and all those flowers which are denominated *monthly*—i. e. not only blooming once a month for a few days but all the time, if not interrupted by drought; and even then resuming their beauty after refreshing showers.

Cleome grandiflora is a botanical curiosity. It belongs to the only genus in the Class Tetradyamia, which is excluded from the Natural Order Cruciferae. The petals are not cross-shaped, but ascending—or contained in the upper half of a circle of which the pistil is in the centre. It grows 4 or 5 feet high, and with its red-purple flowers makes a fine display at a distance. It has succeeded best with us, in a border partially shaded by a high fence from the sun.

Campanula Loucii and *C. pentagonia*, one purple and the other white, have bloomed throughout the summer, and continue their freshness.

Clarkia bicolor has generally white blossoms, but some are pink on the same stem; and we had one petal of this color while the others in the same flower were white.

Phacelia tanaetifolia has presented its pale blue flowers in abundance; and its vigor seems unabated.

Godetia is scarcely distinguishable from *Oenothera*. *G. rubicunda* is fine, but perhaps not so well suited to heavy soils.

Convolvulus tricolor is an old favorite, but continues unsurpassed in beauty. It has undergone some change of color however, and mixed with its fine blue, we find flowers of a lighter shade.

All the species of *Schizanthus* are delicate and beautiful. *S. Priestii* appears to be only a white variety, which may soon acquire its pristine colors.

Lupinus nanus has blue-purple flowers growing in whorls, but diversified in color by the whiteness of the corol before it expands.

Lazatera trimestris in its white and red varieties, and the richer and deeper and varied red of the *Malope* to which it is nearly allied, with the fine scarlet of the *Ziania*,—are beautiful ornaments of the border.

The *Chinese Mallo* has a delicate flower marked with red stripes, resembling some varieties of the *Polarionium*. The flowers appear to better advantage however, when some of the large leaves are removed.

The genus *Petunia* furnishes three fine species with eccentric stamens and pistils. *P. nyctaginiflora* has large white fragrant flowers on tubes two inches long; *P. purpurea* with smaller flowers of a red-purple on short tubes, and both are very showy, blooming through the day; but there is another sort which is night-blooming and also fragrant, the flowers standing on tubes nearly four inches in length. All these are well deserving of a place in the garden.

We have two other *annuals* of uncommon beauty in the Yellow Hawkweed (*Crepis (Tolpis) barbata*) and the Yellow Sultan (*Centaurea stuebeliana*.) These are old favorites, and will scarcely be eclipsed by any that are yet to come.

We shall now speak of *perennials*,—for *Maurandia Barclayana* though treated like an *annual*, may be transferred to the Green House, and bloom through succeeding years. Its dark blue-purple contrasts finely with the pink flowers of another variety?

Liatris scariosa varies in the size of its flowers, but our finest variety came from the plains of Circleville, near the Sciota river. By a little art it is rendered more beautiful. Shorten the stem to increase the number of its branches; "and then," says Elliott, "from the size and brilliant color of the flowers, it becomes the most ornamental species of the genus." It also appears to advantage when laid prostrate some time before it comes into bloom. It continues an or-

nement of autumn, while *L. spicata* and *L. flexuosa* fade at an earlier period.

Aronium japonicum from the East, and *A. uncinatum* from the woods of Virginia, present their blue-purple flowers in abundance; the latter growing luxuriantly in a shaded border of vegetable earth. The finest species that we have seen of this genus however, is *A. variegatum*—a glorious plant; but our soil seems unsuited to its health.

Dracopcephalum speciosum? is often despoiled of its flower-buds by the same insect that attacks the Dahlia; but when it blooms well, as it has this season, its appearance is fine, and reminds us of the ruffs worn in the days of Queen Elizabeth.

Colchicum autumnale, and *C. variegatum*, are very pretty, resembling the Crocus, except that the flowers come forth without the leaves. The former has passed into many varieties, chiefly single, but one at least is double. From a pale purple sort, we have seedlings with white flowers.

Hibiscus incanus from Illinois, is one of the latest that come into flower. These are large, white, or a slight bluish, with a fine red eye.

Bignonia grandiflora is not quite so hardy as *B. radicans* but it blooms in the open border, though, we think, not so well as it would in the reflected heat from a wall. This season it has sent out stems which have trailed on the ground and blossomed. We have nothing to eclipse it at the time it is in flower. †

Transplanting Fruit Trees.

Some people are quite discouraged from procuring the finer and rarer kinds of fruit trees—they can't get them to grow. We know of several instances where liberal purchases were made, considerable care extended, and high expectations entertained, which have ended in nothing but disappointment. Now when things happen so, somebody must bear the blame; and the poor nurseryman, not being present to take his own part, will be likely to receive a full share. This suggestion is not an idle conjecture. The case however, ought to be probed to the bottom, both on account of the seller and the buyer.

The great sin of the nurseryman is selling trees under wrong names—propagating the *spurious* instead of the *genuine*—receiving pay for one kind and delivering another. His next sin is in disposing of unhealthy trees. This rarely occurs however, except in districts where the *Yellows* in the peach tree is prevalent,—for the condition of almost every other sort, may be known at once by every man of common observation, when he goes to purchase. It is therefore evident that if the nurseryman delivers at the proper time and place, the *genuine* kinds in a *healthy* state, and well packed (if requested) he cannot equitably be accountable for any disasters that may follow.

We will now inquire whether the purchaser does his part, faithfully? If he goes with his team for the trees, and to save time, or the expense of packing, takes them at once from the nursery,—he ought to wet the roots, and keep them wet, by packing them with wet straw or hay, and covering them with blankets, all of which should receive a shower from the watering pot. To carry them through the dry air and warm sunshine, uncovered, causes the roots to wither; and many trees are lost by such severe and improper treatment.

He takes them home, however. It may be in the evening when he arrives, and a sharp frost follows. If the roots become frozen, he should be particular *not to let them thaw before they are planted*; but set them in the ground in bunches without delay, to remain for a day or two, till this danger is over. Even peach trees when frosted, which are more tender than some other kinds, may be successfully treated in this way.

Before the trees arrive however, the holes should be dug. Six feet in diameter, and eighteen inches deep, is a proper size;—the rich soil being laid round the circumference, and the harder and sterile subsoil thrown back, so as not to be in the way when the excavation is filled. Some leaves, rotten wood, corn stalks, or potato tops, may be mixed with the soil to keep it loose, as it is scraped into the hole; but to provide against the settling of this bed of earth, it should be raised several inches higher than the adjoining ground,—otherwise the tree in a few years would stand in a depression. Trees treated in this manner will not only be more likely to grow, but they will grow faster, and bear sooner, and always bear better fruit, especially in dry seasons.

This is not all that ought to be done however, to insure the life of the tree. The ground near it, should be thoroughly hoed, as often as once a month throughout the growing season; and we can safely say that we have never lost a tree in good condition that was set in mellow ground well cultivated. A farmer once bought several dollars worth of fruit trees at our nursery, and intended to treat them in the best manner. He dug good holes, put in rich earth, but all would not do,—most of the trees died, and the few that survived did no good. What could be the matter? We happened to meet his hired man a year or two after, and inquired, Were they carefully planted? Yes—all according to direction. Were they hoed round as often as once a month through the summer? No, they were not hoed at all.—That explained the trouble. It requires a tough tree to do well, in a heavy soil, the first season, without hoeing.

Another circumstance of no small import, is tying up the trees to stiff stakes, to prevent the wind from bending them, and loosening them in the ground. When they become loose, and the air circulates round the root, they have but little chance to live.

We have several times heard complaints that autumnal planting was unfavorable to the peach tree. Losses of this kind are sometimes owing to the soil, and sometimes to the climate. As we go eastward from the shores of the Cayuga, the winters become more severe, because the land rises, and recedes from the warm exhalations of the lake. Every tree of good size that is transplanted is more or less crippled in its roots; and in this state it is more helpless, or less able to resist severe cold than when it is vigorous, and has taken a firm hold on the soil. In some situations it may therefore be best in autumn, to lay the trees in trenches, covering the tops well with evergreens, and afterwards set them out in the spring. At this place however, such precautions are unnecessary,—for we have transplanted with success at all times when the trees were leafless* and the weather suitable.

We will now recur to the soil. Holes dug in close clays, will hold water like a tub; and when the tree is planted with loose earth over its roots, they *soak*, and not unfrequently perish from this single cause. The soil cannot be packed too closely and firmly round the roots; but still it may prove unavailing without something more. G. V. Sackett of Seneca Falls failed entirely with a semi-circular row of trees which he planted some years ago in front of his brick mansion. He then cut a ditch, filled in stone, and planted big trees over it with eminent success. The soil is a very close clay. In all such situations, we should therefore recommend that a drain under where the row of trees is to stand, should be first made; and with the plough and shovel, used alternately, it may speedily

* It is an easy affair to strip a young tree, and make it leafless, when it is to remain a day or two unplanted; but when it can be removed and set immediately, we should prefer having the leaves left on. As soon as the sun crosses the line in autumn, if the weather is cool and the ground wet, it is safe to transplant—at least we have never succeeded better than at such a time and under such circumstances.

be done. Gravel, or any kind of coarse rubbish, will do for filling. There is nothing in stiff clay that we have discovered, unfavorable to fruit trees,—if it be well drained, and kept reasonably mellow near the surface. †

Wisconsin and its inducements to Emigrants.

Messrs. Editors—Having recently visited the Territory of Wisconsin, and examined it with reference to its agricultural importance, I have thought that perhaps a hasty sketch of its soil and climate, and its general inducements to emigrants, might interest the readers of your journal. Wisconsin lies on the west side of Lake Michigan, and is bounded west by the Mississippi river, containing an area of land considerably larger than the State of New York. It is at present divided into thirteen counties, only the southern portion of it being surveyed and organized into counties. It now contains a population of about 31,000 inhabitants, having increased over 12,000 within the last two years. The climate is more temperate than the same latitude in the State of New York; there is more fair weather, and less rain and snow, than in New York; from what cause I know not, but the thermometer and the meteorological table kept in the Territory, prove this to be so. Experienced agriculturists residing in the Territory, say that the seasons are longer there than in the State of New York, and I am inclined to think this is true, as vegetation was two or three weeks in advance of us when I was there. Wisconsin is a rolling country, in some places hilly, though not too much so. There are scarcely any swamps in it, unless it be in the north part and west of the Wisconsin river. The rivers, creeks, and small lakes, which are numerous, contain clear water generally supplied from springs with gravelly bottoms—consequently the inhabitants are not subject to ague and fever or any bilious complaints. On the whole, I am of opinion that Wisconsin possesses a milder and as healthy a climate as that of New York.

The country generally, with the exception of the Lake shore, consists of prairie and burr oak openings, and the soil is equal probably to any in the world. It consists of a deep sandy loam, easy of cultivation, and produces large crops of wheat, corn, and all of the coarser grains; the rate of production equals that of the best land in Western New York. There is probably not timber enough in some parts of the territory to supply the wants of the agriculturist, but this can in a great measure be remedied by planting locust and other forest trees, which grow with great rapidity. The chief inducements to emigrants are the cheapness of land, healthy climate, and the facilities with which a farmer can commence operations. Land can be purchased second-hand, for from \$1 50 to \$3 00 per acre; or at Government price, \$1 25 per acre. Farmers usually contrive to take part prairie and part openings. It costs now \$2 50 per acre to break up prairie the first time, and after that one team will plough it with ease. The openings are free from underbrush, and the farmers generally girdle the trees, and plough and sow among them without chopping. In this way they get good crops: the trees are about as wide apart as the trees in a common orchard. A farmer arriving in Wisconsin with \$500, is about as well off as a farmer here owning a farm worth \$3000. Yet I would advise a man who is well enough off where he is, to stay there and let well enough alone. But a man who has a large family which he wishes to bring up farmers, or a man who has but little to begin life with, had better emigrate to Wisconsin. I would rather have \$100 in money in Wisconsin now to start farming with, than \$500 here; the Wisconsin farmer will be the best off in five years. Wisconsin, too, has fine openings for mechanics of almost every trade. Its laws are similar to those of this State, with few ex-

ceptions. The laws in favor of debtors are rather more liberal: \$100 value of the farming utensils of a farmer, are exempt from execution, and they exempt many articles of furniture which are liable to be taken in this State. There is no imprisonment for debt arising upon contract; the laws in that respect being nearly a transcript from our statutes.

A farmer wishing to emigrate to Wisconsin, would take a steambot, brig, or schooner, as the case might be, at Buffalo, and land either at Milwaukee, Racine, or Southport, (Racine I think the preferable place,) and then go out into the country. Steamboats are usually about five days going round, and sail-craft a few days longer; or emigrants may go by land, in which case they would go through Michigan to Chicago, and then strike into the Territory at any place they might wish. Sail craft are much the cheapest, and are said to be as pleasant and quite as safe as steamboats. I suppose a family of five or six persons could go round in a brig and be found, for \$50 or \$40. In conclusion, I will reiterate, that if a man is well off, stay where he is; if not, and he is willing to undergo some privations incident to all new countries, pack up and go to Wisconsin, particularly if he is a farmer or a mechanic.

Yours very truly,

L. H. NICHOLLS.

Lockport, September 19, 1840.

Important Experiments—Sowing Seeds.

MR. M. B. BATEHAM—You ask for information respecting the cause of failures of seeds—I therefore send you an account of some experiments made by me the past season.

I prepared half an acre of land for Mangel Wurtzel, and obtained the seed from your agent at Canandaigua. After soaking the seed one day, I commenced sowing; but rain came on, and the soil being rather clayey, it was a whole week before I could sow the remainder. The seed was soaked all this time, and supposing it was spoiled or injured, I sowed it thicker than usual, and had not enough to finish the ground. Accordingly I sent to the same place and got more seed, and sowed the remainder without any soaking; so that part of my ground was sown with seed soaked one day, another part one week, and a third part not at all.

Now for the results:—The part soaked one week, came up first, and much too thickly;—the part soaked one day, came up slowly and very thinly; while the part not soaked, did not come up at all. Thus showing conclusively, the necessity of thoroughly soaking these seeds, and the little danger there is to be apprehended from soaking too long. I am confident that inattention to this subject, is the most frequent cause of the failure of the Mangel Wurtzel and Sugar Beet seeds.

Respectfully Yours,

A. B. RAPALJEE.

West Farmington, Ont. co., Sept., 1840.

Improved Short Horn, or Durham Cow, "Young Lily."

EDITORS OF NEW GENESSEE FARMER.—GENTLEMEN—I beg to give you the following information, respecting a thorough-bred improved Short Horn or Durham Cow, of the most esteemed blood; in case you may think it worthy of a place in the New Genessee Farmer, which is extensively circulated in this neighborhood.

"Young Lily," now four years old, has given from twenty-six to thirty and a half quarts of milk per day, since the 29th day of last July. In August the milk she gave in seven days (14 milkings) was kept separate from the milk of the other cows, and the cream, when churned, produced eleven and a half pounds of butter. The weather was then so hot that the milk was allowed to stand only 21 hours.

We have this day churned the cream taken from seven days' milk, (14 milkings,) and have the *solid satisfaction* of having fifteen pounds of beautiful butter. (This milk remained unskimmed 36 hours) Young Lily has had no food but grass, and is always in very high condition.

The above affords one proof of the propriety of selecting improved Short Horn or Durham Cows for dairy stock; of their aptitude to lay flesh at a *very* early age on the prime parts, and that more abundantly than in any other breed, I shall say nothing; as that fact is established wherever they are known.

I am, sir, your ob't servant,

JOHN WETENHULL.

Hankeloc Farm, Nelson, Gore District, U. C.

Cultivation of Dactylis, Glomerata or Orchard Grass.

Messrs. Editors.—GENTLEMEN—In answer to the enquiries of Sereneus, in his interrogatories through the medium of your journal, I beg leave to remark that I have been in the habit of cultivating the Orchard Grass, both for seed and hay, for the last 25 years, and am of the full conviction that it stands as high for hay or feed as any other. As to the soil best adapted to its growth, I conceive that moist rich loam is the best; but I have found that when I have sown it among other grasses for pasture, it grows luxuriantly; and in cases of severe drought, when all other grasses are apparently dead, this stands the best, being all the time green and fresh. The best time for sowing the seed, I conceive to be about the middle of July or first of August, as probably Nature directs this the best time for sowing, when the seed comes to maturity, which is about that time, or earlier,—to be dragged in on mellow land,—yet I have always stocked in the spring with oats, at the rate of a bushel to the acre, and if the oats are not too heavy it generally grows well. Its value for hay, I think, stands as high as any other grass, and for feed and the second crop it stands pre-eminent, as it comes forward earlier in the spring and holds out longer in the fall. On my farm in Connecticut, from whence I removed this spring, I usually cut from two and a half to three tons per acre, exclusive of the seed which I reaped before mowing in the same manner as I would wheat, and generally secured from 15 to 20 bushels of seed to the acre. The second crop yields from one and a half to two tons per acre.

I know not how this grass will grow in this country, but I doubt not that the soil here is admirably adapted to its growth, as the land is rich, and in my opinion will grow well almost every kind of grass that the farmer may wish to cultivate. I brought with me a small lot of seed, and stocked last spring with oats about an acre of land; and the result is I have a fine piece of orchard grass, which is coming forward to my entire satisfaction. I intend to save seed enough next year to stock more, and furnish my neighbors some should they wish. In conclusion, I would advise "Sereneus" to try this kind of grass, and presume he will find it for his interest to grow it for both pasture and hay.

ZACHARIAH CONE.

Bataria, September, 1840.

Remarks.—The increasing number of our able correspondents must be highly gratifying to our readers, as well as encouraging to ourselves. We are much indebted to Mr. Cone for his valuable communication. Will he have the goodness to state in our next what quantity of orchard grass seed is requisites for an acre, and whether any preparation is necessary to ensure its vegetation?—Eds.

Frost.—We have had but one visit from Jack Frost this fall as yet, and that was very slight on the morning of Sept. 21.

For the New Genesee Farmer.

On Raising and Cleaning Clover Seed—Clover Machines.

MESSEURS, EDITORS.—In your last paper you acknowledged the receipt of my communication on the subject of thrashing and cleaning clover seed; and you also required more minute details on the subject.—I willingly give you my experience and observation.—I will treat the subject systematically, and take each query proposed by you in order.

1st. *As to the kind of Soil.*—As far as I have been able to judge, a sandy, or loamy, or in fact, any light soil is best adapted. It seldom does well on clay soils.

2d. *As to the time and frequency of Sowing.*—We generally sow in the first opening of spring, while the ground is moist and open; in order to give the seed a chance to penetrate a little into the ground. There are many farmers who sow as early as the beginning of March; and some sow when there is a little snow on the ground, to enable them (they say) to sow more accurately. Clover intended for seed, ought never to lay more than two years, because, after this, much of it will run out, and make room for various kinds of grass and noxious weeds,

3d. *As to the time of Cutting.*—On this point I entirely coincide with your valuable correspondent, Mr. HARMON, that the seed should be perfectly ripe. 1st. because it will yield more seed per acre when sold by weight; and 2d. because it will thrash at least one third easier.

4th. *Is the first or second crop best?*—Experience teaches us that the second crop will yield generally about one third more: the reason we suppose to be, that the first crop, ripening in the heat of summer, ripens too speedily, and consequently the seed is very much shrunk, and of course a very bad sample.

5th. *Amount of seed obtained from an acre.*—We generally expect, on suitable soil, from two to four bushels; but this depends much on the season; a wet season being by far the most productive. We seldom cut more than a bushel per acre on stiff clay soils.

6th. *Whether the thrashing cannot be done by a thrashing machine instead of a flail?* I have seen this tried several times. 1st. with a spiked machine. We found that it took as long to separate the heads from the straw—the latter being mostly broken up—as it did to thrash it with a flail; and also, that after doing the best we could with it, there remained nearly double the bulk of chaff, and broken straw mixed, to be thrashed with the clover machine, allowing for the services of the machine two extra men and four horses. It was next tried with what we call a beater machine. We found this the best in one point; the straw was somewhat broken up; but, as an offset against this, we found it impossible to make it thrash clean.—We therefore concluded that the flail was by far the best.

7th. *What is the cost of a clover machine with and without the horse power?*—To this I must observe that I have seen the kind mentioned by your friend HARMON, and those made by Mr. Burrall of Geneva; but I consider the kind briefly mentioned by me in your last paper, not only the most convenient for a stationary machine, but likewise the cheapest; a friend of mine having made several of them (without horse power) for \$40, materials inclusive.

8th. *Can the clover machine be easily adapted to the different horse powers used in thrashing wheat; and what amount of power is required?*—This query may be speedily answered by the fact that I never knew a farmer who had a separate horse power for his clover machine. The generality of clover machines can be worked with three horses, but four are best.

There is another point which you forgot, and I had nearly forgotten to mention. It is the quantity of

seed necessary to sow an acre. We usually sow a bushel on six acres, but some farmers consider a bushel to ten acres to be sufficient.

Remarks.—The plan usually pursued in this county for raising clover is this: We seed our wheat at the time above mentioned. After harvest we are careful that nothing feeds on this clover for the remainder of the season, for it injures the young clover very much. The next season we cut a crop of hay, say about the middle of July; then sow on about two bushels of plaster, and let it grow for seed. We repeat this the second season, and the ensuing spring we plough up for fallow.

Yours, &c.,

W. N. H.

Yates co., Sept. 1840.

For the New Genesee Farmer.

Infiltration of Manures.

The last Cultivator offers some proofs of the infiltration of manure. The fact I will not deny, I only wish to explain the forced or accidental manner in which it is done.

I have long been of opinion that most of the gasses of manure escaped upwards through the component particles of the soil, and that this was the reason why ashes or lime by their affinity for those gasses prevented their escape, when both manure and ashes on its base, was applied to a sandy soil.

Dr. Jackson says that "the water in barn yards is never pure," this is no proof of the infiltration of manure when it has a chance to escape to the atmosphere. As pure water as I ever drank was surrounded by fields and gardens highly manured by vegetable matter and muddled fish. Had these substances been present in such masses as encumber the barn yard, an unnatural infiltration might have been produced to the injury of the spring.—Nature is very consistent in her laws—it is always her design to form new combinations out of decayed matter, but if a man frustrate her intentions by piling up vegetable substances to suffer a useless decay and consequent infiltration, is it her fault?

In the lower parts of our seaport towns, well water is often impregnated with sea water. This is doubtless owing to the pressure of the spring tides, which occur every full of the moon. The nitre of cellars, and other pent up animal matter, is also artificially forced to infiltrate, because an escape to the atmosphere is denied to them. Hence the impurity of well water in populous cities.

Commissioner Colman of Massachusetts, says, "there is salts of lime enough in the waters of the Boston wells to make ten statues of Lot's wife, as well as other impurities not to be named."

If the presence of lime in Boston water is any proof of the infiltration of manures, we might as well say that the organic remains found in lime-stone, the little antediluvian *Crustacea* themselves, had infiltrated.

As I have said before, it is always the design of nature that nothing should be lost, and that her domain should be perpetually enlarged. In tropical climates where heat and moisture are not impeded in their action by a long season of frost, the excess of decomposed vegetable matter instead of sinking below atmospheric influence is continually forming new combinations on a most gigantic scale. Bonpland tells us that near Cumana there is a species of *Cactus* thirty or forty feet high (*trente au quarante pied de hauteur*). This seems almost incredible when we reflect that our own *Cactus opuntia* is rarely found more than two feet high. Humbolt says that in the woods of Guana the whole earth is not only overloaded with plants, but also the trunks of trees are covered every where with the *orchidea* and the plants of the genus *Piper*

and *Pothos*, and that the Lianas creep from tree top to tree top, at a height exceeding a hundred feet, forming a most agreeable shade from the vertical sun.

SENECA.

Proofs of Infiltration.

The question of infiltration, or the tendency of animal and vegetable matters to descend in soils, is a matter of considerable importance, as on it is greatly depending the decision of the proper position of manure in the soil. Some maintaining that manures never sink below where the ground is moved, advocate the placing of manures deep in the soil; others believing that the most valuable parts, the soluble salts, in such cases speedily pass beyond the reach of the plants, prefer a slight covering, that allows the manure to remain as near the surface as possible. On this subject Dr. Jackson makes the following remarks:—

The infiltration of manures is doubted by some, but the condition of our wells prove it. The water in a barn yard is never pure. As much as a tea-spoonful of vegetable matter to a gallon is often obtained from waters that are considered pure. This may be seen by any one who will evaporate the Boston water to dryness. In the purest water obtained from lakes, 1½ grains of vegetable matter to the gallon may be obtained. In the water of Boston 38 grains are found to the gallon. Soils brought from 150 feet depth in this neighborhood, are found charged with vegetable matter."

The Massachusetts Commissioner, Mr. Colman, says:—

"There are salts of lime enough in the waters of Boston wells drank every year, to make ten statues as large as Lot's wife, and as to other ingredients or impurities, which, according to Dr. Jackson's account, exist in it, they are not to be named."

Such facts prove incontestably, that manures do infiltrate, or descend, and the natural inference, therefore, would be, that to produce the best and greatest effect, they should be buried near the surface.—*Alb. Cultivator.*

Clover Seed—Its Culture—Machines for Cleaning.

MESSEURS, EDITORS.—The common clover—*Trifolium pratense*—called little or medium sort, is the kind in general use and for sale in this county. It is generally mowed for hay about the middle of June, the seed is obtained from the second growth, which is cut as soon as the seed is ripe, say from the 10th to the last of September. It is then drawn to the barn and thrashed with a flail or horses, until the heads are separated from the hay; the hay is then nearly all raked off, if bright, it is stacked for fodder, but if damp and mouldy, it is consigned to the barn yard for manure. The heads, still encumbered with more or less hay, are then ready for the clover machine—most farmers in this vicinity bring their thrashed clover to the stationary clover mill in this village, where it is cleaned for every tenth bushel. The clover machine here cost \$100; it is attached to a plaster mill and is carried by water power; the cylinder is 33½ long and 3 feet in diameter, and makes 330 revolutions in a minute; it has cleaned, ready for the fanning mill, five bushels in an hour.

Portable machines with 16 to 20 inch cylinders may be purchased of E. Hurlburt in this village, at from \$60 to \$80 each. These small cylinders make more revolutions; but any kind of horse power may be attached to them.—Several kinds of horse-power may be had here, from the improved horizontal to the inclined plain and endless chain. Cost, \$90, to \$150.

A clover machine of the largest size is supposed to require about one half the power that is required to thrash wheat—the small cylinders require about the same power, the revolutions being increased.

The yield of clover seed is very unequal, depending very much on the weather and the season; five bushels to the acre has been gathered, but three bushels is nearer the average. We know one farmer in the town

of Fayette, who raised one hundred and thirty bushels in one season.

Clover likes a calcareous soil, it grows well on stiff clays, not destitute of lime, but it grows larger on a rich sandy loam.

The larger sort of clover being a later species, yields its seed only with the first crop. It ripens about the middle of August. S. W.

Waterloo, Seneca co., Sept. 10. 1840.

From the Farmers' Visitor.

Scotch Husbandry.

The secret of the success of British Agriculture, is the proper division and application of expense and labor. Until the Highland Agricultural Society was formed in Scotland, in 1781, that country was as poor in its agriculture, as any well be conceived. The face of Scotland, in the middle of the last century, was "as black as a howling wilderness;" up to that time, all the manure used upon the farms was put upon a little patch; no wheat of consequence was raised; the oat crops were full of thistles and weeds; and there was no rotation of crops. But by the concentrated efforts of the members of the Highland Society, means have been sought for obtaining and applying all the valuable manures, and bone dust has been brought from foreign countries; the turnip husbandry has been gradually introduced, with other green crops—which, in that country, are substitutes for our Indian corn crops—rotations of five or six years is practised, and the price of rent per acre, of lands before the improved cultivation of little value, has been raised to eight ten, and twelve dollars, in the most distant parts of that country, where the business of raising cattle is almost exclusively pursued. The improvements of steam carriage, by land and water, have brought the most distant counties of Scotland near to the Smithfield cattle market of London, and that country is now said to be richer in her arable lands than any other part of Great Britain.

The perfect system of British farming is worthy of our attention, an immense saving is realized in every large establishment from this system—the arrangement and system of the Lowell manufacturing establishments were copied from those of Manchester, so far as the condition of the two countries would admit; and the great farming establishments of Great Britain are conducted with as much order and system as are the manufacturing establishments: every man, every beast, every tool, has its place, and no time is lost in the day's work of any man. Horses are generally used, and perform with the plough or harrow, or other implements, much of the work that is done in this country by hand: a team of horses and a man are calculated to do the work of fifty acres of land, while the crops requiring the hoe in Scotland, are attended by females and children. The potatoes are planted and dug by the plough, and in almost every crop, which here requires the hoe, there the work is done by the plough.

The expense of human labor is less in that country than in this. The annual cost of a pair of working horses is set down at seventy pounds sterling—that of a man to drive them, thirty pounds, the whole cost of the team being two pounds ten shillings sterling an acre. This team labors every working day in the year, is well kept, so that the horses are worn out only by age. It works its regular hours every day, never varying; these are, ten hours in the summer and eight hours in the winter, and thus regularly secures to the farmer a full equivalent for the cost of his labor. —Hon. Isaac Hill's Address.

A Good Farmer.

One of the finest farms in the county of Philadelphia, is that belonging to our friend General CANTON, situate in Oxford township, near the pleasant borough of Frankford; and we may hardly add, that one of the most skilful, persevering, and successful agriculturists within the same limits, is the proprietor of that farm. We saw standing last week, one of the most beautiful fields of about twenty acres of wheat we ever beheld, which would average at least five and twenty bushels to the acre. His oats,—some of them at least,—look like a forest of young oaks, and we venture to say has seldom ever been excelled. Some of the stalks of which, now in our office, measure upwards of six feet. Of hay, the General will cure a larger quantity than perhaps any other farmer in Pennsylvania,—for we believe, and it is indeed so estimated by others who are better judges than ourselves, that not less than three hundred tons will be obtained!

These immense crops however, are not obtained from poor land and light manuring, and by trusting the operations of the farm to the superintendance of others; for the old General is too good a husbandman to fall into any such fatal error. Manure is applied with an unsparring hand,—indeed, scarcely one thousand dollars per annum, would cover this item of expense; while the eye of the master, which Dr. Franklin says will do more than both hands, is ever on the alert, in directing the various duties of his rich and beautiful plantation. —Germantown Telegraph.

Measuring Corn.

The following rule for ascertaining the quantity of shelled Corn, in a house of any dimensions, is by William Murray, Esq., of South Carolina, and was read before the St. John's Colleton Agricultural Society, and commented by them for publication in the Southern Agriculturist.

Rule—Having previously levelled the Corn in the house so that it will be of equal depth throughout, ascertaining the length and breadth and depth of the bulk; multiply these dimensions together, and their products by 4, then cut off one figure from the right of this last product. This will give so many bushels and a decimal of a bushel of shelled Corn. It is required to find the quantity of ear Corn, substitute 8 for 4, and cut off one figure as before.

Example—In a bulk of Corn in the ear, measuring 12 feet long, 11 feet broad and 6 feet deep, there will be 316 bushels and 8 tenths of a bushel of shelled Corn, or 663 bushels and 6 tenths of ear Corn, as:

12	12
11	11
6	6
792	792
4	8
316.8	633.6

The decimal 4 is used when the object is to find the quantity in shelled Corn, because that decimal is half of the decimal 8, and it requires two bushels of ear Corn to make one of shelled Corn. In using these rules a half a bushel may be added for every hundred, that amount of ears results from the substitution of the decimals. —Am. paper.

Tomato.

The following is extracted from the Baltimore Morning Sun.

"But we were discoursing on the nutritive qualities of the tomato. This is a vegetable which deserves a far more general use. We know of no article that grows in our region of country that is more healthful. It is well known that this fact has procured for the plant a medical standard. We doubt this has not been entirely overrated. The idea started by a certain medical gentleman several years since, was a proof of this, and very likely grew out of the circumstance of the healthful effects of a tomato diet, during the prevalence of miasmatic diseases, which affect the biliary organs in a greater or less degree—these being the class of diseases in which physicians most generally resort to emolent. But there can be no mistake as to the tonic effects of the vegetable under notice; and we feel justified on the word of a medical friend, in recommending it to the use of those debilitated from the ravages of disease peculiar to the warm months—we mean those affecting the bowels. It strikes us that if tomatoes, prepared with large quantities of stale bread and liberal use of salt, in the ordinary steaming mode were adapted as the food for children laboring under or recovering from "summer disease," the result would be highly gratifying. The experiment is well worth the testing. Of course unrestrained indulgence in their use must not be allowed by the parents."

Paint your Tools.—Every farmer should be provided with a small quantity of the coarser kind of paints—a few paint pots and brushes and paint oil. It is very easy to mix them, and by keeping a small supply, he might keep his implements always in a good state of preservation. The expense would be trifling, and the trouble next to nothing; and besides it is wisely ordained that we can neither sow nor reap without trouble. The greatest of all troubles must be that of having nothing to do. To have a place for every tool on the farm, and to keep them all painted and in good order, and when not used, protected from sun

and air, ought to be an amusing as it is undoubtedly a binding obligation on every farmer. —Am. Farmer.

Foreign Sugars.

According to the Report of the Secretary of the Treasury, the imports of Sugar into the United States, during the year ending 30th September, 1839, amounted to 132,580,527 lbs. There were also imported of white and clayey sugar, &c., 12,690,646 lbs, making a grand total of 195,131,174 lbs. Of this quantity there were imported into Boston, 36,669,297 lbs.; into New York, 75,212,936 lbs.; and into Philadelphia, 20,107,537 lbs.; into Baltimore, 17,318,160 lbs.; into New Orleans, 5,382,818 lbs.; into Charleston, 5,369,172 lbs.; into Norfolk, 4,172,134 lbs.; into Salem, 1,761,218 lbs.; and the balance into smaller ports. —Am. Farmer.

For Farmers' Wives and Daughters.

There is a great deal of excellent good sense in the following passage, which we take from an address delivered a short time since before the Essex County Agricultural Society, by Allen Putnam, Esq., of Danvers, one of the Representatives of that town.

"I have a few words for the farmers' wives.—However skilful, industrious, and prudent, your husbands may be, their success in money making depends as much upon you as upon them. Economy and skill on your part in turning every thing to the best account, are essential to profitable husbandry.—Perhaps there is scope for study, experiments, and improvement in your departments. All are not equally successful in the management of the dairy. Poor pastures, poor cows, poor cellars, are the alleged reasons for the dillicence in results. These things undoubtedly are often the causes of failure to obtain butter in large quantities and of good quality. But may not the fault sometimes lie with the dairy woman?—Is her business so simple as to be always understood? You begin to suspect that I doubt whether some of you perfectly mastered the art of butter making.—It may be an ungallicant doubt, but listen to the particulars of one case in point, and then judge whether I can help doubting. As stated to me, the facts are these.—One of our farmers, the summer before last, employed successfully, and for short terms each, three dairy women. Here the cows, the pasture, the cellar, and all the dairy apparatus were the same; and how was the result? One obtained seventeen pounds of butter per week, the second twenty-three, and the third twenty-seven. Such acts should induce many of you to vary your processes and note the results.

Philanthropy, looking forward, sighs at consequences which must follow from things that are taking place in the habits and employments of your daughters. Circumstances beyond your control have thrown the healthful spinning wheel upon the pile of rubbish in the garret. Housework and the dairy do not furnish sufficient employment for the females.—Either mothers or daughters must resort to something else by which to contribute a share in the support of the family. It is too commonly the case that the daughters resort to some occupation that is not sufficiently active and invigorating. The needle is taking the bloom from many of their cheeks, and vigor from their frames. The evil is augmented by that mode of dress (I ought to use a harsher term) which obstructs the natural and healthy development of lungs and chest; also by avoiding exposure to the weather; and a too eliminate reliance upon the horse for services which heaven intended should be rendered by their own limbs! The lamentable consequences will not be confined to men; children will inherit the feebleness of their mothers, and a sickly race will come after us.

Useful as the needle is, and beautiful as are its contributions to our show, I appeal to the mothers to forbid its excessive, its constant use by their daughters. I entreat them, as they value the well being of their children, to give to their daughters daily and thorough training in the care and labor of the dairy and of all household affairs.—It were well—well for them and a future race, that they should revive the acquaintance which their mothers had with the milking stool, the garden, and to some extent the field; for then bloom would flow in fuller tides through all their veins; they would acquire vigor of body and soundness of mind, that will contribute to their usefulness and enjoyments, when time shall bring them to the places which you now hold—shall make them the wives of farmers, and mothers of the rising generation."

CATTLE SHOW

And Agricultural Fair, at Rochester, N. Y.
To be held on Wednesday and Thursday, the 7th and 8th of October, 1840.

At a meeting of the Executive Committee of the Genesee Agricultural Society, held at the Arcade House, Rochester, the 12th day of August, it was Resolved, That in view of the interest which many have manifested in the success of the Society, and relying on the liberality of the friends of Agriculture to furnish the means, we will take the responsibility of offering FIVE HUNDRED DOLLARS, for premiums and expenses at the Annual Exhibition of the Society, on Wednesday the 7th day of October, as follows:—

ANIMALS.--HORSES.

- 1. For the best Stallion,.....\$15.00
- 2. Second best do.,..... 10.00
- 3. Best breeding Mare, (with a colt,) 10.00
- 4. Second best do.,.....do..... 5.00

CATTLE.

- 5. Best imported Bull,..... 20.00
- 6. Best improved native bred do.,.... 15.00
- 7. Best imported Cow,..... 15.00
- 8. Best improved native bred do.,.... 10.00
- 9. Best yearling Bull,..... 7.00
- 10. Second best do.,..... 5.00
- 11. Best yearling Heifer,..... 6.00
- 12. Second best do.,..... 4.00
- 13. Best Bull Calf 5.00
- 14. Second best do.,..... 4.00
- 15. Best yoke of Oxen,..... 10.00
- 16. Second best do.,..... 7.00
- 17. Best yoke of 3 year old Steers,.... 6.00
- 18. Best yoke of 2 year old do.,..... 4.00

SWINE.

- 19. Best Boar, showing the most thorough breeding, and uniting the most valuable qualities,..... 8.00
- 20. Second best do.,..... 5.00
- 21. Best breeding Sow,..... 6.00
- 22. Second best do.,..... 4.00
- 23. Best 3 pigs, not more than 9 months old,..... 5.00
- 24. Second best do.,..... 3.00

SHEEP.

- 25. Best Buck, uniting the most desirable qualities both for the fleece and for the carcase,..... 10.00
- 26. Best do. for the carcase only,..... 8.00
- 27. Best do. for fleece only,..... 8.00
- 28. Best 3 or more Ewes, as in 25,..... 8.00
- 29. Best 3.....do. as in 26,..... 6.00
- 30. Best 3.....do. as in 27,..... 5.00

FIELD CROPS.

THE PLOUGHING MATCH.

Three fine PLOUGHS, of different patterns, worth \$25, will be given as premiums by the Ploughmakers of Rochester. The person entitled to the first premium, to have the first choice, &c. Horse teams only are to be used. The decisions to depend on the manner of execution, as well as the time of ploughing one quarter of an acre of green sward land.—(Competitors are desired to send in their names two or three days previous to the Fair.)

Discretionary Premiums will be awarded for such articles not enumerated, as the committees may deem deserving.

No premium will be awarded for articles which are not deemed worthy, or where there is no competition.

No person will be entitled to a premium, who is not a member of the Society. (Members will be admitted during the forenoon of the day of exhibition, or any time previous, on payment of ONE DOLLAR to either of the officers of the Society.)

Persons competing for premiums on field crops, are required to give a certificate of the weight or admeasurement of a part or the whole crops, attested by two disinterested persons; and also to give a written statement of the kind of soil and manner of cultivation, for publication in the New Genesee Farmer.

Persons exhibiting animals for Premiums, are required to give the Judges a statement of the age and pedigree of each animal as far as practicable.

The articles of Domestic Arts, Horticultural products and Implements, are to be numbered by the Secretaries, and the names of the exhibitors are to be kept by them, and not made known to the Judges.

ORDER OF THE DAY.

It is requested that articles of Domestic Arts and Horticultural productions, be brought in the day previous, if possible, or early in the morning on Wednesday.

The Animals for exhibition should be on the ground early in the day, so as to arrange all complete before 12 o'clock. Those who intend to exhibit animals, requiring pens, are requested to send word to the Seed Store, a few days previous.

The Executive Committee will meet at 11 o'clock to appoint Committees; and the Committees will proceed to inspect the articles at 12 o'clock.

The Ploughing Match will commence at 1 o'clock, and last about one hour.

The premiums will be announced at 3 o'clock; immediately after which,

An Address will be delivered by LEWIS F. ALLEN, Esq. of Buffalo, whose writings on Agriculture, and efforts in the Legislature, have done much for the benefit of the farming interests in this State.

The Annual Election of Officers of the Society will take place immediately after the Address.

THE SECOND DAY

Will be a Fair for the Sale and Exchange of Farm Stock, &c. Many fine Cattle will be offered for Sale, and an excellent opportunity will be offered for Farmers to improve their assortments of domestic animals.

Observations.—Pens will be provided for the exhibition of animals; and pasture can be obtained near the city for such as are drove in the day previous.

Nearly all of the principal farmers near the city have kindly consented that friends from a distance should turn their cattle into their pastures, during the evenings of the time of the Fair.

For further particulars, see bills on the day of Fair.

THE MECHANICS' FAIR.

The Second Annual Fair of the Mechanics and Tradesmen of Western New York, will commence on Tuesday, the 6th of October, and continue three or more days. This will be a great and splendid exhibition; and as the mechanic arts are intimately connected with agriculture, farmers will find this Fair highly interesting and useful to them. Let all turn out, and bring their families, so as to enjoy at least one rational holiday in attending the Fairs.

TO THE LADIES.

The Committees of the Agricultural as well as of the Mechanics' Fair, particularly invite the ladies to honor the Exhibitions with their presence, and with specimens of their handwork. Much of the interest of such Fairs always depends upon the ladies; and it is confidently expected that they will do themselves great credit on this occasion. Let farmers' wives and daughters show what they can do; and let them all come and see what others have done. (The families of members of the Agricultural Society are allowed to compete for premiums.)

L. B. LANGWORTHY, President.

H. M. WARD, }
M. B. BATEMAN, } Secretaries.

Genesee County Fair.

The annual Fair and Exhibition of the Genesee County Agricultural Society, will be held at the hotel of C. W. Van De Bogart, in the village of Alexander, on Tuesday the 14th day of October, at which time premiums will be awarded as usual, for the different kinds of domestic animals, field products, and miscellaneous articles. A very good display is anticipated and of course all the good farmers in the county will be present, besides some from neighboring counties.

Ontario County Fair.

This comes off at Canandaigua, on Tuesday the 20th of October, and from our knowledge of old Ontario, we have no doubt that she will do herself great credit on this occasion. The Society have thus far manifested a good degree of spirit, and we shall be much mistaken if we do not find a large and interesting exhibition at that place. There is sufficient wealth, intelligence and enterprise in Ontario county, to sustain a most efficient and spirited society, if the farmers will only lay aside their jealousies and unite their ef-

ts for mutual pleasure and improvement. Farmers need an occasional holiday, and how can it be had so profitably as by such exhibitions? How can farmers spend a day more pleasantly or more profitably than in becoming acquainted with each other, and in learning about each other's improvements and success in their profession?

Fair at Cleveland, O.

EDITORS OF NEW GENEESE FARMER—The Cattle Show and Fair of the Cuyahoga County Agricultural Society, will be held at this city on the 21st and 22d days of October.

The Society respectfully invite you and other friends to the cause to be present.

C. M. GIDINGS, Pres't.

J. D. WESTON, Sec'y.

Fair at Colborne, U. C.

The county of Northumberland Agricultural Society will hold their cattle show and Fair at Colborne, on Tuesday the 20th of October, when a liberal amount will be awarded in premiums as usual.

Lime as a Manure.

There is much land owned by readers of this paper, which would be greatly improved by the application of lime,—not only that which is periodically under the plough, but many an old pasture which yields scanty crops of very inferior quality.

When a farmer turns his mind towards this subject however, he is met at the outset by the startling item *expense*. Lime in our neighborhood is sold at twenty-five cents a bushel, and perhaps twenty cents the quantity. There are ways however, to evade this imposition. Marl (lime in a soft state, either pure or adulterated) is found in many parts of this district; and round old kilns, refuse lime often collects in great quantities, which is of no value at present, to the proprietors, and which might be had for a trifle. Except on the score of its being *clotted*, or being mixed with fragments of stone, it is equal to any lime for manure.

In different countries lime is applied in very different quantities. In England it varies from 100 to more than 600 bushels to the acre, while in France they are satisfied with about a tenth part applied triennially. At Paris,—who for more than thirty years has devoted herself to agriculture; who has been especially attentive to calcareous manures, examining the practice of her own countrymen as well as of foreigners, and making experiments himself,—says, "A quantity of lime which does not exceed a thousandth part of the tilled surface layer of the soil, a like proportion of drawn [washed] ashes, or a two-hundredth part of marl,—is sufficient to modify the nature, change the products, and increase by one-half, the crops of a soil destitute of the calcareous principle."

To ascertain these quantities, will require some calculation. If the soil be one inch deep, one cubic inch of lime will manure a thousand square inches of the surface; and it will require six thousand two hundred and seventy-three cubic inches to manure an acre, or nearly two bushels and nine-tenths. If the soil however, is three or four inches deep, it will require three or four times as much; and indeed Paris recommends that is equivalent to eleven and a half bushels to the acre, to be applied triennially.

To farmers of small capital, this method holds out great advantages,—for their revenue would be much increased at a small expense. To such we would particularly recommend it; and let a fair account of expense and profit be kept. There are other views of lime in regard to liming however, which we do not adopt; but this practice is economical and worthy of attention.

Some precautions given by the same writer, may be useful. He says, "It is essential that all calcareous manures should be applied in *powder*, not in a state of mortar,—and upon the earth when *not wet*. Until the lime is covered up finally, all rain upon it ought to be avoided, which reduces it to paste or clots."

It may be remarked however, that the thinner it is distributed over the ground, the less will be its danger of clotting; or if it should become so, from the very small size of the lumps, the sooner it will moulder and mix with the soil. In saying this, we have grass lands particularly in view; but with arable lands doubtless it ought to be speedily mixed; and a light harrow or the drag-roller would perform this operation best.

Cure for "Diseases in Poultry."

MESSES. THOMAS & BATEHAM—In answer to the inquiry of Mr. H. in your last paper, I would state that the disease mentioned is what we called the *croup*, in the south of England. My poultry have been affected with it in this country as well as in that. The remedy I adopt is a very simple, and at the same time a very effectual one. I have never known it fail of a cure. It is this:—open the mouth of the chicken and pour down its throat a tea-spoonfull of sweet oil, (other oil, or melted lard, will answer.)

Yours, &c., WM. LEAVER.

Poultneyville, Wayne Co., N. Y.

Great Exhibition and Fair of the Royal English Agricultural Society.

An esteemed friend in London has sent us some English papers, filled with accounts of the Second Annual Fair of the "Royal English Agricultural Society," held at Cambridge on the 14th and 15th days of July.

This was one of the most numerous and splendid agricultural assemblages ever witnessed. With its immense list of members, and their unbounded wealth and influence, we can readily imagine that the anniversary of this society created a display altogether without a parallel in the history of agricultural exhibitions. The wonderful improvements which have of late been achieved in British husbandry, were here represented in the greatest perfection. The immense numbers, excellence and beauty of the animals, implements and products of agriculture, brought together on this occasion, must have formed a spectacle well calculated to delight the eye and warm the heart of every one possessed of the least spark of patriotism or philanthropy.

It is highly gratifying to us, as Americans, to learn that our country was ably represented, and honorably noticed on this occasion. Mr. STEVENSON certainly did himself great credit, and deserves the thanks of his countrymen.

One of the papers received by us, is a new agricultural paper called the "Farmers' Journal;" a very large sheet, with a supplement, containing a long and interesting account of the whole *doings and sayings* on the glorious two days; together with four large and spirited engravings. The first represents the cattle yard and sheds; the second the dinner of the committee in the Hall of Trinity College; the 3rd the "grand dinner in the Pavillion at Downing, where between 3000 and 4000 persons sat down to dine together, and harangue, and give toasts, and drink to the honor of British agriculture and industry." The 4th is a sketch of the great ploughing match, "where 57 ploughs started in all their glory."

We wish it were possible for us to give our readers a full account of this festival, together with the pictorial representations; but even were it in our power, we fear that many of our readers cherish such an unreasonable dread of long articles, that they would not

thank us for our pains; so we must only select the choicest morsels, and take our pen and scissors, and cut up, and mail our English papers, pictures and all. But stop,—the Eastern mail has arrived, and here is our welcome friend, the *Farmers' Cabinet*, containing a condensed account of this great English anniversary. This will help us out of our difficulty and save our pictures; for with a little trimming, Mr. PENDER'S arrangement will suit our columns, and we think will benefit all of our readers who give it a perusal.

The meeting was numerously attended, and the business was conducted with perfect order and decorum, although it was supposed that 30,000 strangers entered the city of Cambridge between the hours of five and twelve o'clock on Wednesday. The sum realized for admission into the show-yard during the hours of exhibition, amounted to between £1600 and £1650 sterling, or more by £500 than was taken last year at Oxford.

The whole amount given as prizes, we have not seen stated; but it must have been very large. The first prize for each class was 30 sovereigns, or about \$140.

We feel a great desire to give a bird's-eye view of the fête, but scarcely know where to commence the sketch, knowing, too, that the difficulty will be as great in determining where to end; for the whole account ought to be given un mutilated, for assuredly, the heart of every agriculturist must warm, to witness in imagination only, such a multitude, actuated by one spirit and one mind, and all engaged in the furtherance of an object that must be dear to the heart of every true-born son of the plough throughout the world.

The reporter commences with a few remarks on the importance of the science of agriculture. (without, however, offering the least disparagement to commerce, manufactures or the arts) which ought to be preserved, for they are as applicable to this as to any other country. He observes: "But what would become of all the immense masses of people, which trade and commerce have, as it were, forced so recently and so suddenly into existence, if it were not for the astonishing progress of our agriculture? It is from this source that they can alone be fed, in all the vicissitudes of commercial advance and decline; for it is evident that no other means of procuring subsistence can be adapted to an increase of population, but the *incessant cultivation of the soil*: this is a point of the greatest political importance, and combines, and ought inseparably to connect this society, with the great moving power of the government; for, provided the people be *well fed and employed*, they cannot increase too rapidly.

Agriculture is the *root and trunk* of the prosperity of a country—manufactures and commerce are the *branches* emanating from it—a branch may be blasted or cut off, but whilst the root and trunk are sound and healthy, fresh shoots may be thrown out to supply its place; but if there be a canker at the root, and the trunk decay, the branches cannot flourish. Statesmen may imagine, that glory consists in extent of territory, the pomp of state, the greatness of revenue or the terror of arms; but an accurate knowledge of mankind should convince them, that true glory can only arise from governing a people, who, being free from the weight of oppression, and reaping the fruits of their industry, rejoice in the happiness of communicating to their descendants, the blessings of security and comfort: under these circumstances, a great population is the safeguard of the country, as well as its greatest glory. In England alone, in the space of eighty years, the population has been doubled; but to what do we owe this augmentation, but to our capacity of affording this population the means of subsistence? Commerce, trade and manufactures have undoubtedly brought the largest portion into existence, but it is *agriculture* which has been made capable of feeding them! Every encouragement, therefore, which can be given to the fruits and growth of our soil—whether in the shape of bread-corn, cattle, wool, or the other varieties of animal production, which forms so large a portion of the farmer's capital, and assists and remunerates him for the tillage of the soil—a calculation too often undervalued and despised by the engineer and manufacturer—is strictly conformable to the constitution of nature, as she seems to provide for an *indefinite* increase of mankind; and as the fruitfulness of the earth is likewise indefinite, there seems no rational obstacle to their united advancement, far beyond the point hitherto reached in almost any part of the known world.

The objects of this society are of the highest national importance, and the powerful means for carrying them into execution, which its extensive organization places at command, must render it a most efficient instrument for the improvement of agriculture, and the increase of national wealth and prosperity; but, notwithstanding its boasted pre-eminence in agriculture, England has, until lately, been far behind our continental neighbors in practical improvement—in the *scientific knowledge* applicable to the labors of the husbandman. *Ignorance and prejudice* have been, and to a great extent still are, impassable stumbling-blocks in the way of a more complete and extended success; the majority of farmers have yet to reap the fruits of an enlarged exercise of skill and knowledge, and to *unlearn* many a grievous, but long cherished error, and to get rid of prejudices as deeply rooted in their minds, as they are opposed to their best interests; time must necessarily be allowed for all this, but proceeding on the plan which the society has adopted, it will assuredly be effected in the space of a very few years."

But we hasten to lay before our readers the opening of the great festival, which was, most appropriately, ushered in by a grand ploughing match—that most important of all agricultural operations, which, however, seems to be overlooked in a strange way by our agriculturists generally. The premiums awarded amounted to 51 sovereigns, for which 57 ploughs started in all their glory!

Scarcely before tea o'clock, the judges gave the signal to start, and a most beautiful sight presented itself! Most of the 114 horses—each farmer having sent his choice cattle with the best plough—decorated with ribbons, in a moment were set in motion, and the trial commenced in right good earnest, and was carried on with vigor throughout. Amongst the most prominent in the best work effected, was that which was done by two boys and a man with a Scotch plough—in lead it was a scalded point, after the first half-hour's work, that the boys were sure of reward, if not the first. The whole field, of 50 acres, was ploughed up, generally in prime style, by a quarter before twelve; the two boys having finished their work rather earlier than the others; and the judges almost immediately proceeded to their inspection; and at 1½ past two o'clock the President, the Duke of Richmond, awarded the premiums, two of which fell to two brothers, by the names of Salomon, one of whom, only 15 years of age, won a hat, which he had won at a former ploughing-match! The subscription to make up these prizes, amounted to nearly £100 sterling!

It is added, and we can readily believe it,—“This part of the business of the day passed off *very* satisfactorily.”

The Reporter now conducts us to the exhibition yard. “The cattle yard is an area of four acres and a half, enclosed by a fence nine feet high, having two gateway entrances for the admission of cattle, agricultural implements, &c., and four entrances for visitors on the south side; the arrangements to prevent confusion being admirable. The whole of the interior, sixteen feet from the outer fence, is surrounded by cattle-sheds, the roofs of which project six feet over and beyond that required for the cattle, for the protection of visitors, should the weather prove so unpropitious as to render shelter desirable. An inner quadrangle, enclosed by the cattle sheds, had been set apart for the exhibition of seeds, vegetables, corn, grain, and agricultural implements, as also for sheep and pigs. The cattle were supplied with water by means of cast-iron pipes, laid for the purpose. The public were admitted as early as six o'clock in the morning, by paying 2 shillings and 6 pence per ticket, and from that hour until 12 o'clock at noon at the same price, after which, until 7 P. M. at 1 shilling each.

THE PAVILION OF DOWNING COLLEGE.

When the proximity of the vast number of persons, who had been drawn together at the yard, had been in some degree satisfied, the next grand object of attraction was the dinner, to be given to the general body of the members of the society. The demand for tickets by non-members was at one time so great, that two and even three pounds was offered as a premium to any one to sell his right of entry to the pavilion. * * * The gallery was early filled with ladies, whose presence gave a gaiety and brilliancy to the scene.

The pavilion was erected on the quadrangle of Downing College; the roof is in seven compartments,

supported from beneath by strong pillars of wood. The interior consists of an apartment capable of dining 3000 persons, the tables and seats being so arranged as to face the high table, which is elevated four feet above the ground, and will seat sixty persons; this being set apart for ambassadors and foreigners of distinction, honorary members, professors of geology, chemistry, &c., &c. Upon the ground, immediately in front of the platform, are tables and seats for 300 persons in two divisions, intended for the judges of stock, farm produce and implements, the reporters for the public press, &c. There are two large windows of stained glass, at each side of the building, the framework being of wrought iron; the construction of the roof is novel, the braces and ties being also of wrought iron, which gives it a very light and elegant appearance. The dimensions are, 200 feet from east to west, and 127 from north to south; and, looking from the chair, the view has the appearance of an amphitheatre; the ventilation, by means of 80 windows, was complete, and no complaint was heard of oppression by the heated atmosphere, notwithstanding the great number of persons present; including the ladies, there must have been in the hall not far short of 3000 individuals! The erection of this building, together with the expense of the yard, dedicated to the show of cattle, caused an expenditure of £1560.

The number of horses, cattle, sheep, hogs, implements, seeds, &c., displayed, was absolutely splendid, and the premiums devoted to their improvement must have amounted to a very large sum; we cannot forego the pleasure of reporting the names of each class of animals, much as it will add to the present article, which it is to be feared has already extended to a wearisome length.

Class 1.—For Short-Horned Cattle.
Class 2.—For Hereford Cattle.
Class 3.—For Devon Cattle.

Class 4.—For Cattle not qualified for either of the above classes.

Class 5.—Horses.
Class 6.—Leicester Sheep.
Class 7.—Southdown and short-woolled Sheep.
Class 8.—Long-woolled Sheep.

Class 9.—Pigs.—Prize 1.—For the best boar,* adjudged to Mr. Barnard, of Gosfield-hall, Essex, for his 1 year and 4 months old boar of the improved Leicester breed.

There was an exhibition of seed-wheat, both white and red, the premiums being 50 sovereigns for the best of both varieties. The judges selected for trial Colonel Le Contour's Belle-vue Talavera, and Mr. J. E. Drewitt's improved Chidham wheat, as the best samples of white wheat; but did not consider the samples of red wheat offered, worthy of recommendation for competition; the prize will be awarded at the general meeting, in December 1811.

REMARKS BY THE REPORTER.

In Class 1, for short horned cattle, there was great competition.

In Classes 2 and 3, for Herefords and Devons, the show was very indifferent. The great distance at which the show has this year been held from the counties in which these breeds prevail, accounts, in our opinion, for the want of competition in these classes.

In Class 4, for Leicester sheep, there was an excellent show.

In Class 7, for South-downs, there was also great competition, and those of the Duke of Richmond, Messrs. James Webb, G. Anthon, Chas. Luger, and Oxman, did great credit to their breeders.

In Class 8, there was a very fair show of long-woolled sheep, in which Mr. C. Large stands pre-eminent, and carried off the best prizes.

Amongst the pigs, those which attracted the greatest attention were exhibited by Mr. Eaton of Deddington.

The show of horses was also very excellent, particularly in Suffolks.

The speeches which followed the dinner must have had an elevating effect on an assemblage of 3000 persons, all wound up to a pitch of enthusiasm; and, spite of the danger of wearying our readers with the detail, we cannot forego the pleasure of laying before them at least, which was given by the Chairman, with the response, by our ambassador, Mr. Stevenson, who was present upon the occasion.

The noble President in proposing the next toast, which was the health of a distinguished individual present, the Hon. A. Stevenson, Minister of the United States, an honorary member of the Society, said, that he would know the farmers of England, and that they would all warrant him in saying, they wished, one and all, for peace and tranquillity; peace at home and abroad was what they wished, what they prayed

for; they did not wish to see other nations laid waste that they might be prosperous, nor was it their interest or their desire, that other people's farms should be destroyed, their barns burnt, and their towns and villages plundered; and those who wish for the blessing of peace, we are happy to meet half way, and in this spirit do we meet the good wishes of the American people, whose representative at the court of our sovereign, did them in the honor of being present on that occasion. The distinguished individual to whom he alluded, was one of that great nation, which had sprung from ourselves, and he (the President) in the name of the farmers of England, wished it every prosperity, and that it might long continue in peace with this country cultivating with her those arts and sciences, which tend to better the condition of the human race, and add to its happiness.

With respect to the hon. gentleman (Mr. Stevenson) he was a tried friend to agriculture: he felt interested in the improvement of agricultural science in England, and they would that the same good should extend to America; for the object was not only the agriculture of the land we live in, but the agriculture of the whole world!

Mr. Stevenson was most loudly cheered when he presented himself to the meeting.

“It would,” he said “be unworthy affectation, if he did not say that he felt proud at the manner in which his name had been received by that, the most remarkable and imposing scene he had ever witnessed in the course of his life—not a very short one.—He must return his thanks to the noble President for the manner in which his name had been given, but he feared he should not be able to do justice to his feelings on this occasion. The kind and hospitable reception which had been given to him, and the very gratifying manner in which his name had been associated with that of their two countries, demanded his acknowledgments; he received it with pride and satisfaction. Deeply sensible, however, as he was of the honor done him, he should not inadequately convey his feelings, if he confined himself to an expression of his individual feeling. In relation to himself personally, it was but a matter of little importance; but in another sense looking to such an assemblage as that, representing not only the great agricultural interest of England, but of the United Kingdom, the kind and liberal sentiment expressed would do good, and strengthen the relations of amity and peace which existed between the two countries. He, therefore, thanked them in the name of his country, and at the same time assured that nothing was more acceptable to the people of the United States, than sentiments like those that had been so kindly expressed. Their noble President had been pleased to express a wish, in allusion to the regulations between the two countries, that the present relations of peace and concord might long continue, for the benefit of both—he need hardly say he cordially he united in this wish! This was, fortunately for mankind, not an age of war; the time had long since passed, when hostility and war was regarded as the natural state of man, and peace only a dangerous and difficult experiment. The soldier and the sword, he thanked God, were no longer the only security for nations—the schoolmaster, and not the warrior, was abroad! Moral power was taking the place of physical force, and the rulers of the world would learn, if they had not already, that they must look for security to their thrones, to moral, and not physical power, and to the virtue and intelligence of their people. In this enlightened age, when the love of peace, and knowledge of Christianity, were ever spreading the earth, was there one Briton or American—one wise or good man—who would not look upon a war between two such countries as England and America, as one of the greatest calamities that could befall mankind! A war against interest, kindred language, and religion, and for what?—not for principle—not for national honor; not for conquest; to a war to settle the geographical lines of a treaty-boundary—the subject legitimately of negotiation at peaceable adjustment.

But England and America, he said, were two wits to enter into any such war. Neither, he was sure, would feel itself called upon, in vindication of its honor or in defence of its rights, to embark in war—the security for peace is in the wisdom and prudence and foresight of the rulers of the two countries, and in the virtues and intelligence of their people. Their noble Chairman had done him no more than justice in supposing he had done every thing in his power, both officially and individually, to cherish and invigorate the friendly relations of their two countries, upon the preservation of which, he believed, the prosperity of both nations essentially depended; he therefore only spoke

* Already the Society, in the second year only of its existence, had received the names of 2000 members; the first meeting of the kind, perhaps ever held, will take place on the 6th of the present year, and it is 3000 names will be on the list, as subscribers.

ments of his own country, when he assured that its people and government desired peace—*perpetual peace*, with all nations, but especially, understanding with Great Britain, upon terms suitable with the rights and honor of both. He is in having it in his power to attend on the precaution; for besides the opportunity it afforded a witness proceeding so congenial to his feelings enabled him to express in person his sense of honor which the society had done him, in electing one of its honorary members. In such an assembly it would be needless to expatiate on the subject and its claims to support; he, however, disposition to throw out one or two suggestions which might be worthy of consideration. All confined in ascribing to agriculture a high place in the list of individual and national interests, but yet he thought they did not give the importance it merited, which it justly aspired—in other words that too supposed the object of agriculture was alone repose of subsistence. Now, a more fallacious could not obtain, than that the responsibilities agriculture stopped at the *production of food for*—The duties of agriculture were like those of others, they spread beyond the circle of providing means of subsistence, into a wide expanse created obligations arising out of a state of society, were connected with all the great national interests. Hence the support of government, the encouragement of commerce, the basis of trade, the subsistence of the learned professions, depend upon the industry and interests of agriculture: it was the source which not only all others derive subsistence, but vitality. As an object of universal benefit, then, it is entitled to universal patronage. Agriculture had justly been considered national property: the country was one great farm, and the inhabitants a great family, in which however, those who did the least had often the most profit. Now, it were true, as he believed it to be to a certain extent those who were not farmers had still as deep interest as the farmer himself, inasmuch as the class employed in agricultural districts and laborers the first to be subsisted, and that of the other out of the surplus—and, of course, the larger surplus, the greater would be the profit: this was an argument it might be said, but yet he thought the less strong.

all the modes that had been resorted to in aid of culture, the most beneficial were associations of farmer—societies for the collection and diffusion of knowledge, the introduction of useful experiments, the writings of able and distinguished men, and emulation so essential to all improvement. Science was absolutely necessary to modern agriculture, and practice reflected light upon each other. This was the more felt as, of all pursuits, there was no class so wedded to old habits which were so long, as those who cultivate the soil; and this was the case in the new world as well as the old. He felt, therefore, in the giant strides which agriculture was making in every part of the globe, under the aid of practical science: this was one of the benefits which this society would accomplish. Any man doubted the extent to which science benefited agriculture, let him visit England and Ireland. And why was it so? Simply, because it was cultivated upon principles which were true to the test of rapid and severe experiment; agriculture was scientifically and philosophically pursued, and because she had such excellent farmers. If a foreigner wished to know what England must go into the country and mix with her yeomanry. It had been said, he believed of the princes of the reigning family, that the people of England was her yeomanry—he re-echoed sentiment, and he was happy to belong, when he, to that class—not to the proud distinction of an American citizen, but that of being a farmer.

could look upon such an assembly as this feeling himself elevated and gratified? They were all classes united in this great work—the good, the public and the private man; those led high places, mixing with the farmers and laborers of the soil upon perfect equality, and the peace and charity shrouding around a holy calm, mingling alike to the feelings and to the intellect!—upon this society, and its wide-spreading and enlightening purposes, that the eyes of Europe and America were now fixed with a steady gaze, and he thought there would be no disappointment of their hopes! Viewed in relation to their own country, as every motive for supporting it, but wedded to its effects upon other nations—as has justly said—the motive for exertion rose into a

much higher and nobler sentiment; it became then the cause, not of *their country or his*, but that of mankind! And who was so poor or so cold in spirit, as to think only of himself or his country, when the great question was, whether the earth should be inhabited and cultivated by enlightened and virtuous and religious men, or by debased and ignorant human beings and herds of savages? In concluding, the honorable gentlemen said he could only repeat his thanks for the kindness and benevolence, and his best wishes for the success of their association; he trusted that it might fulfill its high purposes, do honor to its founders, and be a benefit mankind throughout the universe."

To Keep Silk Worm Eggs for next Year.

Our experience this year has furnished much valuable information as to the best method of keeping silk worm eggs for hatching at any time next summer, and, as this is the proper season for commencing the process, we will give what we consider the best mode. The eggs should be removed to a cool, dry cellar as soon as they are ripe; that is, as soon as they have changed color, or become of a peculiar blue slate color. If they are on paper or cloth, they may be folded up into a convenient form, and placed in a tin box, with a cover merely sufficiently tight to exclude insects and vermin. They should be examined occasionally during the summer, to see that the papers or cloth do not get mildew or mouldy; if they do, they must be exposed to the wind in the shade for an hour or two, till they become dry, and then replaced. If the eggs have been taken off the papers or cloths, they may be put in the tin box in layers of half an inch with a few folds of blotting paper between them. In January, during cold weather, the box may be removed to the *ice house* or a refrigerator. We prefer a refrigerator, because we can regulate the temperature in it exactly; and if we had no ice house, we would still use the refrigerator for that reason. During the remainder of the winter, the thermometer should be kept in the box among the eggs, that the precise temperature may at all times be observed. From the time that they are put into the ice house till they are wanted for hatching, the temperature should never be allowed to rise above 45°. The eggs will generally bear 50°, without hatching, but 45° is more certain. After the natural season for hatching has arrived—say after the 15th of April in this latitude, any exposure to a higher temperature will tend to the hatching of the eggs, and must be avoided. The eggs we put in our refrigerator last January are yet in perfect condition, and hatch regularly, beginning on the 8th day after exposure. We use from a peck to half a bushel of ice daily, depending upon the warmth of the weather. Half a bushel was abundant during the hottest weather in July.—When the ice is properly applied, the temperature is kept remarkably equal without the slightest difficulty.

The fears that the eggs will be liable to dampness, and consequently ruin, when kept in a refrigerator at a low temperature, are groundless. At a temperature of 45°, no dampness can exist in the refrigerator, as, if there be any vapour evolved from the ice, it is immediately condensed by the low temperature.—In illustration of this fact, we will mention that we had a quantity of eggs that had accidentally got wet; they were fully soaking in water. We spread them on a quire of paper in the refrigerator, and in a few hours they were as dry as powder, and so remained.—Mould and mildew cannot form in a temperature of 45°. Where the ice house is not good, and consequently the air in it is filled with dampness or vapour, a refrigerator should be used.

Nothing is easier than the construction of a refrigerator. A large square box may be made of common plank, and another twelve inches smaller each way.—Put pulverized charcoal in the bottom of the large box, six inches deep; set the small box on it at equal distances from each side and end; then fill in all round between the small box and the large one with pulverized charcoal to the top of the small box. Then make a box six inches deep, and large enough to fit exactly in the large box; fill this with the powdered charcoal; this latter box will answer the purpose of a cover for the refrigerator. The inner box should be large enough to hold all the eggs required to be kept, and a tin bucket, or other metal vessel, that will hold half a bushel of ice; for the ice must not be put upon the floor of the box, as it will wet the eggs as it melts.—The ice vessels must be kept constantly supplied with ice. The box cover may have a couple of handles, to enable the attendant to move it conveniently.—The cover will not shut so closely as to exclude a rat entirely, nor so as to injure the eggs. It will naturally be supposed that there will be danger of warming the eggs by frequently opening the box; but this is a mis-

taken notion, as unless it be kept open too long—say more than a minute or two each time, no warm air can get into it; because the cold air in the box being heavier than the external warm air, will necessarily remain in the box, nor can warm air descend into it, being too light to displace it. This refrigerator may be kept in any part of the house, the cooler its situation, the less ice it will require; but half a bushel of ice will keep it at the proper temperature for twenty-four hours, in any situation not exposed to the sun or to fire heat.—G. B. S.—*Jour. Amr. Silk Society.*

From the Essex Register.

Profit of Bee Keeping.

We observed in the Mercantile Journal last week, an article on this subject, which deserves consideration; and as the following facts, within our own knowledge, confirm the position assumed therein, they may not be uninteresting.

Col. H. K. Oliver of this city, has for several years paid great attention to the management of bees; and after a series of experiments and unwarmed diligence, he has now reached a wonderful degree of perfection. His apiantries, we may safely say, are the finest in the State, and we unhesitatingly challenge any individual to exhibit a better managed or more productive.—Col. O. uses the non-swarming collateral hive, which he thinks better adapted to cities and populous places than any other. We had the pleasure of witnessing the labor of his busy operatives last week, and can assure our readers that it is a sight well worth seeing. The hives are so constructed that one can observe without danger all the operations of these industrious laborers, and draw them from many a useful lesson.

Col. Oliver has two apiantries, one containing eight, and the other partly stocked to contain seven hives. The hives consist of one central and two collateral boxes—the honey being drawn only from collaterals, leaving that in the central box where the bees are preserved during the cold weather, as stock for their winter supply. Some of them have, in addition to the two collaterals, a top box to contain glasses to be filled by the bees. During the present year, ten hives have yielded an average of 50 lbs. each, making 500 lbs. of honey, which sells readily here at 25 cents per pound. Some of the hives yield as high as 80 lbs. each. The honey is the whitest, clearest, purest, we have ever seen, and fresh from the comb is truly delicious.

As to the profit of keeping bees, there cannot be a question, the Col. thinks, if they are rightly managed. But like all other stock, they need care and attention, and must not, to be made profitable, be kept in the usual rough boxes of the farmers, nor left to the tender mercies of the north. By the common method, in order to get the honey the bees are all killed;—but by the improved method they are all saved alive, and are deprived of only the excess of honey over what is necessary for the winter's consumption.

Our townsmen, Messrs. Holman and Pappen, have apiantries also, constructed on the same bee-preserving principle, and equally profitable.

The following is the article from the Journal:

PROFIT OF BEE KEEPING.—We applaud our farmers, and especially the small ones, and their wives and children, and divers people, so situated that they might as well as not have a hand in the business, have misused it not a little by underrating bees as an article of mere profit. We know nothing against Mr. Wicke's position that they may be cultivated in such a manner as to render them more profitable to their owners than any branch of agriculture, in proportion to the capital invested in their stock. They are not taxable property, neither does it require a large land investment, nor fences, nor does it require the owner to labor through the summer to support them through the winter. Care is indeed necessary, but a child or supernumerary person can perform most of the duties that are necessary. The colonies must be kept away from the immediate vicinity of the hay, and all other annoyances removed, &c. It is added, truly, that the management of bees is a delightful employment, and may be pursued with the best success in cities and villages, as well as towns and country. It is a source of great amusement as well as comfort and profit. They collect honey and bread from most kinds of forest trees, as well as garden flowers, orchards, forests, and trees—all contribute to their wants, and their owner is gratified with a taste of the whole. Sweet clover, which is especially mentioned as easily cultivated by drills in a garden, and is one of the finest and richest flowers in the world, from which the honey bee can extract its food.

Pears.

Two years ago last spring, we had a considerable number of pear grafts,—from Robert Manning of Salem in Massachusetts (perhaps the best pomologist in the United States),—set on large stocks; and this season four of those sorts have fruited. The *Julienne* has borne plentifully, and the pears are now ripe (9 mo. 1.) We are rather disappointed however, in regard to their quality—they have not much flavor; but we know that some pears are fine in some seasons, and indifferent in others; and on turning to the Magazine of Horticulture, we find the following note by J. M. Ives of Salem: "*Julienne*. In 1838, a small crop, and good. In 1839, a large crop, and worthless." Was this latter result in consequence of the tree having more fruit than it could nourish and mature? And if so will not this sort become more worthless as the tree becomes older?

The character of this pear however, stands high. Kenrick says, "This is one of the most beautiful and valuable fruits of its season, and deserving of extensive cultivation." R. Manning several years ago called it "a fine pear;" and lately referring to the crop of last season, he said it was "fair and good." So we will hope to be more successful another year.

This pear is later than one that we have known as Bohlen's which it greatly resembles; but two grafts from the same tree often vary a week or more in the time of ripening when set on different stocks. Our Bohlen pears this season, however, though from a tree just recovering from disease, were superior to the *Julienne*, and more than a fortnight earlier.

Kenrick gives the Bloodgood pear of New York as a synonym, but this must be a mistake, as R. Manning sent grafts under the name of Bloodgood no longer ago than last winter, which are now growing in our nursery; and it is to be presumed that he would not send the same pear under two different names. Besides he described the Bloodgood as of "large size" ripening in "August;" but the *Julienne* as a small pear ripening in "September."

On another of those grafts, the *Johannot* pear is ripening. Prince describes its *shape and color*, but says nothing of its *flavor*. Kenrick calls it "good;" and Manning "first rate,"—in which opinion several of our family unite.

One of the two remaining sorts that have come so soon into bearing, is the *Cushing*; and we mention our success for the encouragement of horticulturists. But on the other hand, fifteen years ago, we grafted the *Berganot* pear, and from two trees which have now become large, we have never had six cents worth of fruit. This season there is just about enough on the tree—plenty without crowding; and an amateur well acquainted with this variety which he considers very fine,—assures us that the lost time will now be made up.

The superior excellence of "the *September* pear," is admitted by those who are fond of sweet fruit; but the name is without doubt, local. From its great diversity of shape, it may be difficult to give a description adapted to all its variations in different climates; but from all the information we have been able to collect, it appears to be the *Summer Bon Chretien*.

Respecting this pear, we learn from the Pomological Magazine that "its origin is lost in the darkness of antiquity." Some have conjectured it was more than three hundred years old, "probably much higher;" but "it is quite certain that it has found a place in every work of consequence for the last one hundred and fifty years.—It has long been cultivated all over Europe for the sake of the size and the delicious flavor of its fruit;" and "it is known by a great num-

ber of names.—In Vienna, it is known by that of *Plutzerbirne*, from its resemblance in form to a wine flask."

Presuming that our pear is identical with the *Summer Bon Chretien*, we would remark that in some particulars it has not been fully described; and we proceed to will mention them:

1. A broad channel often occurs on fine specimens, as if the sliding pressure of one's finger had pushed a part of the pulp from the blossom end up one side of the stem; but whether a channel occurs, or not, our well-grown specimens show a deficiency at one side of the blossom, and which corresponds with the projection up the stem.

2. About half way up from the blossom end (sometimes more) there is a sudden contraction in the breadth of this pear so that it is neither pyramidal nor turbinate.

3. The leaf is more smooth and shining than that of any other pear which we have seen; and we have always been able to distinguish this tree solely by its leaf, though it is shaped like an apple tree, broad and spreading.

Stem, varying in length from one and a half to two and a half inches. *Seeds* generally "all abortive."

On young trees, the fruit is commonly fair. On old trees, if *left untrimmed*, it is more knotty, distorted, and smaller,—for the limbs grow very close together. We can give *young* branches to old trees however, by *thinning out*, and *heading down*; and induce them to bear as well as in former seasons. The youth and vigor of the *branch* is the main thing—the *age of the stock* unimportant. Last winter we trimmed our trees, and nearly all the fruit which is well exposed to the light, is fair.

In the vicinity of Boston this pear is of little value on account of its being subject to spots and cracks; and such, we have been informed, is also the case in some parts of Connecticut. These spots appear to be parasitic plants (*Lichen?*) which consume the juices and prevent the growth of those parts of the pear which they cover—the swelling of the other parts causing the cracks. Kenrick, who believed in the doctrine of "worn out varieties," says, "celebrated more for its great age and beauty than any thing else. A poor bearer and neither highly esteemed or recommended. Quintinie, 140 years ago, called it a *bad pear*."

From this style of writing, we should infer that Kenrick had not seen the "Guide to the Orchard and Fruit Garden. In 1831, Lindley described it as "very sweet and excellent;" and afterwards called it "a very excellent old pear," adding "It is rather too tender for an open standard" (in England.) Such also may be the case in the neighborhood of Boston. Either the *soil*, or the *climate*, or the *management* is unsuitable; but in Western New York, it deserves the character of a first rate fruit.

The *Seckel* pear with us, grows on a shrub, and not on a tree if the least height of the latter be taken at eight or ten feet. Its growth is very slow both in the nursery and in the fruit garden. If grafted high from the ground however, it soon comes into bearing and bears exuberantly; so much so indeed that if left to itself, the fruit will not attain half its proper size, and consequently not its full flavor. Last winter we had ours trimmed; and the result will warrant us in strongly recommending this practice to horticulturists.

It would appear from Coxe's description that he had mistaken the *Rousslet de Rheims* for this invaluable pear. The former in our fruit garden is of little value, as it rots as it softens on the tree; but the *Seckel* on the contrary belongs to the class of *Bon Chretiens*—*sound to the core*.

Stevens's Genesee Pear.

We obtained grafts of this fine variety, several ago of James K. Gaernsey of Pittsford; and this season, we have been able, very satisfactorily, to test its value. "I never tasted a better pear," was the exclamation used by several of the jury whom we had summoned on the occasion; and this verdict agrees entirely with our own judgment.

We have not found any description of this fruit; therefore submit the following, which may require modifying when a greater number are examined and compared, for when we thought of making the attempt there was only one left.

Fruit, thick, ovate, swollen at the sides, rather three inches in height, and more than two inches in breadth. *Stem*, thick, an inch long, inserted obliquely in a deep narrow depression. Surface distinctly dotted with light brown, and slightly tinged with red on the sunny side. *Eye*, open, in a moderate and regular depression. *Flesh*, white, melting, and high flavored juice. *Ripens*, the middle of the month.

Prince remarks in his *Pomological Manual* that it should be gathered as soon as the stem will separate with a clean fracture, and ripened in the house; and be eaten as soon as it becomes yellow and mellow it will not keep." Such treatment it receives in our hands.

The New Large White Carrot.

Messrs. Editors—I purchased last spring from the Rochester Seed Store, a paper of the white carrot seed, which I had seen recommended in the catalogue as something new brought over from England by Batcham last fall. I can assure you it exceeded most sanguine expectations, and I believe it will be a great acquisition to our assortment of root crop field culture. I this day pulled one about middle size, and it measured 18 inches in length, and 9 inches in circumference in the middle. It was very tapering; pure white color; flesh very fine and juicy. The land on which they are growing, is a sandy soil, manured last year for potatoes.

Yours, &c., WM. WELLS
Irondequoit, Monroe co., Sept. 1840.

Remarks.—Mr. Geo. Sheffer of Wheatland, brings us some fine specimens of this carrot, a few weeks since. He is highly pleased with them.—Eds.

For the New Genesee Farmer
Crops in South Venice in 1840.

I take my pen to give you a short account of the crops grown in this quarter the past season.

Wheat.—The crop is unusually good; better than has been for many years past. The berry is finer than I think I never saw better. There are however, pieces almost ruined by that fatal weed, the stem of which every farmer in this section has more or less.

Corn, in this section, looks extremely fine, the appearance now of being a very large crop. It was a great deal planted in this quarter, therefore under the present auspices it cannot bring a high price. I have not, since 1834, seen this crop look so fine and so stately as at present; many fields will yield on an average from fifty to sixty bushels per acre.

Peas.—The crop is very good, though not so good as last season. The weather, the greater part of the time, has been too warm for this crop to do well.

Oats.—Almost every field in this vicinity is unusually good; better, by far, than last season, and may be considered as a first rate crop in this section of the country.

Barley.—What little there was sown, is very good. *Potatoes* are very good, though not quite as good as was anticipated a few weeks since; however they will be a pretty fair crop. There were a great many

...nted this season for the purpose of fattening pork, farmers using them instead of corn.

...is good, what little there is; the farmers of late most entirely abandoned growing this crop, as cloth can be purchased a great deal cheaper than and manufacture flax.

...Wheat.—Considerable has been sowed, and has appearance now of being a fair crop, unless injured by the frost.

...Wheat has not done very well here this season, owing no doubt to the excessive hot weather; in some fields look very well; but to take the crop generally, it will be a very poor one this year. ... quarter, for an experiment, have sown the ... winter wheat in the spring; and the result they had first rate spring wheat; better by a con-

...As I have not tried the experiment, I cannot give you a true statement of the time of sowing; but, I should think somewhere about the first or second of March, would be early enough to try the experiment.

...is good, save on wet lands; the rains in the month of May and June, were very injurious to that land. Upon high land I never have known

...I believe, to take the vicinity together, there is more grass cut this season, from the same number of acres, than has been in several years past. ... of all kinds, look fine, and the prospect is of a very great yield. There are however, but few that grow roots very extensively.

...It is not as plenty as the farmers anticipated the trees were in bloom. However, there will be enough for our own consumption. In fact, Sirs, the thing of an earthly nature looks very promising, and ought not to hinder us from enjoying every thing that is conducive to our peace, comfort, and happiness.

Respectfully Yours,

W. S. TUPPER.

...th Venice, Ontario co., N. Y. Sept. 1840.

Cure for Ring Bone.

...The following is the postscript to a communication published in the Standard Grass, which may be found in another issue.

...MRS. EDITORS—For an answer to Mr. Barnett's inquiry for a cure for Ring Bone, I would refer you to the communication of mine in the 5th volume of the Standard. Suffice it to say that I often operated upon horses and colts, and never failed to prevent lameness of Ring Bone, unless the hoof had become so diseased as of itself to make and keep the horse lame.

Yours &c., ZECHARIAH CONE.

...via, September, 1840.

...The following is the communication referred to.

Cure for Ring Bone.

...EDITOR.—Are we not individually called upon, and we become acquainted with any knowledge by a more extended diffusion will promote the best and welfare of those around us, to make it the same to the public?

...I would direct the attention of all gentlemen who are raising horses to that complaint, viz. the ring-bone.

...In the early part of my life paid considerable attention to the raising of horses, but finding them to be so many complaints, and especially that of ring bone, I was much discouraged in the enterprise, and was led to ascertain, if possible, the causes of the complaint, and if any remedy could be found. I obtained all the information that I could obtain from different authors on the subject, and from my own experimental knowledge of the complaint, I was led to conclude that there were various causes for the complaint in colts which are kept confined in a stable, and who are clenched off daily, are more liable to be affected with ring-bones, than those that are kept on the

ground or on floors well littered. Low keeping, by weakening the joints, has a tendency to produce them. In young horses they are generally occasioned by sprains, which are made by being rode or drove too hard, running in the pasture, or leaping fences.

After hearing the above statement as to the causes, the reader may with propriety inquire, what composes the ring-bone, and whence does it originate? In answer to this inquiry—I have found it to be composed of the synovia or juices of the ankle or fetlock joint, which, by some of the forementioned causes, is made to flow or leak from the joint, and is at first collected into a small sack in the back part of the fetlock joint; from thence it is conveyed by two small tubes to each side of the foot, where it gradually forms the callous or ring-bone.

For the last thirty years I have been in the habit of successfully performing an operation, which prevents the ring-bone from increasing in size, and if not lame previous to the operation, the animal never after becomes lame in consequence of the ring-bone; but if lame before the operation is performed, a period of from one to twelve months is required for their recovery, much depending on the length of time which they have been lame.

The operation is performed in the following manner. I first shear off the fetlock, then make an incision through the skin and extract the sack above mentioned, at the same time taking care to destroy the communication from the joint to the ring-bone.

If the aforesaid operation is performed skilfully, the horse is as fit for use in one week as before.

ZECHARIAH CONE.

Hebron, Conn., March 26, 1838.

Remarks.—Dr. Willich says, where the tumefied part is distinctly perceivable round the pastern, without affecting the coffin joint, it is easily cured, but if the swelling be of long continuance, and has become hard, it may require both "blistering and firing," i. e. searing with a hot iron—Extend a mild blister over the cauterized part.—Cultivator.

Another.

MESRS. EDITORS—In answer to the inquiry of Joel P. Burnett, relative to a Ring Bone on his horse, I would reply, that if a Ring Bone is observed in its incipient state, a blister is usually of service; but if of long standing and large, the actual cautery is also necessary. If the disease has proceeded so far as to cause a stiff joint, there is no chance for recovery.

A SUBSCRIBER.

Split Rock, U. C., September, 1840.

Another.

MESRS. THOMAS & BATEHAM—I observed in your last paper an inquiry for a cure for Ring Bone on horses.

- Take one ounce Sweet Oil, One " Oil of Spikes, One " Oil of Stones, One " Oil of Vitriol, One " Aquafortis;

Put the first three into an iron or earthen vessel; then pour the others in slowly, stirring it constantly, (otherwise it will foam over,) until it is well mixed. Rub the composition on the Ring Bone three successive mornings, then omit three, and repeat it three more; so on for three times or nine applications, and it will in most cases effect a cure. The horse should not be used for some time, nor exposed to wet.

The above recipe will also cure spavins and wind-galls.

D. WILSON, P. M.

River Styx, Ohio.

Preserving Winter Apples.

Who believes the secret of preserving winter apples, depends greatly upon doing every thing well, as well as upon the mode.

As preserving them in barrels, is generally found most convenient; a few suggestions under this head may not be unacceptable.

The fruit should remain on the trees as long as safety will permit—generally till near the close of the month—when it should be very carefully picked by hand, by means of convenient ladders, and as carefully laid

in baskets. Rotting generally commences at bruises; great care should therefore be taken that the fruit does not receive the least contusion. They are to be carefully laid in the barrels, very gently shaken down, and when the head is put in, it should press upon them sufficiently to prevent all rattling when the barrels are removed. This pressure never injures them nor causes them to rot, if the barrels are not opened before the apples are needed for use. A layer of straw is found to do more injury than good. The barrels should then be placed on the north side of a building, or the coolest place to be obtained, protected from rain by boards, until the approach of very severe weather, when they are removed to the cellar, where they should remain undisturbed until needed for use. The cooler apples can be kept without freezing, the less liable are they to decay.

Color of Cows—Inquiry.

MESRS. EDITORS—You are probably aware that a deep red color is considered the best for milk cows. Now, do you think that the color has any effect on the quality of cows? A few remarks on this subject by those who can throw any light upon it, may interest more than

ONE OF YOUR READERS.

Warming Houses.

There is much popular ignorance prevailing on the subject of warming houses both among the English and Anglo-Americans. One would have thought that the experiments of such men as Franklin and Rumford would have dispelled the illusions about people being more liable to catch cold when a regular and uniform heat is kept up in their apartments, than when these are traversed by currents from doors, windows, and every crevice, all rushing towards an open fire. But prejudices are hard to be overcome—the more so indeed, the more beneficial their abandonment. If we were readily made harder, and acquired exemption from the complaints so common in our variable climate, during the autumn, winter and spring months, by the common practice of using open fires,—single windows and doors, we might give up the comfort of the opposition plan; but no such good follows our exposure: no frame, however vigorous, is exempt from the results of streams of cold air in our houses.—This is not however, a matter of theory, or to be argued from individual experience.—Notional usage, in the coldest climates in Europe, is decisive on this point.—The Russian Finlanders, and Swedes of all classes, are not ashamed to keep up nearly a summer heat in their houses during the winter months—they have no fears of being called effeminate. On the contrary, allege that in sullying out from their houses into the external frosty air, they are able to bear and even enjoy this kind of exposure, or a bath, the better from their previous warmth—precisely for the same reason that a person with a vigorous circulation of the blood and hot skin, is better enabled to bear the shock of a cold bath. In the opposite circumstances, of immersing in cold air or cold water, when a person is chilly and with pale skin, as when coming out from a cold room and imperfectly clad, he will suffer greatly, and be less able to resist the secondary and morbid effects of cold.—Rumford declares that, notwithstanding his first prejudices against stove heat, he found from an experience of twelve year's residence in Germany, not only that warm rooms were more comfortable in winter, but certainly tended to the preservation of health.—Journal of Health.

Seed of the Wild Rice.—(Zizania aquatica.)

There was considerable inquiry, last spring, in different agricultural papers, for seed of the Wild Rice. We have succeeded in obtaining some of this seed, and shall be happy to distribute it to such friends as desire to experiment with it.

Some sportsmen of this city sent to Canada and obtained several bushels of this seed, to sow on the bays and marshes near Lake Ontario, to raise food for wild ducks and geese, and attract game to this vicinity.

Dialogue between a Father and Son—Influence of the Female Character.

Frank.—Father, have you seen the beautiful rose which has just opened in sister Susan's garden? It is indeed splendid. I don't know how it is, but I am no match to a Susan in gardening; she has the knack of making every thing bloom in which she cultivates; and I have often observed, that if we are planting the cuttings of flowering herbs, and although I might have cut the plant and prepared the cuttings for her, there is not one in five of her's that will die; while out of mine, it is only about one in five that will live. I begin to think there must be some truth in the old-fashioned notion, that when a man is forced, a woman is favored; the finest portion of the clay being selected for this purpose. All that Susan does is done with the fingers, whereas all mine seems done by the rule of thumb.

Father.—There is certainly a difference in the way in which you and Susan do things, but I am by no means mean if I make the comparison to your disadvantage. I confess there is much beauty in that old-fashioned idea which you have mentioned; and with us, who know, and taste, and feel, the value of the female character, 'tis no wonder that it should have some weight; but we are fortunate in this respect, remember.

Frank.—I declare, I fancy that I perceive a difference in the fragrance of sister Susan's flowers, when compared with mine, and certainly they continue longer in bloom.

Father.—That, I dare say, is only a fancy, yet it is a pleasing one, to which I suppose, you have not much objection. The idea, that to the finer mould of the female is to be attributed the power, which they usually possess, of bearing with more fortitude the reverses of fortune, and the bereavements of life, than men, is beautiful and quite poetical; and many are the instances which I have known, where, after sustaining her full share of the trouble and anguish consequent upon such, the wife has been enabled to impart a portion of her mental courage to the support of a husband, bowed to the earth with the weight of his share of affliction. Take a china cup, into which boiling water might be poured, and, immediately after, water, cold as ice, without fear of breaking—so the heart of woman will expand with prosperity and contract with adversity, without bursting; while the man, like a brown-ware mug, is done up in half the time!

Frank.—Well, I never heard any one advocate so well the cause of woman, in my life!

Father.—Ah ha! that reminds me of an occurrence which took place some years ago, and which I must relate to you. I was travelling, by coach, in England, in company with six gentlemen, and a plain, homely woman, about sixty years of age; the subject of conversation amongst the men was the character of the female sex; and, although they agreed that the women were the weaker sex, they dissented in toto to the doctrine of their being the softer. As I always do, vindicated their rights and privileges, and on my remarking that they were feared of the finer class, the old lady, who had long felt intense interest in the conversation, exclaimed, "Well! indeed I never heard any one talk so well in my life! I declare it does me good to hear you, sir!" About the same time, I crossed the channel between Ryde and Portsmouth, in a sailing boat, on a stormy day; the passengers had taken their seats, when a very elegant young man, in the military dress of a foreigner, came on board and enquired, in broken English, if any lady wanted a protector for the passage? The ladies, all but one old fishwife, with a basket of fish for the Portsmouth market, had already been seated with partners, and she being the only unprotected female, he went and took his seat beside her, pulled her cloak about her head and feet, and waited upon her with the greatest assiduity. The old woman did not at first know what to make of it, but after a little, she winked to the rest of the passengers, and quite enjoyed it. The gentleman, seeing them smile, said, "gentlemen, I am a knight of the Prussian order of the North Star; our only bond of union is the protection of woman, at all times and in all places, without regard to age or beauty."

On our arrival at Portsmouth, he offered the old woman his arm, took the basket of fish in the other hand, and stepped gracefully on shore, handed her the fish, made her a bow, and walked on. The old woman could contain no longer, but bursting into a scream of laughter, she declared that it was the funniest joke that she had ever seen or heard of!

I grant that it is not in your power to imitate your sister, in the delicate and gentle way in which she

in perspective and change—raising their drooping heads, and curling them "very prettily," for she, I am sure you will admit, is one of the softer sex. All this reminds me of that beautiful poetic gem, "The Hymn to the Flowers," by Horace Smith, which was published in the Farmer's Column a few months ago; the endearing epithets with which most all the verses commence, are particularly delicate and affecting; and, although I have read and re-read it times innumerable, I still experience new delight on every fresh perusal. You must copy it into your book, and get it by heart, and then you will never be at a loss for a beautiful simile at sight of a beautiful and lovely flower.

Frank.—Oh, I shall never forget that heavenly melody! But, Father, have you not noticed that, next farmer Sykes when we walk, he is always singing? I never heard neighbor Grubb sing or whistle. I think their clay must have been different in its nature at the first, and while one might be likened to the happy soil, the other must be (what is the horror of all good farmers) a wretched soil.

Father.—Ay, Sykes has a soul to feel, as well as a tongue to express, by Lennox's sounds, the language of the heart. I am sure that this love of sacred music might be traced in all that he does—in his ploughing, in his sowing, in his wading, and in his mowing, and especially in the managing of his cattle and horses, to whom he chants his commands, instead of uttering them in that brutal tone and expression in general use amongst farmers; and when we hear the observation, "the farmer's eye makes the horse fat," I cannot but think the farmer's tongue does quite as much in that friendly office. And you must often have observed, when Sykes untied his horses in the stable, for the purpose of harnessing them for their labor, and says, "come n'y beauties," how quickly they turn in their stalls, and stretch out their necks and open their mouths to receive the bit! and I have seen his saddle-horse carry the whip in his mouth and gallop with his master on his back!

Frank.—All this is true—but you have been, all this while, drawing your own, as well as farmer Sykes's portrait, you know.

Father.—No one would calculate the advantages arising from a mild and gentle spirit wherever cattle, sheep, and other animals are kept; but we might see this exemplified in the opposite character of those around us; for we know that farmer Blandin's two dogs, and his two more savage sons, are the terror of the neighborhood, while his poor animals are worried almost to death by incessant noise and driving. His dairy is ruined by such means, for his cows are brought up to be milked on the gallop, and their return to pasture is a perfect *coe hunt!* while the bloody curs of his sheep and hogs show that the hunts are often *in at the death*. Now, they complain that their milk will not keep, and it is notorious that they make the worst butter in the neighborhood; and no wonder, for their cows are always in terror and dismay.

Frank.—Yes, and I cannot help contrasting all this with the quietness and docility of our animals, especially when I see them standing in the yard so peacefully, chewing the cud, and, upon being spoken to, removing the right foot so carefully, to give room for the girl to place the pail for milking, and especially, when she goes to milk Flora, the cow which you purchased of Blandin, who, even yet, will not stand quietly until the girl commences her song, which she continues during the whole operation; after which the animal looks for the potato or bit of salt, or some other little remembrance, which ensures her obedience for the next milking. But there is one thing which I have observed—they all move much faster and walk quicker in the morning than in the evening, and seem brighter and more cheerful; and on their return to pasture, they will often set off on the canter in the morning, while in the evening all is still and solemn, with a seriousness which is very striking—now, have you never observed this?

Father.—I have; and, in connexion with this, it is a remarkable fact, which you might have observed, but which I have never seen noticed in books—you may remember that we said "the morning is the time for observation, the evening for reflection."

Frank.—Yes, I shall never forget that, for I am reminded of the difference; as well as of the aptness of the observation, every morning and every evening.

Father.—The act of *observation* draws forward the attention—that of *reflection* directs it backward, or to the consideration of what is past. Do you understand the natural distinction between the two states of mind?

Frank.—Perfectly; no one walks in a church yard *in the morning*; the *evening* is the time for reflection upon the shortness and uncertainty of life.

Father.—Good. The fact which I allude to is the birds which sing in the early morning, do so in major or sprightly key; while those which sing in the evening and during the night, have voices in minor, or key of pensive-ness. The English thrush and skylark, the goldfinch and linnet, are of the morning class—the black-bird or ouzel, the nightingale and red-breast, and several others, are those of evening; the one is *obscurative*, the other is *reflected* personified.

Frank.—That is extremely curious; and it is really so, as I have oft remarked, but without making the application, and the most doleful sound, to be heard only at night, is the cry of the owl!

Father.—So you see the truth of the remark, "farmers are, of all others, the most favorably situated for observation and reflection;" and if they are least enlightened class of the community, it is not want of opportunity to accumulate stores of instruction, of the richest variety. Now, let us close the Dialogues.

Frank.—Oh! but let it be with that sweet addition to sacred music, which farmer Sykes repeated to us the other evening.

ODE TO SACRED MUSIC.

Queen of every moving measure,
Sweetest source of pure pleasure,
Music—why thy power employ,
Only for the sake of joy!
Only for the smiling zest,
At nuptial or at nuptial feast?
Rather thy lenient measure pour
On those whom secret griefs devour;
Bid be still the bleeding heart
Of those whom death or absence part:
And with some softly-breathing air,
Smooth the brow of dumb despair!

Frank.—But here is another *close*, which must be omitted, it is so very applicable to the subject of conversation.

Contemplate, when the sun declines,
Thy death, with sleep, reflection;
And when again, he rising shines,
Thy day of resurrection!

Frank.—And that, again, reminds me of the beautiful lines of Mrs. Barbauld, and which I so often hear you repeat.

Life, we've been long together,
In pleasant and in cloudy weather;
'Tis hard to part, when friends are dear—
Perhaps 'twill cause a sigh, a tear—
Then stead away—give little warning,
Choose you our own time—
Say not "good night,"
But in some brighter clime,
Wish me "good morning!"

END OF THE DIALOGUES.

The Nobility of Labor.

BY O. DEWEY.

So material do I deem this policy—the true nobility of labor I mean—that I would dwell on it a moment longer, and in a larger view. Why then, in the scale of things, is labor ordained for us? Each had it so pleased the Great Ordainer, might it been dispensed with. The world itself might have been a mighty machine for producing all that wants.

The motion of the globe upon its axis might have been going forward; without man's aid, houses might have risen like an exhalation.

With the proud sword
Of dulcet sphonophones and voices sound
Built like a temple!

gorgeous furniture might have been placed in the and soft couches and luxuriant banquetts, spread hands music; and man, clad with fabrics of navy weaving, rather imperial purple might have been to disport himself in those Elysian palaces: "Fortunate had been the scene ordained for us in his life!" But where then, tell me, had been his energy, perseverance, patience, heroism?

Cut off labor with one blow from the world, mankind had sunk to a crowd of Asiatic voluptuaries. No, it had not been fortunate. Better that he be given to man as a dark mass, whereupon to lie. Better that the rude and unsightly materials be piled in the ore bed and in the forest, for him to fashion into splendor and beauty. Better, I say; not because that splendor and beauty, but because the act creates them is better than the things themselves; because

on is nobler than enjoyment: because the laborer reaps and more worthy of honor than the idler. I call upon those whom I address, to stand up for nobility of labor. It is Heaven's great ordinance human improvement. Let not the great ordinance broken down.

What do I say? It is broken down, and it has been broken down for ages. Let it then be built up again here, if any where, on these shores of a new world, a new civilization. But how, it may be asked, is broken down? Do not men toil, it may be said? They do indeed toil; but they too generally do it because they must.

Many submit to it as, in some sort, a degrading necessity, and they desire nothing on earth so much as to escape from it. They tell the great law of labor the letter, but break it in the spirit. To some field labor, mental or manual, every idler should hasten a chosen, covered field of improvement.

But so he is not compelled to do under our imperfect civilization. On the contrary he sits down, and folds his hands and blesses himself in idleness. This way of thinking is the heritage of the abused and unjust social system, under which serfs labored and gentlemen spent their lives in fighting and feasting. It is the result of that opprobrium of toil we have done away.

Asbamed to toil art thou? Ashamed of thy dingy workshop and dust labor field; of thy hard hand scarred with service, more honorable than that of war; of thy soiled and weather stained garment, on which modern nature has embordered mist, sun and rain, fire and storm,—her own heraldic honors! Ashamed of these tokens and titles, and envious of the flaunting robes of imbecile idleness and vanity? It is a treason to nature—it is impiety to heaven—it is breaking Heaven's great ordinance. Toil, I repeat, toil, either the brain, of the heart, of the hand—it is the only true manhood, the only true nobility.

Making Augur Holes with a Gimlet.

"My boy what are you doing there with that gimlet?" said I the other morning to a flaxen haired urchin, who was laboring away with all his might at a hole of board before him. "Trying to make an augur hole!" was his reply, without raising his eyes or pausing his operations.

"Precisely the business of at least two-thirds of the world, in this blessed year of our Lord 1840, is thusing augur holes with a gimlet;" I said to myself, and walked musingly onward.

Here is young A. who has just escaped from the k's desk behind the counter. He sports his muskiness, wears his hair long; has acquired the power of being shaved; carries a rattan; drinks champagne when he can command an X to purchase a bottle, and a friend to a dinner; talks large of the price current, fall of western stocks, and profits of banking; sits in his boots two inches taller than Astor or Ap- ton; and speaks of foreign exchanges as would hehild or Biddle. He thinks he is a great man, and in all others know he is only making augur holes with a gimlet.

Mr. B. is a rabid politician. He has labored hard at caucuses, at ward and town meetings, has talked of the people till the words flow parrot like from his lips, and has done a full share of the dirty work of party years. Office has been the lure held out to lead him onwards, and which has made him neglect his dress, spend his time in hunting up recruits, drill the refractory, and qualifying himself for barn argument and stump oratory. He can settle the ire of the nation in a trice; diplomacy has no intricacies for him; he has shaken hands with the president, and is a great man. He will soon be used up, cast aside; and will then see, as others now do, he is chasing a jack o'lantern, that he is making augur holes with a gimlet.

Here is Miss C. who is really a pretty girl, and who might become a woman a man of sense would be proud of. Now, she apes the *ton* in all things; reads the latest novels, goes to the opera, admires Celeste's singing, and has nearly ceased to blush at the most indecent nudity, lounges on sofas, glories in her illness, tips her bed till noon, coquets with male animals as if she were a cat, imagines that she is a belle, forgets that her father was a cooper, lapses of high life, and plebeian presumption, and is in a fair way to ruin herself. All this comes of her belief that an augur hole can be made by a gimlet.

Mr. D., whom I have just passed, may be put down as a distinguished professor of the gimlet. He was a farmer. His father left him a fine farm free of incumbrance; but speculation became rife, fortunes were made in a twinkling, and D. fancied "one thing could be done as well as another." So he sold his

farm, and bought wild lands in the prairies, and corner lots in lithographed cities; and began to dream of wealth worthy of "golden Ind." Work he could not; it had suddenly become too degrading. Who could think of tilling or being contented with a hundred acres of land, when thousands of acres in the broad west were waiting for occupants or owners. D. was not the man to do it, and he opted to the extent of his means. At last the land bubble broke; lithographed cities were discovered to be mere boggs; and prairie farms, though the basis of exhaustive wealth, worthless, unless rendered productive by labor. But D.'s beautiful farm is gone, and as he is now preparing on compulsion to become a pioneer in the west, he feels that it is difficult making augur holes with a gimlet.

Mr. E. is the representative of quite a class. He had his attention awakened to the subject of religion, and obtained new views of its importance and his own obligations. Believing, what cannot be disputed, that love to God and good will to man, is the only true source of happiness, and feeling, as every benevolent mind must, a desire for the welfare of his race, he felt himself called to declare these truths to the world; and forsaking his lapstone, his anvil, or his plough, became without delay an expounder of the scriptures, a self-delegated instructor of mankind.—He forgot that the age of miracles had ceased; and that the ability to teach must now be acquired by the slow but necessary process of human learning. He begins to have misgivings that he has mistaken his call; and will probably discover, when too late to rectify the error, that he has spent the best half of his life in trying to make augur holes with a gimlet. OBSERVER.—*Atb. Cultivator.*

Popular Errors.

Messrs. Editors.—On the 81st page of the current volume of the Cultivator, I have noticed a few of the popular or common errors, and intimated that I might possibly recur to the subject at some other time. The theme is a fruitful one, and might be made to embrace a variety of topics. I propose, however, to touch only those that are brought to bear directly or indirectly on agriculture; and first, *farming in the moon.*

The moon has given rise to abundance of superstitious observances, and from the very earliest age, has been supposed to exercise a great influence over the earth and men. Many of these superstitions have been exploded, while others still retain no inconsiderable hold on the public mind, and are the pregnant source of error. On no point is this more perceptible than in that of farming. That the moon can produce any susceptible influence on crops, or deserve the slightest regard in their sowing or planting, is a notion belonging to the same ages as astrology and witchcraft; and like these beliefs, should ere this have ceased to exist. The celebrated Arrago collected from various sources all the well authenticated facts relating to the influence of the moon on agriculture and the weather, and came to the conclusion, "that there was no reason whatever to confine the common notion that changes of weather attended changes of the moon, or that this luminary has any perceptible effect, or is in the least worthy of notice in conducting the processes of agriculture." Some of the old superstitions or notions on this subject, may, however, be worthy of notice here.

Tusser says, in his "500 points of Husbandry,"—
 "Sow peason and Beans in the wane of the moon,
 Who soweth them sooner, he soweth too soon;
 That they with the planet may rise,
 And flourish with bearing most plentiful wise."

But though such was the general feeling, there were some enlightened and intelligent enough to perceive the absurdity of such notions, and expose these errors. Thus Werenfels in 1748, in an Essay on Superstition, says:—

"The superstitious man will not commit his seed to the earth when the soil, but when the moon re- quires it. He will not have his hair cut when the moon is in Leo, lest his locks should stare like a lion's mane; or when in Aries, lest they should curl like a ram's horn."

I would say to the farmer, don't trouble yourself about the moon. See that your land is in fine tilth, well manured and drained; your seed fresh, and free from foul matters; and when you are ready, sow, without consulting the moon or the almanac. If all is right in other respects, the moon, no matter what may be its position, will not hurt you or your crop; and if your land is but half prepared or tilled, rely on

the moon as much as you please, and you have no right to expect a crop.

Another common error is that relating to the "signs." Somebody among the ancients, for convenience sake, divided the stars into constellations, named from their fanciful resemblance to the objects, Leo, Virgo, Aquila, Pisces, Taurus, Sagittarius, &c. &c. In its annual revolution, the sun passes through a dozen of these constellations or signs of the zodiac; and by degrees these signs were supposed to exert a magical influence on the several parts of the human body; and we all remember some of our old ailments, the man mounted on the globe in a state of nudity, that the place and effect of the signs could not be mistaken. This popular error is a fancied man- kind wonderfully, and though common sense has in most cases displaced the *manic signs* still retain their ascendancy over the conduct of multitudes.

There are many men in the present age, so far behind the times, that if they have a tooth to pull, a vein to open, a peg or nail to re-entrate, a patch of distils to move, a bunch of white birches or scrub-oaks to cut down, or a dose of physic to swallow, the chapter of signs must be consulted, and the re-connection with the body, or the plant, ascertained before any thing can be done. The full believer in signs, would as soon swallow a dose of poison as physic, when the sign was in Taurus, as that animal chews the cud; and in that state of the signs, the enthusiastic would assuredly prove an emetic, or in other words, follow the course of the cud. Woods or trees must be cut when the sign is in the heart, that the whole may perish together; for if the sign was in Pisces, or the fact, we suppose when cut down only the extremities of the plant could be prevented to perish; and we be to the unlucky cut-off cold that happened to undergo emanation when the sign indicated the forbidden region; his fate was sealed beyond the possibility of mistake. If you see at the present time, a man's knees buried in brass, his fields overrun with bushes and thistles; half a dozen of uncurated pigs and colts running about, as if to perpetrate, by m and in breeding, all the defects of their races; and his orchards and woodlands neither trimmed or pruned, that man may be set down as a believer in signs, one who governs his farming by the moon, and who will in all probability, reap such a harvest, and experience such results, as so irrational and unphilosophical a course indicates.—*Atb. Cultivator.* M. S. D.

Woman.

The right education of this sex is of the utmost importance to human life. There is nothing that is more desirable for the common good of all the world, since, as mothers and mistresses of families, they have for some time the care of the education of their children of both sexes, they are intrusted with that which is of the greatest consequence to human life.

As the health and strength, or weakness of our bodies, is very much owing to their methods of treating us when we were young; so the soundness or folly of our minds is not less owing to their first tenets and ways of thinking, which we eagerly received from the love, tenderness, authority and constant conversation of our mothers.

As we call our first language our mother tongue, so we may as justly call our first tenets mother-tongue; and perhaps it may be found more easy, to forget the language than to put entirely with those tempers we learned in the nursery.

It is therefore to be lamented that the sex on whom so much depends, who have the first forming of our bodies and minds, are not only educated in pride, but in the silliest and most contemptible part of it.

Girls are indulged in great vanity, and mankind seem to consider them in no other view than as so many painted idols, who are to allure and gratify their passions.—*Lady's Book.*

Remedy for Smut in Wheat.—About the time of sowing, the wheat intended for seed should first be thoroughly washed, and then rolled in lime. As there is a liability of its heating after it is rolled, it should be spread over a surface large enough to give the air free access to the grain, which will prevent such a result. It should be remembered that when the wheat is once smutted, it is apt to be infected with smut in after crops; consequently the process I have mentioned, ought to be pursued for three or four years in succession. John McConnell, Esq., of Chemung co., N. Y., has adopted the above remedy with entire success, for several years; and will be happy to give any information on the subject, if called upon at his farm, near Fairport, Chemung co., New York.—*American Farmers' Companion* W.

From the Knickerbocker, for September.

MT. HOPE CEMETERY, ROCHESTER.

BY MRS. E. C. STEEDMAN.

Come hither, ye who fear the grave, and call it lone and drear Who deem the burial-place a spot to waken grief and fear; Oh! come and climb with me this mount, where sleep the silent dead, And through these winding gravel walks, with noiseless foot-step tread. Sloop down and pluck the fragrant bud, just opening fresh above The peaceful bed, where slumbers one who died in youth and love; Smell the pure air, so redolent with breath of summer flowers, And take this sprig of evergreen, a pledge for future hours. See yonder river sparkling through the foliage of the grove, How gracefully its course doth lend—how still its waters move! Sit 'neath the branches of this tree, which spread their grateful shade, To screen a spot for musing thought, or holy converse made. Look round this garden of the dead, where creep green myrtle vines, Where "hoop" surrounds the sleeper's home, and scented sweet-brier twines; Where lowly vires open to heaven their tiny eyes of blue, Filled oft at morn with glittering tears, the drop of early dew. And now bend upward still your steps, to gain the highest peak, And let your eyes the view beneath, and distant prospect seek; O, beautiful! thrice beautiful!—there blended hill and dale, And here the lofty mansion, with cottage of the vale! The city spires, which look to Heaven, in whose high cause they stand, As guides to point the pilgrim's eye toward the promised land; The distant villages that speck with white the wavy green, And farther still, the deep blue lake, with many a sail is seen. Des'nd again, and pause beside this vine-encircled tomb, And tell me, is there aught around to fill the heart with gloom? List to the feathered songsters' notes, that warble from the trees, And hear the music soft that steals upon the whispering breeze! Oh! say, do not fair Nature's tones awake the soul to bliss? And does not thought ascend to heaven from such a spot as this? And e'en the grave, doth not its voice, amid such flowery ground, Say to the weary sons of earth, "Here sweet repose is found?" Mount Hope! thy consecrated walks I never more may tread, And learn to die, by counting here the lessons of the dead; Yet sweet 'twould be to "rest my flesh in hope" beneath thy soil, Till the last trump should bid it rise, to see a Father, God!

Hens' Eggs.

I notice in the Farmers' Cabinet for 4th mo. last, p. 265, an inquiry as to the truth of the assertion, that hen's eggs which are round produce female chickens, and those which are long or pointed, produce males.

When a boy, I was in a situation to be able to indulge my fondness for fowls, and often raised chickens;—without ever having heard of the above facts, I discovered that the eggs which approached the nearest to roundness always produced females, and those which were pointed at one end always produced males—I acted accordingly, and always succeeded in obtaining females or males, according as I wished.

After an lapse of a number of years, being in Philadelphia market, I happened to mention the fact to one who raised chickens for sale, and who preferred the males, because they grew larger—the information was received with some surprise; but I advised the person to try it, and afterwards was informed of the entire success of the experiment, all males being produced by selecting the long or pointed eggs.

I since find the fact was mentioned by a writer over 2000 years ago.—Farmers' Cabinet. I. H.

Farmers' Holidays, Fairs, &c.

We give notice of quite a number of Agricultural Meetings and Fairs, to be held this month; and there are many at a distance, of which we have not received

notice. We wish all of our readers may have an opportunity of attending one or more of these fairs. They are calculated to promote the best interests of society in general, and of farmers in particular; and therefore all should co-operate, and lend their aid and influence to sustain these organizations. These meetings afford an opportunity for a friendly interchange of feelings and sympathies, so desirable among all classes, but so much neglected among farmers. They should have, at least once a year, a general jubilee, where they can all meet as brothers and friends, engaged in the most noble and important of all occupations—where they can come together and compare views; rejoice together over present attainments, and devise means for future advancements. We say then come, one and all, with your families and friends, and bring your choicest animals and productions, not forgetting the ornamental as well as the more strictly useful—and if you are not delighted and well rewarded for your time and trouble, we shall be sadly mistaken.

New Arrangement.

The subscriber is happy to inform his friends, and the readers of the New Genesee Farmer, that he has taken into copartnership, Mr. CHARLES F. CROSMAN, in the business of the Rochester Seed Store, and the publication of this paper. Mr. C. has long been very extensively and favorably known as the seedsman and travelling agent for the Society of Shakers at New Lebanon. He has now dissolved all connection with that society, and will exert his talents and influence, for the good of this establishment. This arrangement cannot fail to be highly gratifying to our mutual friends, and the readers of this paper; and it will relieve the concern from the embarrassment occasioned by the death of E. F. MARSHALL.

M. B. BATEHAM.

Address BATEHAM & CROSMAN.

Rochester, October 1st, 1840.

COPARTNERSHIP NOTICE.

THE Subscribers have this day entered into an agreement of Copartnership in the business of the Rochester Seed Store and publication of the New Genesee Farmer. All debts due to, or from the concern, previous to this date, will be settled by and with M. B. Bateham. The business will hereafter be done in the name of BATEHAM & CROSMAN. M. B. BATEHAM, C. F. CROSMAN.

Rochester, Oct. 1, 1840.

TUSCANY SEED WHEAT.

COL. W. T. CUYLER of Moscow has left for sale at the Rochester Seed Store, a quantity of his Tuscany wheat (mentioned in No. 7, page 95, of this paper.) This wheat is earlier and more productive than any common variety, and the berry is very large and fine. All who wish to obtain a superior article should call and examine this—it will speak for itself. Price \$2 per bushel.

Sept. 1.

M. B. BATEHAM.

CALDRON KETTLES, all sizes,—also, CIDER MILLS of Cast Iron, at LANGWORTHY'S Eagle Furnace, near Genesee Falls.

MOUNT HOPE GARDEN & NURSERIES.

ROCHESTER, NEW YORK.

East side of St. Paul-street, nearly opposite Mount Hope.

THE subscribers offer for sale a fine collection of Fruit and Ornamental Trees, Flowering Shrubs, Green House and Hardy Herbaceous Plants, Bulbous Flower Roots, Double Dahlias, &c. &c. Orders sent per mail or otherwise will be promptly attended to, and all articles will be packed so that they can be transported safely to any part of the country. Gardens laid out and skillful gardeners furnished at short notice. Persons wishing assortments of any of the above articles to sell again will be supplied on very reasonable terms.

They would also inform the public that they are now removing their establishment from Buffalo and Sophia streets to the Garden as above, where they have new and more extensive Green Houses almost complete.

This establishment is intended to supply the Western States and Canada, with all articles in the line of Horticulture, and to prevent that delay and disappointment which almost invariably occur in obtaining them from the east; and in a short time, as soon as Trees, Plants, &c., can be arranged, a regular Botanical and Pomological Garden will be formed, of which due notice will be given to the public so that they may visit and inspect it.

Pricing in all cases will be as moderate as at any other establishment in the country, and no fruit of inferior or doubtful quality will be cultivated.

ELLWANGER & BARRY.

N. V. Sept. 1, 1840.

N. B. A quantity of Morus Multicaulis and Moretti, will be disposed of on favorable terms.

ENGLISH IMPORTED SEED WHEAT.

AS the Agricultural Fair will occur rather late for wheat sowing, the English wheat imported for the Society will be disposed of previously, to such farmers as feel disposed to try it. The price is 25 cents per quart, and the profits, if any, will be given to the funds of the Agricultural Society.

The following are the names of the kinds,—some of which are new varieties highly approved in England.

Table with 2 columns: Golden Drop, Eclipse, Whittington, Bellevue Talavera, Red Burrell, Pezglesham, Chiddam or Sussex, Downy or Bough Chaff. M. B. BATEHAM.

Rochester, Sept. 1st, 1840.

PORTABLE THRASHING MACHINES.

CLOVER MACHINES AND HORSE POWERS.

WARRANTED to be thoroughly built and to work well: made by THOMAS D. BURKALL, Geneva, Ontario Co., N. Y.

These machines have all been warranted "to be thoroughly built, and to work well," and they have fully sustained that warranty.

They have gone largely into use; more than four thousand are in operation; many of them have thrashed from ten to twenty thousand bushels each, without repairs. More than eight hundred new machines were sold during the last season; and on thorough trial, they have been recommended by those who use them "to be as complete, and to work as well as any in the world."

His new Combination Machine separates the grain from the straw in the process of thrashing, without any additional machinery; saves the labor of one hand in raking away the straw—much grain which is usually raked off with the straw—and is driven with less power than any other machine in use.

Geneva, June 27, 1840.

CHANCE FOR THE LOVERS OF FINE CATTLE.

FOR SALE,

That very superior Durham Bull, Reformer. IMPORTED by ROWLAND WINGFIELD, Esq.—7 years old, and whose calves are some of the finest in the country, and naturally bring a high price.

His pedigree may be seen by applying to Wm. Blackie, Esq., Secretary to the Gore District Agricultural Society, Hamilton, Upper Canada.

Apply to Wm. Benner, Esq., Binbrook, Stony Creek, or to the proprietor of the Hamilton Gazette, U. C. Binbrook, Sept. 7, 1840. 3m.

Save your Plum Stones.

CASH will be paid for a few bushels of Plum Stones, delivered soon at the Rochester Seed Store. Sept. 1st, 1840.

ROCHESTER PRICES CURRENT.

CORRECTED FOR

THE NEW GENESEE FARMER, OCT. 1, 1840.

Table of prices for various goods: WHEAT, CORN, OATS, BARLEY, RYE, PEAS, BEANS, POTATOES, APPLES, CIDER, FLOUR, SALT, PORK, BEEF, EGGS, BUTTER, CHEESE, LARD, TALLOW, HIDES, SHEEP SKINS, WOOL, PEARL ASHES, POT, HAY, GRASS SEED, CLOVER, FLAX, PLASTER.

Remarks.—The price of Wheat is still lower than last month, owing principally to the news from England. The last accounts state that the wheat crop throughout Britain is as good as the average, and the weather was quite favorable for harvesting. Only small orders were sent for flour from this country, although there was no great quantity on hand, and we think the next arrivals will bring larger orders. The wheat harvesting in those countries usually lasts about two months, and it is still somewhat uncertain what the result will be. The next steam packet will decide the question.

PUBLISHED MONTHLY

IN CONNECTION WITH THE ROCHESTER SEED STORE AND AGRICULTURAL REPOSITORY.

TERMS—FIFTY CENTS, per year, payable always in advance.
 Post-Masters, Agents, and others, sending money free of postage, will receive seven copies for \$3.—Twelve copies for \$5.—Twenty-five copies for \$10.
 The postage of this paper is only one cent to any place within this state, and one and a half cent to any part of the United States.

CONTENTS OF THIS NUMBER.

Prospectus of the 2d Volume of the New Genesee Farmer, for 1841. Disease in Swine—Inquiry. Apples, 161
 The Fruit Garden. Strawberries—Hovey's Seedling. Treatment of Peach Trees. Best soil for a Garden. "Rainy Days." Directions for making Cheese, and preparing Cheeses. A perfect Saut Machine. Breaking Steers. Gypsum—its effects on land. Clover seed. 163
 Fall Ploughing. The Flowers of Autumn. 164
 The Cattle Show and Fair at Rochester; Reports of the Committees on Cattle, Horses, Swine, and Sheep. 151-5
 Report on Crops. Premium crop of Corn, Potatoes, and Ruta Baga. Report on Horticulture. 165
 Report on Domestic Arts; on Agricultural Implements; on Ploughing. The new Many Headed Wheat. 167
 Remarks on the Fair at Rochester. Genesee County Fair. Pitts' Machine for Thrashing and Cleaning Grain. [cont.] 168
 The premium crop of Ruta Baga—explanation. Harvesting Potatoes. Portrait of the Cow "Daily Maid." 169
 Miking Milk for \$500. "The disposition to fattiness of different breeds of Hogs. The value of Farm Labor. 170
 Lower Section of Niagara. Two Letters from Ontario county, on the Fair and Ploughing Match at Rochester. Report of the Durham, U. C. Ag. Society. 172
 The Ontario county Society's Fair at Canandaigua; Report of premiums. 172-3
 Stock Farming. Improved Hens. A statement respecting Root Crops, by Jas. Gowen, Esq., of Fairport. 171
 A growing Orchard Grass with Red Clover. Fruit as food. Henry L. Ellsworth, Esq. Farmers' Daughters. Scraps. 175
 Reports at the Rochester Fair; Impressions abroad. Meeting of the Society. Funds of the Society—Legislative aid. Rochester Prices Current, &c. 176

ATTENTION READERS!

One more number will complete the first volume of this paper, and then our subscription books will be closed, and new ones opened. No papers will be sent thereafter unless ordered anew,—except to agents, respondents, &c., and therefore when our subscribers call at the Post Office for their next paper, they are requested to hand their new subscriptions to the Post-Master, and ask him to remit to us. But this is not all; if we have found favor in the eyes of our readers, as we hope we have, we earnestly solicit them not to hand in their own subscriptions alone, but do their neighbors and us a favor, by asking them to subscribe also. We are pledged to perform our duty faithfully, and hope our friends will perform theirs promptly. Let none delay; for we expect a mighty increase of subscribers about the 1st of January, and our edition may be exhausted so early that those who are dilatory will be disappointed about getting back numbers.—*Read the Prospectus in another column.*
BATEHAM & CROSMAN.

P. S. If any subscribers have not received all the numbers, and will inform us through the Post-Masters, the deficient ones will be sent.

Complete sets of back numbers can still be furnished to subscribers. All subscriptions must commence at the beginning of a year; and none will be received for a less time than one year.

TO CORRESPONDENTS.—Several valuable communications are omitted this month, in order to make room for the reports of agricultural societies. We are happy to hear from ANNETTE once more—we feared she had deserted us.

"Hints for the Month," are omitted, on account of the illness of our J. J. T.
 Where is our able friend 'NIAGARA?' Will he not let us hear from the "Cataract county?"

PROSPECTUS OF THE NEW GENESEE FARMER AND GARDENER'S JOURNAL.

EDITED BY J. J. THOMAS AND M. B. BATEHAM—ASSISTED BY DAVID THOMAS AND OTHERS:
 Bateham & Crosman, Proprietors, Rochester, N. Y.
 VOL. 2—FOR 1841—16 PAGES MONTHLY, (WITH CUTS.)
 The Cheapest Agricultural Paper in the Union.

TERMS.—Only 50 Cents a year—in advance. Seven Copies for \$3; twelve Copies for \$5; Twenty-five Copies for \$10—to agents and Post-Masters who send money free of postage.

"The New Genesee Farmer" has passed through the first year of its publication with very flattering success, notwithstanding the opposing influences which it had to encounter; and while the publishers express their gratitude for the assistance and support they have thus far received, they would now with renewed confidence appeal to the friends of agriculture, in behalf of the Second Volume. The successful re-establishment of the GENESEE FARMER in its own Native Soil, and, at its economical price, is a source of much gratification to the friends of improvement in Western New York; and the publishers flatter themselves that their efforts are not unappreciated, and will not long be unrewarded.

It is now fairly proved that the New Genesee Farmer can be sustained, at a price which places it within the reach of all; and the reputation which it has already obtained for *talent and usefulness*, will not suffer by a comparison with any paper of the kind in the Union. Every successive number which has been issued, has shown an increase of talent and additional correspondence. Besides containing the most useful and spirited articles selected from other agricultural publications, the New Genesee Farmer has received, during the past year, *original contributions* from more than SEVENTY WRITERS, most of whom are well known PRACTICAL FARMERS. This correspondence will continue to increase; and, with our able editorial assistance, we can confidently assure the readers of the paper, that it will continue to increase in interest and usefulness, in proportion as it becomes better known and more generally circulated.

The proprietors are determined to spare no reasonable pains or expense in making the New Genesee Farmer worthy of a liberal support. Several important improvements will be made in the next Volume; among which are the following:—Each number will contain items of English and other News, particularly relating to the crops and the markets; such as may be of service to farmers in marketing their produce. The paper will be of fine quality, and, with a handsome engraved heading, which is in a state of preparation, the appearance of the sheet will be much improved. The Farmer will be issued regularly on the 1st of each month, and mailed with great dispatch. A competent and careful clerk is employed to enter the names of subscribers and keep the accounts; so that we hope to avoid all inaccuracies or cause of complaints.

The aim and object of the New Genesee Farmer, is to please and benefit all of its readers, and advance the interests of Agriculture and Horticulture; the best interests of the community. Many of its readers have expressed the high degree of satisfaction they have derived from its pages; and we hope all are so well pleased with it, that they will not only renew their own subscriptions, promptly, but induce their neighbors to subscribe also. There are thousands of farmers to be found, who have never seen the New Genesee Farmer; and if it was shown them, and its character explained, they would readily subscribe. We conceive this to be a DUTY which the readers of the paper owe their neighbors, and to their country, as well as to us. Let this duty be done promptly, and our means of usefulness will be greatly extended, and the salutary influence of the paper will soon be manifest throughout the agricultural community.

The friends of Agricultural Societies should especially encourage this paper; for unless farmers READ on the subject, and get their minds interested in their profession, they will not act efficiently for its advancement. The Societies formed last year in Western New

York, and their fine exhibitions, have already given a new impulse to the cause in this section of country; and it is confidently expected that much more will be done another season.

It will readily be seen, that the paper cannot be sustained at this low price, without a very large subscription list; and as it will not afford the expense of employing travelling agents, we must rely on the voluntary efforts of the friends of the cause to obtain subscribers. To Post-Masters especially, we are already greatly indebted, and we respectfully solicit a continuation of their patriotic assistance.

Post-Masters have a right to remit money to publishers of papers, free of postage; so that subscribers have only to hand them their names, with the money, and request them to forward the same.

AGENTS AND POST-MASTERS are particularly requested to inform us, as early as possible, what number of papers are likely to be wanted at their offices, so that we may calculate how large an edition will be required.

Note.—All papers ordered, are charged to the persons ordering them; and the money is placed to their credit. All subscriptions are discontinued at the end of the year, unless paid for a longer time in advance.

Address BATEHAM & CROSMAN, ROCHESTER, N. Y.

Disease in Swine—Inquiry.

Messrs. Editors.—I find that your valuable paper is a medium through which we can freely express our views, or make known our experience, and also ask in return from others, such information as we may particularly need. It is this that has induced me to take up my pen, although when I subscribed for the New Genesee Farmer, I never expected to write a line for its pages.

A few days after I shut up my hogs for fattening, one of them (in good flesh at the time) was taken sick, and on being let out, he would run around in a circle, and frequently come in contact with other objects, as though blind. On the second day he appeared quite weak, but would still keep walking about the yard, or if he chanced to fall or lie down, he would kick and struggle as though dying or in great pain. He would not eat, but I poured down his throat some milk and sulphur, and afterwards me milk and pepper. On the fourth day he seemed rather better and drank a little milk. It is now a week since he was taken sick, and he has so far recovered as to eat a little corn, &c., but he is not yet well, and does not appear to see correctly.

There have been a number of cases of this kind of disease among Swine in this region, and if any of your readers can point out the cause or cure, they will perhaps save some valuable Porkers, besides much oblige your humble servant,
 J. S. WEBBER.

Hartland, Liv. Co., Michigan.

A Handsome Present.

The Honorable ADAM FRIGGUSON, of Upper Canada, on his visit at the Fair in this city, presented us a valuable collection of specimens of British Grasses, beautifully arranged by Mr. LAWSON of the Edinburgh Agricultural Museum, Scotland. Our most sincere thanks are due.

Apples.—There is a great abundance of apples this year, and if farmers will undertake to make many of them into cider, it will be a greater bill of expense to them than all their public taxes. This will certainly be the case if they drink it. Give the apples to the swine, except those wanted in the family.—*Maine Cultivator.*

By the growth of root crops and planting, Mr. COKE, the great English farmer, has increased the rental of his estates from 25,000 to \$200,000 per year.

The Fruit Garden.

What is the reason that such vast numbers of the *freshholders* in Western New York, only cultivate the coarse fruits? If we travel from the rising of the sun till the going down of the same—stop at every house by the road side where there is any prospect— inquire for the Black Tartarian or May Duke cherry, for Apricots of any kind, for the Yellow Harvest or sine quonon apple, for the Madeline or Jargonille pear, for the Plumotian or Green Gage plum, for the Early Ann or Early York peach—and if we find one half of these sorts out of the principal villages, we shall consider ourselves uncommonly successful.

If we ask, Is the soil unfavorable to such productions? The answer would be, *Not at all*—it is neither wet, nor sour, nor sterile. Are the winters too cold for the trees, or the sunshine in summer too feeble to mature the fruit?—Nothing of the kind. Fruit trees withstand our hardest winters, and mature their fruit whether the summers be wet or dry. What then? Have the people no taste for such simple luxuries?—Taste enough. There is scarcely a countenance in the land that would not brighten at the prospect of fine fruit; and every neighborhood within the limits of our knowledge has its *thiees* who are willing to risk a hundred and fifty dollars fine* and six months imprisonment to obtain a share.

What then can be the matter?—There are many reasons. Some perhaps, never heard of such fruits; many have never seen them; and many more may have never tasted them. Some dislike the expense of buying trees. Some forget all about it, in the time of planting. Some are too busy, hither and thither, to take care of them when they are planted; and some are too indolent. Some are afraid the fruit would be stolen, and some would rather steal.

Bad as the condition of our country is, in these respects, we do not despair; however; but look forward with confidence to a brighter day, not far distant. In some parts of Germany, the preceptors of public schools have to teach the art of planting and the management of fruit trees; and in some schools in England, they instruct the children in the principles of morality, and especially in regard to the sinfulness and meanness of petty thefts. "When the Spitalfields school was first established, it was found that *the children were habitual pilferers*. They constantly attended the markets, and levied heavy contributions on the fruit sellers. The master of that school succeeded so well in subduing this propensity, that though both flowers and fruit were within their reach, in the open space appropriated for their amusements, they scrupulously abstained from picking a single currant, or plucking a single leaf."

Now the State of New York, by means of her Common Schools, might soon give a new turn to public sentiment on this subject. Let every teacher who receives any part of his wages from the State treasury, be required to inculcate the most scrupulous respect for the property of others, placing all the products of industry on the same level; and a higher toned morality would soon be felt throughout all her borders. All pilferers,—whether of gardens or of hen-roosts,—would be treated alike; criminal courts would have little to do; and prisons might contract to far less than half of their present dimensions.

Legislatures indeed, have been engaged at times for centuries past, to determine the proper punishment

* The words of the law, are: "Every person who shall wilfully commit any trespass by maliciously cutting down, topping, girdling, or otherwise injuring any fruit or ornamental or shade tree, or by maliciously severing from the frehold any produce thereof, or any thing attached thereto, shall upon conviction be adjudged guilty of a misdemeanor, and shall be punished by imprisonment in a county jail not exceeding six months; or by a fine not exceeding one hundred and fifty dollars; or by both such fine and imprisonment."

for crime in all its gradations; but unless we mustake, not a thousandth part of the care or expense has been employed to prevent it. Who has gone round into every abode of the vicious and the negligent, *by authority*, to summon the children into schools for *morality* as well as *literature*? If the State has the right to punish crime, she has the right to prevent it. If she can wrest property from the hands of a drunkard, she can rescue a child from its vicious parent.

"All the children in Nassau," says a late traveler, "are obliged by order of the Duke to go to school from six to fourteen years of age;" and if they fail to do so, their parents are fined. This may seem like an arbitrary proceeding, but it is consistent. If the State has a right to train her youth for soldiers, she has a right to train them for useful citizens. †

Strawberries.

Hovey's Seedling. This is the name of a strawberry which was originated in 1834, by C. M. Hovey, Editor of the Magazine of Horticulture at Boston. It is the result of cross fertilization. It has now had a trial of three years, and each season, it has drawn the premium of the Massachusetts Horticultural Society! The editor says in his advertisement, "Gentlemen acquainted with all the other varieties cultivated in this country, have seen the bed in full bearing, and they unhesitatingly pronounce it to be the *largest, handsomest, best flavored, most productive, and hardy variety*, they have ever seen." Plants are offered at \$5 a dozen.

As some of our readers may obtain them, or other fine kinds at this season, we will offer a few words of advice in regard to planting.

Choose a spot so dry that wheat would not be drawn out by the frost; and then having prepared the hole, spread the roots, packing fine earth among them and on them in the firmest manner with the hand. When the earth is all filled in, press it down all round the plant with the foot, as closely and firmly as possible, so that water cannot lodge there, to expand into ice, and to draw up the plant from its bed. Even the plant itself may be trodden on, heavily; but be careful that there is no depression of the surface round it, to retain the water. For want of this precaution, we have lost many, in times past, but none since we adopted this method, though we have set out strawberry plants in winter, when the weather was open.

Bear in mind however, that all plants that lose a part of their roots in taking up, will be more tender than such as remain undisturbed; and that some covering to protect them from sharp frosts will be proper. We know of nothing better for this purpose than the branches of evergreens. †

Treatment of Peach Trees.

In a late number of our paper, we noticed the difference between peach trees suffering from *the yellows*, and from the worm at the root; but it is remarkable that some intelligent minds seem unable to comprehend the distinction. One imagines that this disease is induced by the worm; another thinks it is caused by intense cold suddenly succeeding mild weather in winter; and a third is satisfied it arises from the root soaking in mineral water. These opinions would be entitled to some respect, if the authors had respectively taken the pains to show us that the supposed cause was sufficient to explain the whole phenomena; but so carelessly have they looked at the subject, that they appear not to know that *the yellows is contagious*. Neither do they appear to know that it commenced its ravages in Pennsylvania and New Jersey, about the year 1797. Let us ask however, were there no peach worms, no unfavorable seasons, and no mineral springs for the trees to dip their roots in, previous to the year 1797? Peach trees were cultivated near

Philadelphia for more than a century before any such disease appears to have been known; and in Western New York more than thirty years passed away, after the Indian had resigned his old peach orchard to the white man. Before it was introduced amongst us, yet the worm was busy, the weather came as it listed; and the mineral springs where there were any, soaked away as they had done for centuries before.

The origin of this disease affords an interesting subject of inquiry and speculation; but like the origin of the small pox and measles, it will probably remain unknown; and the horticulturist may do well without such discovery, if he can be made properly to understand that it is *very contagious*. With this idea fairly before him, he will remove the sickly trees from his garden before they contaminate the others; and he will be careful not to let any tool that has been so employed, especially the saw, be used on a healthy tree before it has been thoroughly cleansed.

The peach worm, though an enemy not to be despised, rarely destroys a tree, except when it is small, or when considerable numbers attack it at the same time. It has been several years since we went round among our large trees to search for this insect; and we have no reason to think that more than two or three have suffered materially. Still we would recommend the search to every proprietor who can steal away from his other avocations.

The oozing of the gum in wet weather, is no certain indication of the worm, especially if it be on the trunk, a foot or more from the ground; but when the gum is crowded with filth, diligent search should be made. Remove the earth from the tree to the depth of two or three inches; and with a strong pocket knife endeavor to find the cavity where the depredator resides. Vile as the outside of his dwelling appears, the inside is generally kept clean—(not crowded with ordure like the track of the borer.) When the knife once enters this covered way, which is cut in the pulpy part of the bark, it is commonly easy to find him; but in all cases where it is practicable, cut longitudinally, and not cross-wise. When the worm is removed,—and no creature can be more helpless when he is expelled from his nest,—the hole should be laid open through its whole length, and then filled with clay mortar, or some other composition. A peach tree very speedily recovers from such wounds.

Lime or ashes laid close round the tree is an excellent preventive of the worm; and if the lime has become mild, or the ashes leached, one or two shovelful may be very safely applied. Quick lime, especially hot lime, or unslacked ashes however, may require to be given in smaller quantities.

The advantages of such applications appears to be that the grass is destroyed, and consequently the bar is harder down to the very surface of the lime or ashes,—near which the mother insect is more unwilling to deposit her eggs.

A few words in regard to pruning. As soon as the peach trees show symptoms of being stunted by bending,—amputate, and encourage the growth of young vigorous branches. The fruit on such is often as fine as the fruit of a young tree. †

The Best Soil for a Garden.

It is the general opinion that a warm, light soil with an inclination to the South, or East, is the best for a garden. In high, moist regions, this rule may be unerring; even in the warm, dry climate of Seneca it may hold good for early vegetation, and for those vegetables which by their shade are enabled to prevent the escape of moisture from the soil, like Indian corn sugar beets, &c. But by far the most productive garden in this vicinity is on a flat surface of heavy clay loam. It is generally too wet to plough before the middle of May. A detail of the yield of potatoes

ions, squashes, cabbages, &c., in this garden, would hardly obtain belief; while in a dryer, equally rich soil, in the immediate vicinity, the yield in potatoes is not one-fourth as great, and cabbages and onions are little more than half as large.

This garden, in a wet season, is relieved by a ditch; but in seasons like the present, all the surplus moisture is absorbed by the fresh horse manure in the soil to aid proper fermentation and distribution. S. W. Waterloo, Oct 20.

"Rainy Days."

MESSRS. EDITORS—I observed in your last number, the remarks of W. S. T. respecting the improvement of rainy days by farmers. W. S. T. says, that in the course of a season there are many days of wet weather in which it is impossible to do work on a farm; then he goes on to show in what manner he would improve the time which he says is lost by many farmers of his acquaintance. "Brother farmers," he says, "get yourselves a set of carpenter's tools and make a work bench, &c. In this way you will be able to improve every rainy day, and thereby keep your buildings and fences in good condition." Now, I am not acquainted with the whereabouts of W. S. T., but in all my travels, I have observed that every farmer's fence is made out of doors, and that any person who should attempt to repair it during a rainy day would be in nearly as much danger of getting wet as if he were doing any other work in the open air. I should every person would infer from the remarks of W. S. T., that his fences were in his house. I should also differ from him in some respects as to how "rainy days" are to be improved by farmers. I think that every farmer (especially every American farmer) ought to devote at least one half of his time during wet weather, to the improvement of his mind. It was not created to be continually laboring to harden property. He was created for nobler purposes.—Every man has a mind susceptible of improvement; the farmer who does not cultivate his mind as well as his farm—who does not grow wiser and better as he grows older, neglects his best interests and falls off at the end for which he was created. I would therefore say to friend W. S. T. the next day that it is so hard that you cannot cultivate the farm, and of repairing your "fences," go into your study and cultivate your mind by reading some useful books or papers. You will never repent of the time in which you improved that rainy day, should you live to become an aged man. H. C. M.

Directions for Making Cheese.

MESSRS. EDITORS—I noticed in one of the late numbers of the Farmer, that a correspondent is desirous of being acquainted with the most approved mode of making cheese.—I have had some experience in this matter, both in New York and in this country; and the price at which my cheese is now selling in this city, (which is \$12.50 per hundred,) I think I can safely say that there has never been a better article of the kind offered in any market. I am aware that the scientific requirements are not sufficient to subject justice; nevertheless, if what instructions I can give, in my plain style, can be of any service to any of your readers, I shall feel myself amply repaid.

Take the milk obtained from the cows at night we strain it into the cheese tub, and if the weather is so warm that there is danger of the milk turning sour before morning, we fill one or two tin pailsful of cold water and pour them into the milk in the tub. By so doing the milk is kept sweet. In the morning we take off the cream with a skimmer, and put it in a vessel by itself. We then put the morning and the night's milk together; then take one pailful of the milk and

put it into a cauldron kettle, which is set in an arch for the purpose, and start a slow fire till it is heated to about blood heat; then pour in the cream and stir it moderately till there are no particles of it to be seen floating on the surface; then dip enough milk from the tub to fill the kettle, heat it enough, so that when dipped back the whole will be about the same temperature as when it comes from the cow; then put on the rennet and stir it well, and then cover the tub over with a cloth or strainer, and let it remain undisturbed till the milk is sufficiently coagulated, which, if the right quantity of rennet is used, will take from fifty minutes to one hour; then apply the curd breaker, which is an instrument something in the form of a screen to a fanning mill, about two feet long and one foot wide, with brass wire woven in squares, so that when used it leaves the curd in particles about three-fourths of an inch square. Pour two or three dipperfuls of hot water on to the curd, which will cause the whey and curd to separate; then dip off the whey in small quantities till you have obtained about twelve or fifteen quarts; heat this nearly to boiling, and dip it back into the tub, and stir it well with the hands; then dip out a kettleful of the whey, and while it is heating, break up the curd in the tub with the hands. As soon as the whey is heated to nearly boiling, pour it back into the tub and stir it well with the hands; then dip out another kettleful of the whey, heat it and dip it back as before, and repeat this process till the whole is as hot as the hands can bear. By this time it is sufficiently scalded to whey off; we then spread a strainer in a sink, constructed with a rack in the bottom, made of narrow slats, to allow the whey to run off. While the curd is cooling, keep working and breaking it. Curd cannot be made too fine for pressing. When it is nearly cool, salt it. To fifty pounds of curd, put three common sized teaspoonful of salt, and continue to work and break the curd till it is cool; then put it into the hoop for pressing. Cheese cannot be pressed too hard. We press ours forty or eighty hours.

Hardensburg, Ia.

To Prepare Rennets.

When taken from the calf, empty and rinse them in cold water, and fill them with salt: then pack them away in a jar and cover them well with salt. To prepare them for use, I take two or three of them and put them into an earthen vessel that will hold about two gallons, and fill it up with sweet whey. After they have soaked for about twenty four hours, the liquor is fit for use—always remembering to keep it very salt. As the liquor is used out, it should be replenished with sweet whey. When the liquor becomes so weak as to require three times the quantity used at first, I throw away the old rennets, and replenish the jar with new ones. As to the quantity to be used, the time which it takes to coagulate the milk, should be the criterion. From fifty minutes to one hour, is about the right time. If it coagulates sooner than that, too much rennet is used, and it will make the cheese strong. If milk is the least changed before it is set for cheese, less scalding is necessary. If scalded too much, the cheese is apt to crack. A. F. BILL.

Hardensburg, Ia. 1843.

A Perfect Smut Machine.

MESSRS. EDITORS—Perhaps there is no one article of machinery which has cost the farmers more money, with so little real success in its operation, as that of the Smut Machine. This great difficulty is at length surmounted; and that desideratum, a thorough cleanser of wheat and huller of buckwheat, is found in Grimes's Patent Cylindrical Cast Iron Smut Machine. We have just seen one put in operation in Watkins's mill, South Waterloo. Twenty bushels of very black, damp, smutty wheat, was so thorough-

ly cleansed, that no one would suspect that a single head of smut had ever been present.

The superior execution of this machine, is owing to the friction of the wheat against the smooth ribs of one revolving, and one standing cylinder, and the creation of a powerful upward draft of air, which takes off all the light particles as fast as they are disengaged from the berry.

This machine stands about six feet high, and occupies only three feet of square surface. It will clean wheat at the rate of twenty-five bushels an hour, grinding and blowing out all chaff, ridding and dirt, and every other light substance.

The price for machine and right to use it, is \$260. J. H. Dunke of Utica, is general agent. E. H. Conklin, of Seneca Falls, is agent for this section of country. The machine will be manufactured by Williams & Purdie, machinists of this village.

Waterloo, Sen. Co. Oct. 12.

S. W.

Breaking Steers.

MESSRS. EDITORS—Several modes of breaking steers have been stated in your valuable paper—some of which I should not wholly approve; but with your permission, I will give one of my ideas on this subject.

When these useful animals are old enough for the yoke, place them in a stable, side by side, with hay before them, and confine them with ropes. In this position they can be landed at pleasure. Then place a yoke upon them, and directly in their rear fasten a strong hook or staple; to this attach a chain and fasten to the yoke with sufficient length, so that by pulling, they can barely reach their food. In this position they will soon learn to pull, and become familiar with the yoke. When taken from the stable, put them before a sled, and you will find them ready to draw any reasonable load you may put behind them. You have nothing to do but to guide them in the ordinary way of breaking steers. I. B. L.

Nearfaxe, Niagara Co. 1-10.

Gypsum—its Effects on Land.

MESSRS. EDITORS—Living near a plaster mill, I have taken pains to inquire of many intelligent practical farmers, when they come to the mill, their opinion of its fertilizing power. On light sandy loams the ploughing in of plaster has been found, by repeated trials, to be much better than sowing it on the growing crop. But on stiff clay soils, ploughing in plaster is not attended with the same favorable results. All agree that plaster draws a fructifying moisture from the atmosphere when aided by vegetable matter in the soil; but some men are so stupid and perverse, that when all vegetable fertility is exhausted by cropping, and plaster fails to perform a double office, they lay the whole blame, cause, effect and all, to this most precious, quickening mineral plaster. SENECA.

Clover Seed.

MESSRS. EDITORS—It is supposed that the county of Seneca alone, has this year yielded more bushels of clover seed than all the other counties in the State.—More than one farmer has raised over 100 bushels. It is computed that the clover seed crop of this county is worth more than twice its wheat crop.

There is very little doubt, however, that this extended growing of clover seed, has had an injurious effect on the quality and quantity of our wheat crops. In Ontario county, where they grow but little clover for the seed, the wheat crop is as good now as it was ten years ago, while in this county the deterioration has been great. Wheat wants the sacrifice of the green crop of clover, it will not thrive on a stubble whose attenuated roots have hardly commenced a hold upon the earth. SENECA.

In scalding hogs, it is best to dip them first in cold water, and then in hot—the bubbles come out easier.

Fall Ploughing.

Let no man neglect this who has a heavy, clay soil; turn under straw, or manure, if you have it. Frost, like fire, destroys the adhesive properties in the clay, for a year at least. A garden thus ploughed, with two furrows thrown together, needs no ploughing or spading in the spring. S.

The Flowers of Autumn.

As the splendor of many other plants decline, that of the *Dahlia* brightens; not in color however, but in the number of its flowers. This in part is owing to the fine rains that we have lately had; and in part to the inactivity of the little bug that destroys the blossom bud in the heat of summer.

It is not our intention to give a catalogue of fine Dahlias, for doubtless there are hundreds of this class that we have never seen, and never may see; and the kinds that we have cultivated are probably now old-fashioned; yet the Countess of Liverpool, the King of the Yellows, and Lady Liston, have their peculiar beauties, which will not be easily eclipsed.

The most simple way to preserve the roots through the winter, is to hang them up by a string in a cellar that never freezes; and there let them remain until spring. The air perhaps may become too dry for small roots, but those of a larger size with us, have never withered enough to be injured materially.

By the same method, we have been very successful with the Tuberose, *Gladiolus natalensis*, the Tiger Flower, *Amaryllis formosissima*, and other plants that decorate our borders in summer, but cannot withstand the frosts of winter. To roll them in a cloth of one or two folds, whether of woollen, cotton, or linen, is doubtless an improvement, as it tends to equalize the heat, and perhaps the moisture.

Sternbergia lutea (separated from *Amaryllis*) has deep green leaves, and a golden blossom expanding like the *Crocus*. Its freshness, while so many other plants are withering round it, is very pleasing. Its leaves retain their vitality through the winter and spring, until after the commencement of warm weather, when they decline; and then is the best time to remove it, or to separate the bulbs.

Another delicate ornament of autumn is found in the *Crocus scrotinus*. The petals are finely striped with different shades of purple; and when the flower is spread open, it measures three inches and a half in diameter. It is quite a favorite. For several years it barely kept alive; but now it is increasing in vigor and number, as if its own recreation had manured the soil.

Amongst the plants that bloom for many months in excession, is the *perennial flax*. Some of its stems, four feet in height, are still surmounted by its blue flowers.

Thunbergia alata is a climber with cream colored blossoms and a dark eye. It grows finely in the hot-bed where its seed germinated in the spring. It has also been in bloom many months.

Salvia salicifolia (?) is a southern plant, but it abides our winters in a covered border. Several stems rise from one root, about five feet high, with many blossoms of a beautiful blue which open late in the season.

Eupatorium caelestinum has light blue flowers, as its specific name implies; and though pretty, it is evidently better adapted to a more southern climate. It very much resembles *Ageratum mexicanum*.

Monarda punctata requires a sandy soil; and with its dotted flowers and large colored bracts, makes a fine display. It is an imperfect perennial, the roots becoming rigid with age, and impairing the vigor of the plants.

Erythraea Centaurium (separated from *Chironia*) grew from seeds purchased in Switzerland, but it is also a native of England,—a pretty plant with pink flowers. It has now become naturalized in the garden, growing freely among the grass; and perhaps the best way to naturalize *Sabbatia vulgaris* which it greatly resembles, but which has larger flowers,—would be to scatter the seeds on the sward. The grass would protect the young plants from the white frosts above, and the heaving action of the black frosts below. In the open border, we have failed entirely in our attempts to introduce this beautiful Centaury, once so common among the fields of the south.

Aster suarcolens rarely blossoms before the time of white frosts, and continues in bloom till the cold becomes severe. Its pale blue flowers are neat and pretty.

Paeonia corallina is very showy, like others of the same genus, in the early part of the warm season; but when the seed vessels open, after its leaves are faded and dead, it is the most interesting. The perfect seeds are shining black, but the abortive seeds, more numerous, are a fine red; and the contrast of colors is very pleasing.

The Dwarf Cockcomb with heads of the richest scarlet velvet, appears to great advantage. Another plant, not remotely allied, is the monstrous *Amaranth* with large club-like epikes of a dark crimson.

Lupinus crukshankii is finer in form and color than in name, which is harsh enough for the ears of a muleteer. Blue, white, and yellow, are delicately arranged on its flowers.

Stenactis speciosa which bloomed early in summer, has sent up new stems, and again shines out. A similar circumstance has given us many flowers of the Chinese Larkspur.

Virgin's Stock (not Virginian, of which country it never was a native) continues very pretty; and if we mistake not, has been in blossom more than "Ten Weeks."

On the morning of the 13th ultimo we had the first white frost—very slight however, scarcely discoloring the foliage of the *Dahlia*; but the severity was increased on several succeeding mornings until ponds were covered with ice. This has terminated the bloom of all our tender plants; but the Verbenas, Drummond's Phlox, the white and purple *Petunia*, and many others continue almost as bright as ever. It is remarkable that some natives of warm climates, as the *Maurandya*, resist such depressions of temperature without injury.

THE CATTLE SHOW AT ROCHESTER.

The following are the Reports of the different Committees appointed as Judges, to award the Premiums offered by the Genesee Agricultural Society, at Rochester on the 7th of October.

REPORT ON CATTLE.

We, the judges appointed by the Committee to inspect the various classes of cattle, brought forward for exhibition and competition this day, beg leave to report as follows:—

1. BEST IMPORTED BULL.—\$20.

To W. McKnight, Esq., for his Bull, *Sir Walter*—Improved Durham breed—bred by ADAM FERGUSON, Esq.

(Note.—Mr. Ferguson did not set with the committee while judging on the Bulls.)

2. BEST IMPROVED NATIVE BREED.—\$15.

To TIMOTHY N. GOODWIN, for his two year old Bull, *Echo*—Improved Durham—bred by T. WEDDELL, Esq.

3. BEST IMPORTED COW.—\$15.

To JOHN BAKER, of Macedon, for his Roan Cow, *Darling'on*—5 years old.

4. BEST IMPROVED NATIVE COW.—10.

To THOMAS WEDDIE, for his Improved Durham Cow, *Gazelle*—dam Prize, by imported Roan.

5. BEST YEADLING BULL.—\$7.

To HAMILTON ROGERS, Esq., of Arcadia, (Newark,) for his improved Shorthorn, *Deacon*.

6. SECOND BEST YEADLING BULL.—\$5.

To CHARLES C. WOOD, Esq., for his mixed breed.

7. BEST YEADLING HEIFER.—\$6.

To THOMAS H. NEWBOLD, Esq., for his Improved Durham Heifer, *Lily*.

8. SECOND BEST YEADLING HEIFER.—\$4.

To JEREMIAH BROWN, Esq., of Ridgeway, for his native blood, with foreign cross, very large and fine.

9. BEST BULL CALF.—\$5.

To JOSEPH C. HATHAWAY, for his 9 months old Calf, out of Lady Bowen—Improved Durham.

10. SECOND BEST BULL CALF.—\$4.

To W. R. SMITH, for his 3 months old Improved Durham—dam, Jessamine.

11. BEST YOKE OF OXEN.—\$10.

To NATHANIEL FORDYCE, Esq., of Pittsford, for his 5 year old *Red Oxen*.

15. SECOND BEST YOKE OF OXEN.—\$7.

To JOHN AYRAULT, Esq., of Perrinton, for his 4 year old *Red Oxen*.

13. BEST YOKE 3 YEAR OLD STEERS.—\$6.

To J. G. LONGFELLOW, Esq., (light brindle.)

BEST TWO YEAR OLD STEERS.—\$4.

To JOHN AYRAULT, Esq., of Perrinton—Red Devon.

In connection with the above report, the committee have to express their regret that the limited number of premiums offered by the society, confined their discretion to so small a circle. The number of beautiful rare, and fine animals, was very large; and considering that this was the first exhibition of the kind in the district, and the spirit of agricultural fairs but little understood, they are only surprised that the display was so highly creditable to the farmers who exhibited their stock. Nearly 150 head of horned cattle alone were upon the ground; many of them the finest specimens of Improved Short Horns, imported recently from England, and rarely surpassed in point of excellence. Many native animals too, descended from imported stock, were there, nothing deteriorated from their ancestry, and doing ample credit to the good taste and skill of their breeders. There were also many specimens of grade animals, showing the result of a foreign cross of different breeds upon our native stock; and proving beyond dispute, the absolute superiority of all improved over the common cattle of our country.

Although the committee were obliged, in the performance of their duties, to confine the range of the premiums to a small compass, yet many other animals were exhibited highly deserving commendation; as their appearance told volumes in favor of the thrift and good husbandry of the substantial farmers who bred them. A brief notice of some of them, the committee hope will not be deemed invidious.

GEORGE CORNELL showed a fine young Bull as Heifer, 4 years old, from the *Patron* stock, of Albany—Improved Short Horn—both superior animals.

M. D. DICKINSON, one Short Horn and one Ayrshire and Short Horn Bull—2 years old.

THOS. H. NEWBOLD, of Avon, exhibited two beautiful, thorough bred, Short Horn Heifers, from imported cows and bull; one of which took the premium (*Lily*.) and both were purchased on the ground, L. F. ALLEN, of Black Rock.—Mr. Newbold exhibited two fine Bull calves, thorough bred Shorthorns; one of which was purchased by WILLI WADSWORTH, Esq., of Genesee.

JACOB STRONG—a fine Holderness Bull, and a superior Calf, and one pair excellent Steers.

HAMAN CHAPIN—two likely grade Calves—foreign crosses.

JOHN ALDEN—a fat Ox—extraordinary in size—weighed 3,300 lbs.

LEMUEL SEXTON—one pair fine half blooded Durham Oxen, 6 years old.

GIDEON RAMSDALL—two pair superior three year old Red Steers, of mixed Devon and native blood.

GUY COLLINS—three year old Short Horn Bull, Leo. A Bull calf, red and white, six and a half months old.

JOHN AYRAULT—two pair superior four year old Red Oxen—one pair three year old Red Oxen, and one pair two year old Red Oxen. These were all yoked or chained together, and presented a fine appearance.

MESRS. CHURCH & RICHMOND—Bull, *Hector*, one year old, Durham, from Patroon's stock at Albany.

STEPHEN HENDEE—the thorough bred white Bull, Nye-Comet, four years old—a remarkably large and showy animal, in capital condition.

JOSEPH C. HATHAWAY—the celebrated Short Horn Cow, *Lady Bower*—imported by THOMAS WEDDLE, who states that this cow has given 36 quarts of milk per day;—also, her nine months old Bull calf, *Welham*—very superior.

THOMAS WEDDLE—a beautiful white Short Horn Heifer calf (dam, *Gazelle*, the prize Cow of the day,) and Bull *American Comet*, two years old, thorough bred—from imported Cow, *Primrose*, and imported Bull, *Rover*—both sold to Kentucky.

WM. R. SMITH—a three year old Short Horn Cow, *Jessamine*, dam *Lady Bower*, as above, with her fine Bull calf, three and a half months old.

DOCTOR BALDWIN, of Clarkson—a fine Short Horn Cow, *Matilda*; from the late Dr. Hosack's imported *Matilda*—eight years old—sold to THOMAS WEDDLE, Esq. Also, a Short Horn Bull, (white,) sold to H. TILLOU.

WM. MCKNIGHT—the imported Short Horn Bull, *Sir Walter*, seven years old—imported by HON. ADAM FERGUSON, of Hamilton, Upper Canada.—A lot of fine half blood calves, sired by *Sir Walter*.

SAMUEL WOOD—three Devon Cows.

THOMAS WRIGHT—a fine Short Horn Bull Calf, seven months old.

J. D. NORDEN—a fine red native Cow.

HENRY TILLOU—a superior red and white Short Horn Bull—from Patroon's herd at Albany—sold to DR. BALDWIN.

OLIVER SKINNER—a lot of large and fine Holderness Calves.

JOHN BAKER—the imported Short Horn Bull, *Eclipse*, 5 years old, Red Roan;—also the imported cow, *Darlington*, 5 years old, Red Roan. These were choice animals. A Bull Calf, from the above—very superior.

HAMILTON ROGERS & EBON BLACKMAR, Esqrs., of Newark, Wayne co.—a lot of high blooded Short Horn Cows, Bulls, Heifers, and Calves. Two of the Cows, *Folage and Calf*, and *Delight*, and the Heifer *Daisy*, thorough bred herd book animals, were purchased on the ground by L. F. ALLEN, of Black Rock.

P. C. SILLIERIDGE—a pair superior two year old Steers.

WM. R. BOOTH—a Red Bull, 9 months old—Short Horn and Devon cross—weighed 1,165 lbs.—well formed, and just in his proportions.

MR. BETRIDGE—a Short Horn Bull and Heifer—imported by himself—very fine—Red Roan.

JEREMIAH BROWN—a yoke of four and five year old Oxen—large and fine.

HON. ADAM FERGUSON, of Nelson, Upper Canada—his thorough bred three year old Short Horn, herd book Bull, (Roan,) *May Duke*—dam, imported Cow, *Cherry*—sire, *Sir Walter*. This Bull was taken by L. F. ALLEN, of Black Rock. Also his yearling thorough bred Bull sired by *May Duke*. Both large and fine animals.

ARNOLD BURROWS, Esq., of Upper Canada—two thorough bred Short Horn Bulls—from the stock of J. H. POWELL, Philadelphia.

Many more animals were on the ground, excellent of their kind, and whose owners were not noted down, from the haste in which they were viewed; but we can freely say that many of the animals exhibited, were hardly to be surpassed, and some rarely to be equalled, on this side the Atlantic. It is a source of pride and gratification to us to know that the patriotic and spirited farmers of this and the immediately adjoining counties, can show stock like these, and we trust that they will persevere in a course so ennobling and advantageous to the agriculture of the state.

Many owners of stock desired to sell; but owing to the excessive pecuniary gloom of the times, only a few came to buy; and if the sellers were disappointed in their expectations, they had the solid satisfaction of knowing that they were still the owners of superior animals, which, at a future time, will realize their full anticipations. Instead, therefore, of any cause of dissatisfaction, every member of the society should feel proud of his own success, and prepare, with increased vigor and enterprize for the Genesee Cattle Show of *Eighteen Hundred and Forty-One*.

L. F. ALLEN,
ADAM FERGUSON,
ROBERT ROCKWOOD,
GEORGE FORDON,

Committee.

REPORT ON HORSES.

The duty assigned to the committee on Horses, although in some respects a difficult one, was at the same time one which afforded them much gratification. The display of horses exhibited was such, both for number and beauty, as no lover of this noble animal could witness without feeling a high degree of pleasure. The committee are confident that every member of the Society—every farmer of Western New York who saw this exhibition, must have been highly gratified with the array of splendid horses brought together on this occasion.

Among so much beauty and perfection, it may well be supposed that it was quite difficult for the committee to decide which were the most beautiful and perfect; but they decided according to the best of their judgment, and awarded as follows:—

For the best Stallion, to OLIVER CULVER of Brighton, \$15—“*Young Henry*.”

For the second best do., to JOHN AYRAULT of Perinton, \$10—“*Sir Isaac*.”

For the best Brood Mare, to OLIVER CULVER, \$10.

For the second best do., to ALEXANDER KELSEY of Rochester, \$5.

Among the horses exhibited, besides the above, were “*Young Turk*,” by C. D. CULVER; “*Tipperanoe*,” by PETER TONE; “*Sampson*,” by JOHN ROBINSON; “*Alfred*,” by THOS. WEDDLE; “*Young Lion*,” by J. K. VALENTINE; “*Young Alfred*,” by G. COLLINS; and a number of others deserving of notice, but no record of which was preserved by the committee.

Fine Mares were exhibited, besides those mentioned above, by HENRY S. POTTER, JOHN AYRAULT, J. K. VALENTINE, JOSEPH ADAMS, and by several other persons.

The committee regret that no premium was offered for matched work horses, although a good number of fine young animals were exhibited, in order to show the stock of the different mares and stallions.

In conclusion, the committee hope that none will feel dissatisfied with their decisions, but that all will lay aside selfish considerations, and rejoice in the promotion of the common interests of the Society.

Signed, LEMUEL THOMPSON,
SAMUEL HAYT,
CHAS. F. CROSMAN,
Committee.

REPORT ON SWINE.

The Swine exhibited on this memorable occasion, were quite numerous, and their beauty and excellence were matters of surprise to many who witnessed them. The exhibition afforded good evidence that a great work of improvement is going on in this department of farm economy.

After a careful examination, the committee decided to award as follows:

For the best Boar, to Col. AMOS SAWYER of Rochester, \$5; (Berkshire.)

Second best do., to A. ALDRICH of Perinton, \$5; (Leicestershire.)

Best Breeding Sow, to Col. A. SAWYER, \$6; (Berkshire.)

Second best do., to H. GAY, Esq., of Gates, \$4; (Leicestershire cross.)

Three best Pigs, to Col. A. SAWYER, \$5; (Berkshire.)

Second best do., to Mr. GEO. WHITNEY of Rochester, \$4; (Berkshire.)

Mr. T. M. WATSON of Rochester, exhibited a very large and fine Leicestershire Sow and pigs; Mr. Jas. W. SAWYER of Rochester, two very fine Leicestershire Pigs; Mr. ISAAC MOORE of Brighton, a very large and fine Berkshire Boar; Mr. C. LEGGETT of Henrietta, two very nice sucking Pigs. Many other very fine swine were exhibited, deserving of more particular notice, would time and space permit.

THOS. WEDDLE,
WM. C. CORNELL,

Committee.

REPORT ON SHEEP.

The committee on Sheep respectfully ask leave to report, that in consequence of the large number of splendid Sheep exhibited, they found it difficult to decide to whom to award the premiums; and they regret that their limits prevented their extending them to several others who exhibited very beautiful Sheep.

After a close and very particular examination, the committee were unanimous in awarding as follows:

For the best Buck, for fleece and carcass, to RICARD RANDALL of Chili, \$10; (Southdown.)

Best do. for carcass only, to JOHN BETRIDGE of Riga, \$8; (Leicestershire.)

Best do. for fleece only, to CHARLES MERCHANT of Greece, \$8; (Saxony.)

Best 3 Ewes for fleece and carcass, to GEORGE BROOKS of Brighton, \$8; (pure Southdown, imported from the Duke of Richmond's stock.)

Best 3 Ewes, for carcass only, to WM. C. CORNELL of Henrietta, \$3; (Leicestershire.)

The committee would particularly notice the Sheep exhibited by GEX. HARMON of Whelan land, JAMES PARSONS of Riga, and C. B. MEEK of Canandaigua, as being of very fine quality. Several other lots exhibited were deserving of high praise.

E. M. PARSONS,
WM. J. SOUTHERIN,
JOHN ROBINSON,

Committee.

REPORT ON CROPS.

The committee to whom was allotted the duty of examining the certificates of field crops offered in competition, would report, that they have awarded premiums on the following—the particulars concerning which are herewith annexed.

Premium Crop of Corn.

CERTIFICATE.

We hereby certify that we measured one acre of Corn on the farm of Mr. Samuel Davidson, in the town of Greece, as follows:—We measured the ground, eight rods by twenty, which we found to contain one hundred rows eight rods long. We then husked four rows, of a fair average quality, from which we obtained ten bushels of ears. We then shelled two bushels of these ears, and the product was thirty-eight quarts, or one bushel and one peck of shelled corn. We then computed the product of the whole acre, and found it would yield two hundred bushels of ears, or one hundred and eighteen bushels and three pecks of shelled corn.

JOHN CRAWFORD,
JONAS BEACH,
FERDINAND DAVISON.

Greece, Oct. 6, 1840.

SOIL AND CULTIVATION.

This corn was raised on a piece of new land—dark sandy loam, never manured. The timber was chopped in 1837, and the ground cleared in 1839. It was ploughed twice, and harrowed last year; and ploughed and harrowed last May. The third day of last June I ploughed it again and planted it. The rows were a little less than three feet apart and the hills from two to two and a half feet apart in the rows.—From three to five grains of seed were dropped in each hill. Three weeks after planting, I ploughed between the rows with a small plough; and after a few days ploughed it again, and repeated it twice after during the summer.

The kind of corn is an eight rowed yellow variety. I have no particular name for it, but it is the most productive sort of flint corn that I have any knowledge of.

Yours, &c.,

SAMUEL DAVISON.

Greece, Monroe co. Oct. 7, 1840.

Note.—Mr. Davidson was also a competitor for the premium on potatoes. His certificate shows a product of 31½ bushels per acre—of the round pink eye and flesh colored varieties. Soil, dark, clayey loam—no manure—land been four years cleared—borne two crops of wheat and one of oats. It was ploughed twice last spring and well harrowed—farrowed both ways, and planted 14th day of June.

Premium Crop of Potatoes.

CERTIFICATE.

This may certify that we measured one acre of potatoes on the farm of Mr. George Sheffer in the town of Wheatland, and the product was found to be four hundred and thirty-five bushels by measure, or three hundred and ninety-two bushels by weight, at sixty pounds to the bushel.

JOHN LEET,
MERICK JENCKS.

Wheatland, Oct. 6, 1840.

SOIL AND CULTIVATION.

These potatoes were raised on the Genesee Flats, which is a black, clayey loam. It was in meadow the year previous, and was manured at the rate of thirty loads to the acre before ploughing, and twenty-four loads to the acre deposited in rows. The potatoes were planted 26th of May, in rows or drills, three and a half feet apart, and the sets dropped about one foot apart in the rows. The kind of potato is what is

called the large, round *Pink Eye*. I cut the seed so as to have about two eyes to each piece.

GEO. SHEFFER.

Wheatland, Oct. 6, 1840.

Premium Crop of Ruta Baga.

CERTIFICATE.

This may certify that we measured one square rod, of a fair average, of one acre of *Ruta Baga*, on the farm of SAMUEL WOOD, in the town of Wheatland, and the produce was nine and a half bushels to the rod, or fifteen hundred and twenty bushels to the acre.

THOMAS STOKOL,
WILLIAM BARTON.

Wheatland, Oct. 6, 1840.

SOIL AND CULTIVATION.

The soil is a sandy loam—borne wheat in 1839—ploughed once in the fall, and twice in the spring.—Twenty loads of well rotted manure were deposited under the drills, which were about twenty-two inches apart. Seed sown 1st of May. The crop was twice dressed with the cultivator and hand hoe.

SAMUEL WOOD.

Wheatland, Oct. 6, 1840.

Note.—As this extraordinary crop of ruta bage has excited considerable surprise among the members of the society, we have taken pains to obtain some additional particulars concerning it, which may be found in another column.—*Eds. New Gen. Far.*

Mangel Wurtzel.

There was no competition for the premium on this crop. The only certificate offered was by GEO. SHEFFER, of Wheatland, which showed a product of one thousand and fifty bushels per acre.

There was no competition on *Sugar Beets* or on *Carrots*.

Besides the above, there were a number of very large crops offered in competition; but time and space will not allow a particular notice of them at present.

H. N. LANGWORTHY,
JOHN LAKE,
JAMES GAY,

Committee.

REPORT ON HORTICULTURE.

Considering the little effort that had been bestowed on this department by the society, and the lateness of the season, the display of horticultural productions was very good; indeed it was much better than might have been expected under the circumstances.

OF GARDEN VEGETABLES.

Some fine specimens were exhibited; but the competitors for the premiums were not as numerous as could have been wished. The committee awarded as follows:—

For the best two heads of *Cabbage*, to B. KLAIN: for very large and fine Leids of the Drumhead variety, \$2.

Best three *Watermelons*, to H. N. LANGWORTHY. Very superior—no competition—discretionary premium, \$2.

Best three *Pumpkins*, to AUGUSTUS FREDERICK. Very handsome mammoth variety, weighing nearly 100 lbs. each, \$2.

A number of very large *Squashes* were exhibited, but not for competition.

Best six *Beets*, to J. ADAMS. Long blood variety, \$1. Several lots of enormously large mangel wurtzels and sugar beets were exhibited; also some of the new early turnip rooted variety, called *Bassano Beet*, from the garden of WM. R. SMITH, of Macedon.

Best six *Parsnips*, to THEODORE BACKS, \$1.

Best *Turnips*, to WILLIAM WEBB. Several kinds, very fine, \$1.

Best *Onions*, to WILLIAM HAMILTON. Very large and fine shaped, \$1.

Best *Celery*, to RICHARD COOPER. No competition; but very fine—discretionary premium, \$1.

Among the vegetable curiosities, were some *Seven Year Pumpkins*, exhibited by M. B. BATHAM, some of which were raised in 1837, and some in 1838. They appeared as fresh as though just taken from the vines, and bid fair to complete the seven years. They are kept in the Seed Store.

OF FRUIT.

The display consisted mostly of *Apples* and *Quinces*. These were very plenty, and of great beauty and excellence. The premium for the best dozen *Apples*, was awarded to JOSIAH HOWELL, of Chili, for a dish of twenty-ounce apples, weighing over one pound each, well ripened, and of good flavor, \$1.

A large assortment of splendid apples were exhibited from the gardens of WM. PITKIN, E. M. PANSON, ALEX. KELSEY, CHS. FILER, N. HAYWARD, M. GARRETT, and others.

For the best dozen *Peaches*, to H. M. WARD, for very large Orange Clingstones, well kept, \$1.

Mr. N. HAYWARD exhibited fine *Malacatos*.

For the best dozen *Quinces*, to J. W. SEWARD, \$1. The display of Quinces was very fine. They were offered by TITUS GOODMAN, N. DRAFER, ZERR BERR, E. MOORE, J. H. ROBINSON, ALEX. KELSEY Mrs. MATHES, and several others.

Only a few specimens of *Grapes* were exhibited.—The premium was awarded to CHS. FILER, for a fine lot of *Isabellas*.

Some beautiful *Oranges* and *Lemons* were exhibited by Capt. STUART MENTEITH, raised in his Green House at Canandaigua. They were very much admired—discretionary premium of \$2.

Some *Pears* were exhibited; but none deemed worthy of a premium. (The *Blight* has destroyed most of the pear trees in this vicinity.)

Some beautiful small, oval, yellow *Tomatoes* were exhibited by Mr. H. O'REILLY, (called, by him, *Tomatinos*.) and were much admired.

OF FLOWERS.

The display was very good, considering the lateness of the season. Indeed, were it not for the remarkably mild weather with which a kind Providence has favored us, these most beautiful of His works would not have ornamented our exhibition.

The most beautiful object of the exhibition was pyramid of Double *Dshilas*, about three feet high, arranged so as to display almost every variety of color in a beautiful combination. They were from the garden of ALEX. KELSEY, Esq., by whose taste they were so beautifully arranged. Premium, \$5.

The best dozen *Dahlias*, to Messrs. ELLWANOE & BARRY, Florists, \$2.

Best two bouquets of *Cat Flowers*, to Messrs. ELLWANOE & BARRY, \$2.

A fine lot of *Cat Flowers* were presented by MRS. CATHARINE BROOKS, and also by Mr. A. STONE.—The Hall was also ornamented by a beautiful collection of Green House plants, from Messrs. ELLWANOE & BARRY, and from WM. KING, Florist.

The whole exhibition afforded abundant evidence of the unusual productiveness of the earth during the past season; and of the beneficent care of that watchful Being who "maketh his sun to shine on the evil and the good, and watereth the hills from His chambers, so that the earth is satisfied with the fruit of His hands."

GEO. BEECHEER.

JAS. W. SMITH.

STUART MENTEITH.

Committee

DOMESTIC ARTS.

The exhibition of articles of domestic industry was quite interesting, although not very extensive. The

specimens of *Silk* and *Silk Goods*, were numerous and very beautiful.

The premium for the best *recol* *Rare Silk* was awarded to THURGOOD BACKUS, of Rochester, \$10.

Best *Saving Silk*, to JOHN ADAMS, of Ogden, \$10.

Best three lbs. of *Cocoons*, to do. \$5.

Best *Silk Hose*, to T. BACKUS, \$5.

MR. BACKUS exhibited a variety of silk articles, such as *Purses*, *Mitts*, &c., displaying much skill and industry, and highly creditable to himself and family.

MR. C. FILLIS, of Greece, also exhibited some beautiful *Silk Purses*, *Mitts*, *Hose*, &c. Discretionary premium, \$5.

But the finest specimen of female skill and industry, was a piece of *Figured Silk Lace*, manufactured from the cocoons, by MRS. M. GARRETT, of Gates. Discretionary premium, \$3.

MR. ZERA BURN, of Ferrinton, exhibited a few skeins of fine *Sewing Silk*, made by his daughter, BERNICE, only twelve years of age. Discretionary premium, \$1.

Of *Domestic Flannel*, several very good specimens were exhibited. The premium for the best was awarded to MR. CHURCH, of Riga, \$5.

MR. WM. STERNBERG of Henrietta, exhibited some very good *Bleached Linen Cloth*, and beautiful *Corcelids*, all fine specimens of female industry. Discretionary premium, \$3.
